

INQUIRY INTO SATELLITE AND MISSILE PROGRAMS

HEARINGS

BEFORE THE

PREPAREDNESS INVESTIGATING SUBCOMMITTEE

OF THE

COMMITTEE ON ARMED SERVICES

UNITED STATES SENATE

EIGHTY-FIFTH CONGRESS

FIRST AND SECOND SESSIONS

**NOVEMBER 25, 26, 27, DECEMBER 13, 14, 16, AND 17, 1957,
JANUARY 10, 13, 15, 16, 17, 20, 21, AND 23, 1958**

PART I

Printed for the use of the Committee on Armed Services

COMMITTEE ON ARMED SERVICES

RICHARD B. RUSSELL, Georgia, *Chairman*

HARRY FLOOD BYRD, Virginia
LYNDON B. JOHNSON, Texas
ESTES KEFAUVER, Tennessee
JOHN STENNIS, Mississippi
STUART SYMINGTON, Missouri
HENRY M. JACKSON, Washington
SAM J. ERVIN, Jr., North Carolina

LEVERETT SALTONSTALL, Massachusetts
STYLES BRIDGES, New Hampshire
RALPH E. FLANDERS, Vermont
MARGARET CHASE SMITH, Maine
FRANCIS CASE, South Dakota
PRESCOTT BUSH, Connecticut
FRANK A. BARRETT, Wyoming

THE PREPAREDNESS INVESTIGATING SUBCOMMITTEE OF THE COMMITTEE ON ARMED SERVICES

LYNDON B. JOHNSON, Texas, *Chairman*

ESTES KEFAUVER, Tennessee
JOHN STENNIS, Mississippi
STUART SYMINGTON, Missouri

STYLES BRIDGES, New Hampshire
LEVERETT SALTONSTALL, Massachusetts
RALPH E. FLANDERS, Vermont

EDWIN L. WEISL, *Chief Special Counsel*

CYRUS R. VANCE, *Special Counsel*

EDWIN L. WEISL, Jr., *Assistant Special Counsel*

GERALD W. SIEGEL, *Counsel*

SOLIE HORWITZ, *Counsel*

STUART FRENCH, *Counsel*

DANIEL F. MCGILLICUDDY, *Counsel*

CONTENTS

	Page
Opening statement, Senator Lyndon B. Johnson, chairman	1
Dr. Edward Teller, physicist, University of California Radiation Laboratory	4
Dr. Vannevar Bush, chairman of the corporation of the Massachusetts Institute of Technology	57
Dr. John Chipman, chairman, Department of Metallurgy, MIT	89
Gen. James H. Doolittle, USAFR, Chairman, Scientific Advisory Board, United States Air Force	111
Dr. John Hagen, Director, United States Navy Project Vanguard	142
Hon. Neil H. McElroy, Secretary of Defense	194
Hon. Donald A. Quarles, Deputy Secretary of Defense	261
Address by Hon. Donald A. Quarles before the United States Conference of Mayors, New York, N. Y., September 9, 1957	296
Remarks by Hon. Donald A. Quarles before the Wings Club, New York, N. Y., November 18, 1957	300
Appearance of Hon. Donald A. Quarles on TV Program Youth Wants to Know, November 10, 1957	303
Mr. William M. Holaday, Director of Guided Missiles, Office of the Secretary of Defense	345
Brig. Gen. Austin W. Betts, USA, military executive assistant to Director of Guided Missiles, Office of the Secretary of Defense	345
Mr. Alvin G. Waggoner, civilian executive assistant to Director of Guided Missiles, Office of the Secretary of Defense	345
Hon. Wilber M. Brucker, Secretary of the Army	461
Gen. Maxwell D. Taylor, USA, Chief of Staff, United States Army	475
Lt. Gen. James M. Gavin, USA, Chief of Office of Research and Development, Office of the Chief of Staff, United States Army	485
Maj. Gen. John B. Medaris, USA, Commander, Army Ballistic Missile Agency	539, 1066
Dr. Wernher von Braun, Director, Development Operations Division, Army Ballistic Missile Agency	579
Dr. William H. Martin, Director of Research and Development, Office of the Secretary of the Army	626
Hon. Thomas S. Gates, Jr., Secretary of the Navy	638, 711
Adm. Arleigh A. Burke, USN, Chief of Naval Operations, United States Navy	644, 753
Lt. Gen. Verne J. McCaul, USMC, Assistant Commandant, United States Marine Corps	669
Brig. Gen. Samuel R. Shaw, USMC, Deputy Chief of Staff (Research and Development) United States Marine Corps	677
Hon. Garrison Norton, Assistant Secretary of the Navy (Air)	682
Rear Adm. Rawson Bennett, USN, Chief of Naval Research	703
Rear Adm. John T. Hayward, USN, Assistant Chief of Naval Operations (Research and Development)	703
Rear Adm. Charles E. Weakley, USN, Director, Office of Anti-submarine Warfare Readiness, Office of Chief of Naval Operations	736
Rear Adm. John E. Clark, USN, Director, Guided Missiles Division, Office of Chief of Naval Operations	748
Rear Adm. William F. Raborn, USN, Director, Special Project, Bureau of Ordnance, United States Navy	771, 834
Dr. J. Sterling Livingston, professor of business administration, Harvard University	791
Hon. James H. Douglas, Secretary of the Air Force	839
Gen. Thomas D. White, USAF, Chief of Staff, United States Air Force	839
Gen. Curtis E. LeMay, USAF, Vice Chief of Staff, United States Air Force	900

	Page
Lt. Gen. Donald E. Putt, USAF, Deputy Chief of Staff (Development), United States Air Force	926
Lt. Gen. Clarence S. Irvine, USAF, Deputy Chief of Staff (Materiel), United States Air Force	951
Hon. Richard E. Horner, Assistant Secretary of the Air Force (Research and Development)	977
Maj. Gen. Bernard A. Schriever, USAF, Commander, Air Force Ballistic Missile Division	989
Hon. Nelson A. Rockefeller, chairman, Rockefeller Brothers Fund, Inc.	1006
Brig. Gen. David Sarnoff, chairman of the board, Radio Corporation of America	1070
Mr. Robert E. Gross, chairman of the board and president, Lockheed Aircraft Corp.	1106
Mr. L. Eugene Root, Vice President, Lockheed Aircraft Corp.	1106
Mr. R. A. Bailey, chief, advanced systems research engineer, California division, Lockheed Aircraft Corp.	1106
Hon. Dan A. Kimball, president, Aerojet General Corp.	1134
Mr. Lawrence A. Hyland, vice president and general manager, Hughes Aircraft Co.	1158
Mr. R. J. Shank, vice president, engineering, Hughes Aircraft Co.	1158
Mr. Roy T. Hurley, chairman of the board and president, Curtiss-Wright Corp.	1180
Col. Thomas G. Lanphier, Jr., vice president, Convair division, General Dynamics Corp.	1201
Mr. James R. Dempsey, manager, Astronautics division, General Dynamics Corp.	1201
Dr. Krafft A. Ehricke, chief, planning for space development, Convair division, General Dynamics Corp.	1201
Mr. Donald W. Douglas, Sr., chairman of the board, Douglas Aircraft Co.	1232
Mr. Donald W. Douglas, Jr., president, Douglas Aircraft Co.	1232
Mr. Robert L. Johnson, assistant chief missiles engineer, Douglas Aircraft Co.	1232
Mr. William E. Allen, president, Boeing Airplane Co.	1256
Mr. James H. Kindelberger, chairman of the board, North American Aviation, Inc.	1274
Major Alexander de Seversky, aeronautical consultant	1297
Adm. Chester W. Nimitz, USN (retired), former Chief of Naval Operations	1311
Gen. Carl Spaatz, USAF (retired), former Chief of Staff, United States Air Force	1333
Mr. F. O. Detweiler, president, Chance Vought Aircraft, Inc.	1352
Mr. S. O. Perry, Jr., chief engineer, missiles, Chance Vought Aircraft, Inc.	1352
Gen. Lucius D. Clay, USA (retired), chairman of the board, Continental Can Co.	1362

ALPHABETICAL LIST OF PRINCIPAL WITNESSES

Allen, Mr. William E., president, Boeing Airplane Co.	1256-1274
Bailey, Mr. R. A., chief advanced systems research engineer, California division, Lockheed Aircraft Corp.	1106-1134
Bennett, Rear Adm. Rawson, USN, Chief of Naval Research	703-790
Betts, Brig. Gen. Austin W., USA, military executive assistant to Director of Guided Missiles, Office of the Secretary of Defense	345-460
Brucker, Hon. Wilber M., Secretary of the Army	461-474
Burke, Adm. Arleigh A., USN, Chief of Naval Operations, United States Navy	644-666, 753-790
Bush, Dr. Vannevar, chairman of the corporation of the Massachusetts Institute of Technology	57-89
Chipman, Dr. John, chairman, Department of Metallurgy, MIT	89-108
Clark, Rear Adm. John E., USN, Director, Guided Missiles Division, Office of Chief of Naval Operations	748-790
Clay, Gen. Lucius D., USA (retired), chairman of the board, Continental Can Co.	1362-1377
Dempsey, Mr. James R., manager, astronautics division, General Dynamics Corp.	1201-1229
De Seversky, Maj. Alexander, aeronautical consultant	1297-1310
Detweiler, Mr. F. O., president, Chance Vought Aircraft, Inc.	1352-1359

	Page
Doolittle, Gen. James H., USAFR, Chairman, Scientific Advisory Board, United States Air Force	111-141
Douglas, Mr. Donald W., Jr., president, Douglas Aircraft Co	1232-1255
Douglas, Mr. Donald W., Sr., chairman of the board, Douglas Aircraft Co	1232-1255
Douglas, Hon. James H., Secretary of the Air Force	839-898
Ehrlicke, Dr. Krafft A., chief, planning for space development, Convair division, General Dynamics Corp	1201-1229
Gates, Hon. Thomas S., Jr., Secretary of the Navy	638-644, 711-790
Gavin, Lt. Gen. James M., USA, Deputy Chief of Office of Research and Development, Office of the Chief of Staff, United States Army	485-536
Gross, Mr. Robert E., chairman of the board and president, Lockheed Aircraft Corp	1106-1134
Hagen, Dr. John, Director, United States Navy Project Vanguard	142-191
Hayward, Rear Adm. John T., USN, Assistant Chief of Naval Operations (Research and Development)	703-790
Holaday, Mr. William M., Director of Guided Missiles, Office of the Secretary of Defense	345-460
Horner, Hon. Richard E., Assistant Secretary of the Air Force (Research and Development)	977-988
Hurley, Mr. Roy T., chairman of the board and president, Curtiss-Wright Corp	1180-1201
Hyland, Mr. Lawrence A., vice president and general manager, Hughes Aircraft Co	1158-1177
Irvine, Lt. Gen., Clarence S., USAF, Deputy Chief of Staff (Materiel), United States Air Force	951-976
Johnson, Mr. Robert L., Assistant Chief Missiles Engineer, Douglas Aircraft Co	1232-1255
Kimball, Hon. Dan A., president, Aerojet General Corp	1134-1158
Kindeberger, Mr. James H., chairman of the board, North American Aviation, Inc	1274-1295
Lanphier, Col. Thomas G., Jr., vice president, Convair division, General Dynamics Corp	1201-1229
LeMay, Gen. Curtis E., USAF, Vice Chief of Staff, United States Air Force	900-925
Livingston, Dr. J. Sterling, professor of business administration, Harvard University	791-834
Martin, Dr. William H., Director of Research and Development, Office of the Secretary of the Army	626-638
McCaul, Lt. Gen. Verne J., USMC, Assistant Commandant, United States Marine Corps	669-681
McElroy, Hon. Neil H., Secretary of Defense	194-261
Medaris, Maj. Gen. John B., USA, Commander, Army Ballistic Missile Agency	539-596, 1066-1067
Nimitz, Adm. Chester W., USN (retired), former Chief of Naval Operations	1311-1332
Norton, Hon. Garrison, Assistant Secretary of the Navy (Air)	682-734
Perry, Mr. S. O., Jr., chief engineer, missiles, Chance Vought Aircraft, Inc	1352-1359
Putt, Lt. Gen. Donald E., USAF, Deputy Chief of Staff (Development), United States Air Force	926-950
Quarles, Hon. Donald A., Deputy Secretary of Defense	261-342
Address by Hon. Donald A. Quarles before the United States Conference of Mayors, New York, N. Y., September 9, 1957	296-300
Remarks by Hon. Donald A. Quarles before the Wings Club, New York, N. Y., November 18, 1957	300-303
Appearance of Hon. Donald A. Quarles on TV program Youth Wants To Know, November 10, 1957	303-309
Raborn, Rear Adm. William F., USN, Director, Special Project, Bureau of Ordnance, United States Navy	771-790, 834-835
Rockefeller, Hon. Nelson A., chairman, Rockefeller Brothers Fund, Inc	1006-1066
Root, Mr. E. Eugene, vice president, Lockheed Aircraft Corp	1106-1134
Sarnoff, Brig. Gen. David, chairman of the board, Radio Corporation of America	1070-1103
Schriever, Maj. Gen. Bernard A., USAF, Commander, Air Force Ballistic Missile Division	989-1004

	Page
Shank, Mr. R. J., vice president, engineering, Hughes Aircraft Co.	1158-1177
Shaw, Brig. Gen. Samuel R., USMC, Deputy Chief of Staff (Research and Development), United States Marine Corps	677-681
Spaatz, Gen. Carl, USAF (retired), former Chief of Staff, United States Air Force	1333-1350
Taylor, Gen. Maxwell D., USA, Chief of Staff, United States Army	475-484
Teller, Dr. Edward, physicist, University of California Radiation Laboratory	4-57
von Braun, Dr. Wernher, Director, Development Operations Division, Army Ballistic Missile Agency	579-632
Waggoner, Mr. Alvin G., civilian executive assistant to Director of Guided Missiles, Office of the Secretary of Defense	345-460
Weakley, Rear Adm. Charles E., USN, Director, Office of Anti-submarine Warfare Readiness, Office of Chief of Naval Operations	736-747
White, Gen. Thomas D., USAF, Chief of Staff, United States Air Force	839-898

INQUIRY INTO SATELLITE AND MISSILE PROGRAMS

MONDAY, NOVEMBER 25, 1957

UNITED STATES SENATE,
PREPAREDNESS INVESTIGATING SUBCOMMITTEE
OF THE COMMITTEE ON ARMED SERVICES,
Washington, D. C.

The subcommittee met, pursuant to call, at 10:05 a. m., in room 318, Senate Office Building, Senator Lyndon B. Johnson (chairman of the subcommittee) presiding.

Present: Senators Johnson (Texas), presiding, Kefauver, Stennis, Symington, Saltonstall, and Flanders.

Also present: Senators Smith (Maine), Case (South Dakota), Barrett, and Bush, members of the Committee on Armed Services; Senators Carroll and Dirksen;

Edwin L. Weisl, special counsel; Cyrus R. Vance, associate counsel; Gerald W. Siegel, associate counsel; Solis Horwitz, associate counsel Daniel F. McGillicuddy, Jr., associate counsel; Stuart P. French, associate counsel; George Bunn, associate counsel; Edwin L. Weisl, Jr., assistant special counsel; William V. Houston, consultant, and Dr. Homer J. Stewart, consultant;

Dr. Edward C. Welsh, assistant to Senator Symington.

Senator JOHNSON. Please come to order.

First, I want to welcome the members of the Armed Services Committee to this meeting of the Preparedness Subcommittee of the Armed Services Committee.

The Preparedness Subcommittee is made up of seven members: Senator Johnson of Texas, Senator Kefauver, Senator Stennis, Senator Symington, Senator Bridges, Senator Saltonstall, and Senator Flanders.

Each member of the Armed Services Committee is an ex officio member of the Preparedness Subcommittee. That subcommittee was set up in 1950, and has been operating under authorization of the Senate since that time.

We particularly welcome Senator Smith and Senator Bush, Senator Barrett, and Senator Case, to our deliberations. And when the questioning begins, the committee has decided that we will follow this procedure: The members will question witnesses in order of their seniority, whether they are members of the subcommittee or of the full committee.

We are delighted that you could be here with us, and we hope that you can attend most of our sessions.

We are here today to inquire into the facts on the state of the Nation's security. Our country is disturbed over the tremendous military and scientific achievement of Russia. Our people have believed that in the field of scientific weapons and in technology and science, that we were well ahead of Russia.

With the launching of Sputniks I and II, and with the information at hand of Russia's strength, our supremacy and even our equality has been challenged. We must meet this challenge quickly and effectively in all its aspects.

Members of the Preparedness Subcommittee's staff began to assemble information within hours after the first satellite was announced, in order to be ready for this hearing.

On November 4, the chairman and the ranking minority member, Mr. Bridges, of the Senate Armed Services Committee, and the chairman of the Preparedness Subcommittee, were briefed at the Pentagon.

The facts which were brought before us during that briefing gave us no comfort. It was decided on the following day that there should be a full, complete, and exhaustive inquiry into the state of our defenses and the steps that would have to be taken.

To direct that inquiry, we secured the services of an eminent and distinguished attorney, Edwin L. Weisl, of New York City. With other members of the committee staff, Mr. Weisl has interviewed many people under the direction of the committee.

The witnesses who will appear today were selected as a result of those interviews.

It is the consensus of the scientific community that these witnesses are extremely well qualified to present the physical facts of the situation with which we are confronted.

We are particularly pleased to have as consultants to this committee Dr. William Houston, president of Rice Institute at Houston, Tex., and Dr. Homer J. Stewart, of California, of Cal Tech.

We have decided to begin the hearings with scientific witnesses because we felt that our people should know exactly what we are talking about.

The newspapers have been filled with columns about satellites and guided missiles, but nowhere is there a record that brings together in one place precisely what these things are and exactly what they mean to us.

We hope to produce that kind of record today.

We hope that when the testimony is finished, we will have a clear definition of the present threat to our security, perhaps the greatest that our country has ever known. When we conclude with the scientific witnesses, we will examine the known information on Soviet and American capabilities. This testimony will necessarily be highly classified.

There are a few things I wish to make clear about the committee's attitude.

It would appear that we have slipped dangerously behind the Soviet Union in some very important fields. But the committee is not rendering any final judgments in advance of the evidence, on why we slipped or what should be done about it.

Our goal is to find out what is to be done. We will not reach that goal by wandering up any blind alleys of partisanship.

I suppose that all of us, being human, have some ideas on steps that should be taken. But the committee judgment will represent a meeting of the minds after all the facts are available, and this committee's judgment will represent an effort to make a contribution to the defense of our Nation.

The facts that I learned so far give me no cause for comfort. I do not feel that they must be withheld from the public. I feel that we need observe only the requirements of security, and these are requirements upon which sensible men can always agree.

It is not necessary to hold these hearings to determine that we have lost an important battle in technology. That has been demonstrated by the satellites that are whistling above our heads.

But to me, and I think to every other American, a lost battle is not a defeat. It is, instead, a challenge, a call for America to respond with the best that is within them.

There were no Republicans or Democrats in this country the day after Pearl Harbor. There were no isolationists or internationalists. And, above all, there were no defeatists of any stripe.

There were just Americans anxious to roll up their sleeves to close ranks and to wade into the enemy.

One of the witnesses, yesterday, compared the present situation to the challenge that faced America after Pearl Harbor. In some respects, I think it is an even greater challenge. In my opinion, we do not have as much time as we had after Pearl Harbor.

But we do have time, and we do have determination, and we do have willpower. I do not believe the facts will invite our people either to a siesta or to a hysteria. I believe the facts will inspire Americans to the greatest effort in American history.

And this committee seeks only to determine what can be done, what should be done, what must be done now and for the long pull.

The American people have the capacity to do it, and we are confident that they will do it.

Our first witness this morning is Dr. Edward Teller, one of our most most eminent physicists. For the benefit of the record, I would like to state some biographical data concerning Dr. Teller's qualifications.

Dr. Teller, who is generally known as the father of the H-bomb, is a professor of physics at the University of California Radiation Laboratory.

He was born in Budapest, Hungary, in 1908, and he was educated in Germany. In 1935 Dr. Teller came to the United States to accept the position as professor of physics at George Washington University.

He left this post in 1941 to join the staff of the Institute for Nuclear Studies at the University of Chicago. He served as a professor of physics at the University of Chicago from 1946 to 1949, and again from 1951 to 1953. In between these assignments, he was a staff member of the Los Alamos Scientific Laboratory in New Mexico.

He has been associated with the University of California Radiation Laboratory since 1952.

Dr. Teller, the members of this committee welcome you to this hearing. We are all familiar with the outstanding service that you have rendered this country in the field of nuclear energy and the field of basic research. We are eagerly looking forward to your testimony.

And now, in accordance with the rules of the committee, Dr. Teller, will you please rise, raise your hand, and take the oath.

Do you solemnly swear that the testimony you will give this committee will be the whole truth, and nothing but the truth?

Dr. TELLER. I do.

Senator JOHNSON. Be seated.

TESTIMONY OF DR. EDWARD TELLER

Senator JOHNSON. Now, Mr. Weisl, committee counsel, will you proceed with the witness?

Mr. WEISL. Yes, sir.

Dr. Teller, we realize that you have traveled night and day by air to get here for this hearing. And we also know that you have been working intensively at Los Alamos and the University of California Radiation Laboratory, in the interests of our Nation's security.

I am also aware of the fact that you are not well, and therefore if in the course of this examination you feel that you need a respite, I am sure the chairman will grant you a small recess.

Dr. TELLER. Thank you very much.

Mr. WEISL. Will you please tell us, Dr. Teller, briefly, what your relationship to atomic and thermonuclear weapons has been since your arrival in this country?

RELATIONSHIP WITH ATOMIC WEAPONS AND THERMONUCLEAR BOMBS

Dr. TELLER. Well, I arrived in this country in 1935. And at that time, of course, none of us dreamt of any such thing as a nuclear weapon. A short time after that, at the George Washington University here in town, working with my good friend, George Gamow, we discussed the energy sources of stars; and in connection with that we got interested in reactions between nuclei and we learned some apparently impractical facts which happened to be useful later.

The topic became really exciting at the end of 1938—January 1939 when we heard about the discovery of fission, and then I was gradually driven into the orbit of the Manhattan District. I worked first in Washington informally, then at Columbia University, then a little later and in a formal sense in the metallurgical laboratory in Chicago which was then the code name for our work on nuclear energy, and in the end during the war in Los Alamos.

At that time I was a little bit more concerned with advanced plans, and in this way I got very much interested—in fact from the very beginning, not only in fission, in the fission process but in the thermonuclear processes as well.

Then in 1949, after I had gotten back to Chicago, I decided to spend a little bit more time in Los Alamos where I had very many friends and where I felt the work is becoming more and more important. And then shortly after I got to Los Alamos, the Russians fired their first nuclear explosion, detected in this country; and at that time some of us, and I also, felt that this is the time to go ahead with some of the old plans which we had already formulated, and in this way we got into the work on thermonuclear reactions, on the hydrogen bomb, on which we were quite intensively working and which was then carried out in Los Alamos in a very brilliant way.

I went back from there to Chicago, but shortly after that, a second weapons laboratory had been organized in Livermore at the University of California. I had been invited to join that, and I felt at the time it was important that this country should have two independent laboratories, in spite of the fact that Los Alamos is so excellent. I think that both laboratories are working now in a most excellent fashion. And as I say, I was asked to join, and once I got into California, I found it hard to leave it again and I am still there.

Mr. WEISL. Have you participated very actively in the development of the hydrogen bomb?

Dr. TELLER. I have, yes, sir.

Senator JOHNSON. Could I interrupt a minute. Senator Symington is having trouble seeing the witness because of the photographers, and we have had a request to ask them to take their pictures and then move along.

Senator SYMINGTON. Mr. Chairman, if I may say so, my interest is more in the witness than it is in the photographers. If the witness is satisfied——

Senator JOHNSON. We cleared that with Dr. Teller, and it was agreeable to him to have the pictures made by them.

Senator SYMINGTON. I will not in any way, Mr. Chairman, object to the photographers if they do not bother the witness.

Senator JOHNSON. I understood from the counsel they were bothering you.

Senator SYMINGTON. I think the witness and counsel misunderstood me.

Dr. TELLER. I would like to say the picture taking is not bothering me, but indeed I would be a little bit more comfortable if I could talk directly to you without going over the head of the photographers.

Could you take the pictures from the side so it would be more private.

Senator JOHNSON. Would the photographers take official notice of that request, and after you have taken your pictures, move over to the side so as not to obstruct the Senators. Get your pictures as soon as you can and let us proceed with the hearing, please.

FISSIONABLE AND THERMONUCLEAR MATERIAL AND LONG-RANGE AND INTERMEDIATE MISSILES

Mr. WEISL. Dr. Teller, will you please tell the committee the relationship between fissionable and thermonuclear material and the long-range and intermediate missiles?

Dr. TELLER. An intermediate missile, of course, is a missile with quite a long range. I think everybody knows today that an intermediate missile is one that is fired perhaps at a distance of 1,500 miles; and an intercontinental or really long-range missile is one that is fired at a distance of 5,000 miles or so. And furthermore, the names of these instruments, ballistic missiles, means that they are sent out, put on a course, and after that, they just hit what they do hit. And you have to try to put them on course rather accurately to begin with.

Now, to hit within a few feet when you have started from 5,000 miles or even from 1,500 miles is, of course, something which is actually impossible. And if you should shoot at such great distances, then you are not going to hit your target very accurately. Therefore, it is quite important for these long-range missiles to be armed with explosives which themselves have quite a range of effectiveness. And therefore, the more powerful explosives we have, the more practical these missiles become.

WARHEADS

At the same time, of course, it is no small thing to shoot over such long distances. A great deal of power is required and again, there-

fore, the lighter we can make these explosives or these warheads, the easier is the job of the missile man. Therefore, there is indeed very close connection between the two fields, if that may be a sufficient answer.

Mr. WEISL. In other words, without the warhead and the explosive power in the warhead, the long-range missile would not be very useful?

Dr. TELLER. As far as we see now, and as far as I can imagine, this is so.

Mr. WEISL. When did you discover, or when did you and your associates discover, that you could reasonably expect to have a powerful explosive warhead that would suit a long-range missile?

Dr. TELLER. I would, in a way, like to ask not to answer this question in this form for several reasons. But the most strong, the strongest reason is that such a discovery, such a realization, does not come all in one piece. It gradually grows on one. And let us say in 1945 I had an opinion on the subject, and in 1955 I had a different opinion on the subject. And in the meantime, our opinions changed, and how each change has occurred would be a long story.

But I would say this: that the development of the missiles has in actual fact, and at least to a very great extent, waited for the realization of a warhead. We did not go ahead and undertake a very vigorous program to developing long-range missiles before the time at which it was reasonably clear that a warhead was available. And by that time, I should say, it was practically too late. We had waited too long to reach this decision.

SOVIET PROGRESS

Mr. WEISL. As we get into the subject of the Russian development, you will testify as to what the Russians did in that respect.

In connection with the development of the thermonuclear explosive material, the question of dangerous fallout has been in the public's mind. Have you done any work, or have you and your associates done any work, to effect as nearly as possible a "clean" bomb?

Dr. TELLER. There has been quite a bit of work on the subject. I should like to say that initiative for the work of such a clean bomb has come from the Atomic Energy Commission itself, particularly from Commissioner Libby. Under his suggestion, we have started to work on this subject and in the laboratories this is now being pushed with very great vigor. For some types of bombs, we have developed clean types which are already quite effective in the sense that they cut out 95 percent of the radioactive dangerous substances.

This unfortunately does not apply to all types of bombs, and we are trying to apply these principles universally and trying to make the bombs as clean as we possibly can. This is a long-range development. And I think in the long run it may lead, I think it will lead, to the peaceful applications of nuclear explosives, because the moment you can make these bombs clean, you can just use them as more powerful explosives, and it is probably known to you that more high explosives have been used in peacetime than wartime.

Mr. WEISL. In what respect?

Dr. TELLER. Well, in engineering projects, in mining projects.

Mr. WEISL. In order to carry on experiments looking toward the perfection of a clean bomb, so to speak, you must have testing?

Dr. TELLER. It is absolutely necessary to have testing. You cannot hop along on one theoretical leg just as you cannot go along on the other purely experimental leg. You have got to get your ideas straight and then go out in the field and see how they work out.

SATELLITE MILITARY AND SCIENTIFIC SIGNIFICANCE

Mr. WEISL. Dr. Teller, the people of the United States were taken by surprise when they discovered that the Russians were able to launch a sputnik or a satellite into outer space and put it in orbit. Does the launching of such a satellite in outer space have any military and scientific significance?

Dr. TELLER. It has great military significance, because, among other things, it shows that the Russians are far along, very far along, in rocket development. But it has also some intrinsic military significance. In addition, it aids in all kinds of scientific developments because it allows us to find out a great number of things about outer space, and, looking back on earth, some of the properties of our own globe. It has great significance in both these directions.

Mr. WEISL. Would you like to discuss this scientific and military significance of the satellite at this time or would you like to wait until we get into the long-range planning that is necessary to meet the Russian threat?

Dr. TELLER. Whichever way you say, but it seems to me that if we can get back to long-range questions later, then at least the scientific significance of sputnik might be very well delayed until we get into long-range questions and perhaps after we have discussed what to do right away.

Mr. WEISL. Very well.

SOVIET PROGRESS IN SATELLITE LAUNCHING

Dr. Teller, in order to launch this satellite into outer space and put it in orbit, what did the Russians have to have in order to accomplish this feat?

Dr. TELLER. They have to have a very powerful rocket motor. To put up half a ton of material a thousand miles from the earth is a very respectable achievement, and this rocket motor is, of course, one of the main things that one needs in launching an intercontinental ballistic missile as well.

In addition, what they need is some sort of a guidance system. Now, to put a satellite into an orbit, into a reasonably well-defined orbit, does not need as fine a guidance as you need if you want to hit a target at a great distance, but it needs a reasonably advanced type of guidance, and therefore the things needed for the satellite are quite close to the requirements for intercontinental ballistic missiles as well.

Senator JOHNSON. Could we ask the photographers to please leave the front of the table?

Proceed, counsel.

Mr. WEISL. Dr. Teller, does it also indicate that they have a form of propulsion, either solid or liquid, that is necessary to launch this heavy satellite?

Dr. TELLER. It certainly means that. That is just proven by the fact of the satellite clearly. Of course, we do not have a direct and complete proof that Sputnik II indeed was half a ton. What little I could find out from our own observation is in agreement with this claim, and the Russian claims in this general direction have proved so far correct, and I think it would be a great mistake to proceed under the assumption that they are only bluffing.

Mr. WEISL. Then you believe that the Russians have an intercontinental ballistic missile at this time?

Dr. TELLER. Well, I certainly do not know, I cannot say it with complete certainty, but I would like to say this: They have said that they have the weapon. There is every reason to believe that they have it at least in the stage where they have constructed it and tested it. As to what extent they have numbers of them, to what extent they have the operational capability, of that I have no knowledge whatsoever, and I hope that as yet they do not have such an operational capability.

Mr. WEISL. Dr. Teller, in the Friday edition of the New York Times a report stated that your colleague, Dr. Ernest Lawrence, who is a Nobel Prize winner and one of the great contributors to our nuclear development, stated that the launching of a heavy satellite by Russia indicated to him they had an intercontinental ballistic missile that could pinpoint or hit Houston, Tex.

Do you believe that that is a fair inference to be drawn from the launching of the satellite?

Dr. TELLER. Yes, sir. I would perhaps elaborate on it in this way.

Mr. WEISL. Please do.

Dr. TELLER. I am not considering either Houston, Tex., or the area that a satellite affects precisely as a pinpoint.

Mr. WEISL. He happened to be speaking in Houston at the time, and that is why he used the example of Houston, Tex.

Dr. TELLER. But I would like to say this: I do not think that we know enough about the Russian guidance system to be able to say so with definiteness; at least, I do not know enough to be able to say with definiteness that they have the required accuracy at the present moment. However, if you just consider the kind of difficulties which such a system has, and if they have done what they have accomplished to date, then either they have the ability to hit Houston, Tex., now, or they will have this ability in a rather short time. And, certainly, the possibility that this will happen we shall disregard at our greatest peril.

Mr. WEISL. Dr. Teller, what must the Russians have in their long-range guided missile, in addition to their ability to put a satellite in outer space, in order to hit a target?

Dr. TELLER. They must have a better guidance system. I do not mean better, compared to what they have now, because I do not know what they have now, so I cannot make a comparison. But in order to hit a target, they have to have a better guidance system than they must have in order to put something into a satellite orbit. And secondly, they have to solve the problem of reentry of the satellite into the atmosphere.

MISSILE REENTRY

Mr. WEISL. You might explain—excuse me.

Dr. TELLER. You see, when the missile is shot out, it is being accelerated and acceleration is continued outside the atmosphere. Therefore, when the missile is on its way up, it still goes relatively slowly, although, in fact, it goes fast enough; but on the way back the missile comes in at full speed, and then unless you are careful what you do the first contact with atmosphere will destroy the missile.

Now, this problem of reentry is a problem which is not too easy, but also it is one which I think is solvable and I have no doubt that both ourselves and the Russians can solve it.

What we have done in the field, I cannot say for two reasons. One is that I do not know sufficiently the details, and, second, the details are classified. What the Russians have done in this field, I just simply do not know. But I am sure that it is a solvable problem, and for all I know, they may have solved it already.

Mr. WEISL. Do you believe it is safe and reasonable for us to assume that they have solved it?

Dr. TELLER. It is safe and reasonable to assume that; yes, sir.

WHY WE ARE BEHIND RUSSIANS

Mr. WEISL. Dr. Teller, why do you believe we are behind the Russians in the development of the long-range missile?

Dr. TELLER. That is something of a long story; and may I take the patience of the committee to answer it in more than just a few words?

Senator JOHNSON. Yes.

Dr. TELLER. I would like to say that there is a special reason, and there is a general reason.

The special reason I have already tried to indicate. The special reason is that we have not embarked on a really vigorous missile program before we had clear and definite evidence what we shall do with such a missile, how such a missile can be used.

Let me make this a little bit more complete. In 1946, right after the end of the war, we could have said: Let us develop ballistic missiles. One can go big distances, they are extremely interesting developments, some important wartime usefulness has been demonstrated by the German V-2.

Well, we did go into the development of ballistic missiles, but at an exceedingly slow and small rate. We did not start a vigorous development because it could not be proved that these missiles will be really important in the next war. We did not, if the next war comes, we did not have the really powerful explosive that would be needed in the warhead of such a missile.

Years later we finally realized that a system consisting of a guided missile and a warhead, which in the meantime has been developed, would indeed be an extremely powerful weapon. Therefore, we have determined to start a very vigorous program on the ballistic missile.

When we started this program, we went into it with quite a bit of energy and I think the efforts have paid off, and I have nothing to say about that program that would not bear out that it has been an excellent and excellently managed program, but it came too late.

The Russians have started on their ballistic-missile program, from all we know, right after the war, and they kept at it. Why they did it? Well, I think there are two reasons: One very obvious reason is that they are interested in closer targets than we are and therefore the missile made sense to them at an earlier time.

But I think that we have evidence that the Russians are willing to take greater gambles in their development program than we are, and this is an important general point which I would like to explain.

There is excellent work in this country on the kind of investigation which one man or a few people can do. We do good work, both in pure science and in the investigation of applied possibilities as long as such investigation does not cost too much. Also, we have done reasonably well in big projects where we know precisely where we are going, where we know that there is a payoff, and we have shown frequently in the past that we can spend a billion dollars or billions of dollars if it is really necessary.

EXPENDITURES

But there is one area in which we are not doing so well. When it comes to spending \$10 million or \$50 million to begin to develop an area about which we do not yet know for certain that it will pay off, but about which there is a reasonable presumption that somehow or other it is going to pay off, in this intermediate range of practical research, we have been rather poor. Really substantial amounts of money are not available unless we can prove in black and white that it is something that is absolutely necessary. We are not taking the kind of risks which in war, in cold war as well as in hot war, one necessarily has to take. And we have plenty of evidence that the Russians have taken that kind of risk.

Now, I would like to say one last word. The ballistic-missile race in which we very clearly appear to be not in the lead, where the Russians are ahead of us, is only one special case, and the trouble is a more general one.

NUCLEAR WEAPONS

At the end of the war, we had a monopoly on nuclear weapons, a monopoly on nuclear energy. The Russians, if I estimate the situation correctly, have not caught up with us, but they have closed the gap in an alarming fashion. In airplane construction, they were just nowhere at the end of the war. Today, I am again not the expert to argue whether they are behind us or whether they are ahead of us, but certainly what they do is fully comparable to what we are doing.

In ballistic missiles, they are, I think, according to all the simple evidence that one can see, ahead of us. In radar, we had a most impressive lead. I doubt very much that we have this lead now. We may have lost it or not, I do not know the details. There is no doubt that since the end of the war the Russians have worked at a much faster rate; much more effectively in all fields of application of technology to the advanced military systems, and if the relative efforts continue, as they have been since the war, there is no doubt that in a few more years the Russians will leave us behind and way behind.

WHAT THE UNITED STATES SHOULD BE DOING

Mr. WEISL. Dr. Teller, looking again at the immediate danger and the short-range program, have you any opinion as to what the United States should be doing now to meet the danger?

Dr. TELLER. Well, I would say that the immediate danger very obviously is in the missile field.

As I have said, we have a very healthy missile program, and we had it for a few years.

First of all, I would like to say what I would not do. I think that I would not recommend to embark on a rapid reorganization of the effort. This could rock the boat so that our effort might actually be retarded rather than advanced.

At the same time, I would say that I am sure that the effort, which is an excellent effort as it stands today, is not good enough. I am quite sure that once an emergency has become clear to the American people, as this emergency has become clear, there are ways and means by which further acceleration is possible.

One very important thing will be that we must be generous with money, and that we must apply more money to the program in any place where it can be applied in an effective manner, and there are many such places.

May I please ask permission to answer this question a little bit more explicitly, but in an oblique manner?

My main field is not that of missiles. If you ask me too closely how to accelerate the missile program, I will honestly have to answer "I do not know." My specialty is nuclear weapons.

LOS ALAMOS

I have just returned from a trip to Los Alamos, where I had worked, where I have many friends, and where I am not working now, but I was there on a visit, on an official visit.

Now, I wondered whether I can use the Los Alamos situation, what I have just seen there in the past few days, to illustrate what I mean, even though it is not squarely in the line of your investigation. Is that permissible?

Senator JOHNSON. Yes. Go ahead.

Dr. TELLER. I would like to say this: In Los Alamos you have a group of really good experts who are working in a field in which we are still in the lead, but in which we may be losing the lead if we don't do more.

Now, I find that, and there is no doubt about it, this very important laboratory is suffering from a shortage of funds.

Mr. WEISL. From a what? I did not hear it.

Dr. TELLER. From a shortage of funds, money.

I have not looked into their books, and I cannot tell you precisely how big the budget is, and this is not perhaps a topic of discussion here. But I will say this: that the budget in Los Alamos is somewhere in the neighborhood of \$50 million a year.

Now, in asking around and in talking with people—and here I talk from quite a bit of experience—I am quite sure that it is badly needed to increase the budget of Los Alamos from \$50 million right away to \$55 million.

I am not talking, therefore, in this case of a great expansion of the expenditures.

I furthermore would like to say that Los Alamos and the atomic-energy field in general is in a somewhat favored position. The appropriations have been more generous in the atomic-energy field than in many other fields. And furthermore, the Atomic Energy Commission has done an excellent job in supporting, in the right proportion, its various laboratories.

I am not making a special case of Los Alamos. I am using it as an example because I have just been there, I have seen a simple and clear need where an added expenditure of 10 percent will increase the effort by much more than 10 percent, where it will make it possible to adapt the program to newly arising needs, where it will make it possible to attract to Los Alamos the kind of people and keep in Los Alamos the kind of people who must go there and who must continue to work there.

I think that unless such reasonable expenditures are made right away in fields like atomic energy and also, I am sure, the missile field, we will have fallen far short of the kind of response which we should make to the present situation.

Mr. WEISL. Has the request for this additional 10 percent been made and denied?

Dr. TELLER. I do not know in precisely what state this is. I am quite sure that the Atomic Energy Commission is fully aware of the needs at Los Alamos, and I am sure that they are trying their very best to supply this need.

Now, in precisely which stage of the complicated process things have bogged down, I mean the complicated process of making money available, I do not know. I am quite sure that I am probably the least expert on these financial matters here in this room.

I only know that the need is there, and that the need has not been supplied; and, in fact, the effect of sputnik has not shown itself yet as a change in the situation in this particular case.

I raised the question, "Didn't sputnik make a difference?" And the people in Los Alamos told me, "As yet, we have not seen that difference."

Now, I am sure it is not their fault. I am sure it is not the fault of the Atomic Energy Commission. I don't want to say where the fault lies. I am hopeful that there is no fault anywhere, and that a few more weeks will see the matter and similar matters in a better shape.

Mr. WEISL. What other suggestions have you, Dr. Teller, to accelerate our present effort to meet the danger that we face?

Dr. TELLER. I have no very specific suggestions. I would think that you have here a most excellent opportunity to find out from the companies which are working on this project, and from other companies which would like to be working on the project, and which have available manpower, you can find out from them what kind of additional efforts are possible without dislocating other efforts.

Because I feel very strongly that across the board, everybody is most eager to go ahead with the program, and that we must go ahead with it, we must accelerate, without stopping other efforts.

COOPERATION AND COMPETITION

I have perhaps this one specific suggestion which I am also sure does not require any great wisdom, and everybody is aware of it. We have quite a few programs in the Air Force, in the Army, in the Navy. Very nice things can be said about all of these efforts. I should like to say that it is important to bring about a close cooperation, a close exchange, between these various efforts, as well as between the efforts going on in the competing industrial companies; in other words, the competition, which is in general a good thing, should not be carried to the point where we are keeping secrets from each other.

Now, I don't think this has been done, but one should do one's very best to foster exchange of information.

I should think that as far as the efforts within this country are concerned, these are the simple and general things that I can say.

Mr. WEISL. Have you any other views as to the strengthening of our alliances abroad in connection with this effort to defend our security?

Dr. TELLER. I have been this fall over in England and looked at their air-industry show, and I was most impressed by this show, by the excellence of the British effort, not in the rocket field, but in a field close to that of the rockets.

I think that it is most important that we cooperate with our very able friends, not only in Britain, but I would like to see this done across the board in the NATO countries, and maybe with other allies.

I think that the suggestion that has been made toward such a cooperation is a most excellent one, and that it is an absolutely necessary one.

I should recall that during the war the British, Canadians, and ourselves worked together in the Manhattan District on the development of atomic energy, and I think that we had very, very valuable help from our friends abroad, and the spirit of cooperation was most excellent.

I think that the present emergency is perhaps greater than the emergency was at that time, and it is greater for the simple reason that it is less apparent. We are more apt to forget about the fact that we are in a very dangerous situation because no actual shooting is going on.

I think that the situation is dangerous enough to justify, in fact, absolutely to require, the fullest cooperation with our allies in the general field of developing technical things in the scientific field and most particularly in the application of science and technology to the development of weapons.

I would like to see such a cooperation go on jointly and closely, and without barriers.

DANGER IN EXCHANGING INFORMATION

Mr. WEISL. Do you think there is any danger in exchanging information and cooperating with our NATO and other allies?

Dr. TELLER. I think there is. We cannot fully cooperate without sharing our secrets. I think that if we share our secrets, if the secrets

become known to more people, then the probability of a leak will necessarily increase. I think that this is a danger.

I think that this is, however, a danger which we must accept, because I think the danger of not cooperating, of falling behind, is, in my mind, much greater still.

Let me put it this way: Right at the end of the war, 1945, 1946, we had a monopoly in atomic weapons. Of course, we shared it with the British and Canadians, who were in on the development.

But among us, among this close group, we did have a monopoly.

At that time secrecy was, I think, really justified. The fact that some of our secrets leaked, a most regrettable fact, still made it very important to keep the rest of it, because in just a few reports, big technical development cannot be given away.

I would not say that the Russians caught up with us because they stole our secrets. They caught up with us because they worked harder, and that is the simple fact.

Now, the point is that we have lost this monopoly. We have no decisive lead in practically any of the fields. Therefore, the very value of our secrets is not as great as it used to be, because the Russians can find out for themselves due to their own efforts.

Under these conditions, secrecy is still important, but less important than it used to be; and speed of development, on the other hand, is more important than ever.

I would advocate the closest cooperation with our allies, even if that means that some of our secrets will be lost a little faster, because we will, on the other hand, by cooperating with our allies, produce new secrets faster.

Mr. WEISL. In other words, you believe that the allies have a great deal to contribute toward the quick development of our defenses against a potential attack by an enemy?

Dr. TELLER. I feel that they have a very great deal to contribute toward the mutual defense, toward the collective defense of the free world.

Mr. WEISL. I think you told me, Dr. Teller, for instance, that the French were ahead of us in electronic development.

Dr. TELLER. I don't think that I told you that. I think that this is so. But I do not have any firsthand information.

Mr. WEISL. At any rate, some of our allies are ahead of us in some of the critical areas needed for the quick development of our defensive arsenal?

Dr. TELLER. Let me perhaps make a general remark. Science is an extremely broad field. It has incredibly many branches, and it consists of a bewildering number of specialties and specialists.

I know that there are extremely good men abroad, and it would be a very great miracle if in quite a few of these many branches they would not be ahead of us, nor is that anything to be ashamed of.

Science and scientific development and application of science to technology and to military technology, is just a field where cooperation pays off, and pays off in a big way.

HOW WE SHOULD MEET PRESENT DANGER

Mr. WEISL. Dr. Teller, have you any other suggestions as to the way we can meet this present danger which faces us?

Dr. TELLER. I don't know whether this is the right time for me to say at least a few words about our defense in the strict sense of the word, and about our meeting the immediate emergency that is facing us.

Mr. WEISL. Yes, sir.

Dr. TELLER. Well, it seems to me that there are two very obvious ways in which we can defend ourselves.

One is this: We must be prepared to strike back if we are hit, and we must be prepared in such a way that our ability to strike back cannot itself be destroyed by a surprise attack.

This is a difficult thing to do. In my opinion, it is possible.

First of all, it is possible because we have some organizations which have functioned extremely well, and which are functioning well, and I mean in particular the Strategic Air Command.

I believe that by being on the alert, by continuing to look to our defenses, and by strengthening them, by making our bases harder to attack, by dispersing our retaliatory force in every way possible, we can continue to make it certain, and clearly certain, that we can return any attack to which we are subjected.

This is one very important phase of our immediate defense.

Another—

Mr. WEISL. That would apply to the Navy and the Army, as well, would it not?

Dr. TELLER. It will apply to every form of our Armed Forces that can really and effectively contribute to this joint defense.

POWER TO RETALIATE

Mr. WEISL. And we must let it be known to the Russians that we have this power to retaliate.

Dr. TELLER. Obviously we must let it be known to the Russians; and, furthermore, in this phase, too, we must cooperate, as we are cooperating, with our allies.

One thing that this requires, of course, is an early warning system, a radar system. We have done a lot. We should be doing more. We must spend money wherever money can help. We can be helped in turn, very greatly, by the observation of our allies, by the bases that our allies allow us to use.

In all these ways we can prepare our defenses, and of course we have to be prepared to strike back with missiles as soon as we possibly can do so; in other words, develop our intermediate-range missiles and long-range missiles at the fastest reasonable rate.

Now, I think that all of us know, and I am deeply convinced, that such a force will never be used by this country or by the free world to attack Russia. But we must have it in order to be able to strike back if they would like to start such an engagement.

I think that this is one phase of the defense.

There is, however, another phase which can be more properly called defense, the passive defense. Is it proper for me to talk about that for a few minutes?

Mr. WEISL. Yes, sir.

Dr. TELLER. Or should I stay with this other and answer any more questions that you may want to put to me on this particular phase?

PASSIVE OR CIVILIAN DEFENSE

Mr. WEISL. I think it is proper for you to discuss all practical opinions that you may have which will show us how to strengthen our defense against a possible attack.

Dr. TELLER. Well, I believe that we could do very much more than we are doing today about passive defense.

Mr. WEISL. About what?

Dr. TELLER. Passive defense.

Mr. WEISL. Passive defense?

SHELTERS AND RADIATION METERS

Dr. TELLER. Passive defense, which I will describe as essentially defense by shelters and similar means. Of course, active defense is important, and it is a complicated matter about which I don't have specialized information, so I don't think I should talk about it. But it is obvious that active defense has at least one disadvantage. It becomes obsolete rather rapidly because the other fellow makes a new invention about which you may or may not know, and your active defense might be in trouble.

The passive defense is a more general kind of a defense. It has not changed so very essentially even between the Second World War and the present situation, and I think it is of more permanent value.

First of all, I believe that we can do more and we should do more, very much more, about shelters. I think that if we go at the development of shelters at a reasonable rate, at a reasonable pace, if you do not require that shelters give absolute security but just do the best we can, and couple the construction of shelters with other useful projects wherever this is possible, we can gradually build up a shelter program.

Mr. WEISL. May I interrupt you, Doctor?

Just what do you mean by "passive defense"? Do you mean a survival defense in the event we are hit?

Dr. TELLER. I mean the kind of a defense where, in case we are hit, we should be able to save the lives, not of all of us, but of the great majority of us.

Even so, there is no doubt that in an all-out war, there will be a terrifying number of casualties, but we can so prepare that all of us will have a good chance of survival, and most of us will survive.

And, furthermore, I believe that this defense should have a further phase, namely, a phase in which we should be prepared to get back on our economic and national feet.

Mr. WEISL. May I interrupt one minute?

Dr. TELLER. Yes.

Mr. WEISL. You spoke of shelters. Shelters against what, Dr. Teller?

Dr. TELLER. Well, this is a difficult and complicated problem, to which, however, I have given a little thought. I have in mind, first of all, shelters against fallout. A shelter against fallout can be very easily and very cheaply constructed. In areas which are not closely built up but in areas to which the wind may carry radioactivity, such shelters could be put up at relatively small cost.

Connected with that, of course, we need a program which exists today but which I am sure is not vigorous enough, a program of

making available to people cheaply and in an appropriate form, radiation meters so that they should be able to find where are the dangerous spots.

Then, I mean something more and something more difficult. In the closely built-up regions, in our cities, there is a danger greater than the fallout, and also greater than the much advertised shock. Of course, immediately below a powerful bomb or in the immediate neighborhood of a bomb, you may find that there is not very much you can do unless you go to really terrific expenses.

BOMB DAMAGE

However, most of the damage of the bomb is not direct. Most of the damage, even in those cases where we have experience, is done by the fire storm, by the conflagration which follows such an explosion. Houses are knocked down, a great number of small fires are started, and in the updraft that results, all these coalesce into the kind of a fire which we have seen in the two cases at the end of the last war, and this fire storm is likely to claim more victims than anything else.

In the closely built-up areas, we have to face the difficult problem, and it won't be faced, it won't be solved within a year or 2, but it can be solved gradually—how to get a system of shelters which can withstand the fire storm where people can go and stay for the hours while this fire storm is raging, and be supplied with the necessities, including air.

Mr. WEISL. What else would you do besides building shelters against fallout and for survival against a fire hazard?

Dr. TELLER. Well, I believe that if we prepare in a reasonable way, we can feel certain that a great majority of our people will survive an attack.

At the same time, we can by no means guarantee that a great fraction of our industries will survive. In fact, it is quite likely that our industries will be knocked down. And this recognition, this fact, has given people a terrible feeling. Many are apt to throw up their hands and say, "What's the use in surviving? We won't have a country left in any case."

Now, I believe that this attitude is mistaken. I think that America is a rich country; I know it is a rich country, and I think that we can make arrangements so that we have a well hidden nest egg from which to rebuild industries if we ever are hit.

FOOD STORAGE AND SUPPLIES

Let me give you the most obvious example. We have great stores of food supplies which at present we consider a nuisance. In time of war, these food supplies, for the next 2 years, may be a lifesaver in the most literal sense of the word. A very simple and easy measure which I would advocate: to take this food supply and distribute it throughout the country in such a way that it should be safe from fallout, out of the range of the immediate probable targets, and disposed in such a way that in case of emergencies it should be readily available to people.

At the same time, we have to build up stocks, stockpiles of those commodities which have a key importance in rebuilding our industry.

This may mean some transportation equipment, trucks; this may mean some raw materials; this may mean machine tools; it may mean a lot of things.

All this will not come easily, and has to be done carefully and in a considered way so that it should not become too expensive.

To the best of my knowledge, we have not even studied thoroughly the question how much such a program will cost, and I cannot tell you how much it will cost. But I feel convinced that this is a program which a rich country like the United States can undertake.

A country where the masses are starving, as Russia, I think will be in a very difficult position to match us along this purely defensive line, and we might be able within a few years to put ourselves into a position where the Russians can hit us badly but not so badly that we cannot recover, and at the same time we shall be able to retaliate in such a way that they won't be able to recover.

Under those conditions, I think we can begin to feel sure that as long as we keep up these defenses, the all-out danger will not occur. We can avert war by real preparedness, including this defensive preparedness.

Mr. WEISL. Is that about all that you can think of to tell the committee about our short-range program or our immediate problem?

Dr. TELLER. Well, I would think, yes, and perhaps I have outstepped our classification, because some of these things I have talked about are obviously longer range. Some are certainly short-range, because some of these things could not only be started but executed within a year or two.

Mr. WEISL. Now, if you will kindly, Dr. Teller, turn your attention to the long-range program. May I state—

Dr. TELLER. May I please interrupt for a moment and presume on your kindness to ask for a 5-minute interruption? I am really quite tired, and I would be happy if I could continue in approximately 5 minutes.

Senator JOHNSON. The committee will take a recess.
(Short recess.)

Senator JOHNSON. Will the committee please come to order.

Dr. Teller, are you ready to resume with your testimony?

Dr. TELLER. I am, sir.

Senator JOHNSON. Will you proceed, Counsel?

Mr. WEISL. Dr. Teller, when the chairman briefly read your biography, he omitted to mention, which I would like to mention, that you are a member of the General Advisory Committee of the Atomic Energy Commission; is that not correct?

Dr. TELLER. That is correct, yes, sir.

Mr. WEISL. By whom were you appointed to that Committee?

Dr. TELLER. By President Eisenhower.

LONG-RANGE DEFENSE PROBLEMS

Mr. WEISL. Are you ready, Dr. Teller, to go into what we call the long-range problem that we must seriously consider in order to prepare for the defense of the United States?

Dr. TELLER. I am ready.

COMPARISON BETWEEN UNITED STATES AND SOVIET SCIENTIFIC AND TECHNOLOGICAL STATUS

Mr. WEISL. Would you be good enough, in your own way, to compare the scientific and technological status of the Soviet Union with the scientific and technological status of the United States?

Dr. TELLER. I will have to concentrate mostly on the scientific end, because that is the one about which I have much more knowledge.

Mr. WEISL. I might add, at the beginning you felt, at least I had gathered from my interview with you that you felt, that the United States faced two great dangers, both almost equally important.

One was the immediate danger of a possible attack by Russia, which we hope will never take place, and the other was that of a technological and scientific attack. In other words, if Russia beat us scientifically and technologically, we might become a second-rate nation rather than a leading nation of the world.

Dr. TELLER. I am afraid that that is precisely true.

Mr. WEISL. Will you please continue?

Dr. TELLER. I will attempt to do so.

I think the main danger I have already mentioned. The Russians are catching up with us and have surpassed us in certain fields. Their rate of advance is considerably faster than the rate of our advance.

I think that this is perhaps more clear in science than in any other field. They have stressed science very greatly, and they have built up their scientific manpower in a most admirable, most remarkable manner.

Now, I would just like to say at the outset that we have plenty of evidence that the Russians are doing this, and that they are doing it on an extremely broad front, including the applied sciences, including basic sciences. There is just no stinting of means, and they are going ahead as fast as they possibly can.

I think it is almost unnecessary to say what I am going to say right now. In the past years, it has been asserted, "Well, the Russians have taken a few German scientists over, and the German scientists are doing it."

I never believed that, and I doubt that there is anybody left who believes it.

It is quite clear that the Russians, while they tried to get all the help they possibly could get, have done the main job themselves. I do not know, would it be a good idea, perhaps, if I just tried to explain why and how the Russians could do this? Because they have done something that is, as far as I know, without precedent.

I think that in a way the explanation is quite simple and straightforward. The philosophy that the Russians profess puts a very great weight on scientific and technical accomplishments.

If they do not go ahead in those fields, then they have condemned themselves according to their own ground rules. Also to build up a scientific capability must come first. Technology is the second step, and also necessarily the slower step because more material means are involved.

This has led in Russia to the situation where I think the scientist is in a quite unique position.

Most people in Russia starve. If you do not want to starve in Russia, then there are two ways to get an agreeable life. One is to

get a lot of responsibility, for instance, become a more or less prominent member of their one party.

The other is to become a scientist. If you get a lot of responsibility, then as far as I understand, you also lead a comfortable life, but by no means a secure one.

If, on the other hand, you become a scientist, you have as good a life and as secure a life as you possibly can have in Russia. Now that is only part of the story. It is not only true that you are comfortable. It is also true that the Russian scientist is very greatly honored. Scientific books in Russia have a sale which outstrips the sale of scientific books in the rest of the world by something like a factor of 10. It is an amazing phenomenon. Their scientists are honored, and to some extent even understood, by the general public.

Even those in Russia who are not scientists themselves are trying their hardest to understand something about scientists. Quite a few of our scientists have recently visited Russia. I myself did not. The stories which we hear from them—and I talked with a great number of them—are quite uniform.

Generally they were welcomed and they could talk with the man in the street. Generally they found very little if any hostility. But when they mentioned that they were scientists, that brought smiles and a real welcome out in every case.

The word "scientist" just has a connotation in Russia which is not present in our country.

A Russian boy thinks about becoming a scientist like our young girls dream about becoming a movie star. It is just the best thing you can do; the best, the most active minds are attracted to this field, and they are given both the means to live decently and all the honors they can dream of.

Now, under these conditions, of course, and with practically no limit on expenditure, it is not a surprise that Russia has gone ahead.

Let me perhaps give you now two further examples.

The Russians have gone ahead quite vigorously in a field which is, I think, known at least by name to most people, high-energy physics.

Senator SYMINGTON. Excuse me, I did not hear that.

Dr. TELLER. High-energy physics.

You take one of the smallest particles, the nucleus of the hydrogen atom, a proton, and accelerate it to a velocity very nearly that of light and concentrate in that particle a very great deal of energy.

Now you ask me why we are doing it, and when I tell you that this is one of the most expensive, perhaps the most expensive branch of university sciences, you will ask me the more "Why do you spend this much money?"—quite a few million dollars. My main answer will be—I will try to tell you in more detail if you want to hear, but my main answer is—I do not really know.

We have plenty of reason which I can explain. There are plenty of reasons to assume, in fact we have seen this, that when such a very fast particle hits another particle, a whole number of new and strange kinds of things are generated.

They have funny names like "mesons" and "hyperons," and I don't need to talk about it although I could and I would like to.

They are funny. In the long run we are probably going to discover something about them and we will gain control in a new field of the world, but where we are going we have really no idea.

The practical possibilities are no more clear to us than was the possibility of discovering America when Columbus started westward. The main point is that we do not know where we are going when we are doing the most interesting things, but there are a number of indications that we are going to find something.

Now, in this field which is as yet impractical, the Russians have been way behind us, but now in the last year they have completed a machine which is better than the best machine so far in existence.

The best machine which is now the second-best machine I am still moderately proud to say is located in Berkeley in the radiation laboratory, but the best machine today is in Moscow.

To do that they have to use a great deal of steel. Quite a bit of the expenditures goes into steel. The Russian steel production, I don't know what it is—is it about 35 percent of ours, is it 40 percent of ours, something of that kind?

They put into that machine something like five times as much steel as we put into ours. As soon as it comes to explore these new regions, there is no limit to what they will be doing. They have been advertising quite generally that they are prepared to go to the moon. Why?

It you want to we might get back to that question. When you get there almost certainly, not almost certainly, with absolute certainty, you will learn a great number of things.

These things at first will seem impractical. Their practical consequences will occur later. The Russians have shown in many examples that they are quite willing to support this impractical science, which is the breeding ground of the practical science which in turn is the foundation for the real technological advances.

They took a broad program and they were not saving any effort, and that is the way they have beaten us.

May I just stop at that point or shall I go into our own side of the picture. I would be very, very happy to elaborate on any part of this if I am asked to do so.

MR. WEISL. Will you elaborate on it as much as you want and as simply as you can so that we simple minds can, if possible, understand it?

GOING TO THE MOON

DR. TELLER. Shall I tell you why I want to go to the moon?

MR. WEISL. Yes, sir. [Laughter.]

DR. TELLER. Well, I have already told you in a way. I don't really know. I am just curious.

MR. WEISL. But seriously speaking, you believe that people will go to the moon, do you not?

DR. TELLER. I am certain that people will go to the moon and will get to the planets. There is no question about that in my mind.

Now when we get to, let us say, the moon or to Mars, I can tell you one or two things. You probably have thought of it yourself. We would want to do it, for a purely scientific reason and with no practical implications, for the time being.

For one thing, I would be extremely anxious to put up an observatory on the moon. We are looking out of our atmosphere in just a few wavelengths: first of all in the visible region and since the war in the region of some radar frequencies.

This region of radar frequencies has incidentally taught us a great deal about the universe, has led us to recognize, for instance, that whole galaxies consisting of billions of stars sometimes collide, and this collision of galaxies is beginning to be studied due to their discovery by radioastronomy.

Now, when we go to the moon, a possibility of looking at the universe will not be just in a few wavelengths in the visible and a few in the radar region. It will be over the whole spectrum. This is an increase in information very much greater and the increase in fullness of the picture very much greater than when you go from black and white to colored pictures.

I would like to look. I want to go to the moon because I can use it as a platform to look even farther. Even though I know that the moon is a very inhospitable sort of place, I will look for any kinds of traces of life. They may show up in some strange and unexplainable chemical combination.

I will certainly look for something like that when we get to Mars. It is quite possible that when we get there first we won't even recognize life because it will be so strange that it will look like no life.

Nevertheless, by and by we might learn things, and by that we might learn something about ourselves, which is certainly extremely interesting. So I would like to say that in the field of the exploration of the moon and of the exploration of the planets there are a great number of most interesting and most inspiring things, and practical things will come a little bit later.

I don't know, would that suffice, and shall I go over to the American side of the picture?

Mr. WEISL. You are certain that the Russians are going to make these explorations and are working exceedingly fast in that direction, are you not?

Dr. TELLER. They have all the technical foundations to do it. They have advertised that they will do it to their own people. Therefore it does not sound like boasting. They said to their own people, they have made films of it and shown to their own people how they will do it.

Now, if they don't do it, then of course they lose face internally.

Why should they do all these things if they would not be planning it? And furthermore, it is in my opinion the reasonable and right thing to do.

MILITARY ADVANTAGE

Mr. WEISL. In your opinion will the success of this mission to the planets and the moon have any military advantage and significance?

Dr. TELLER. I am sure that it will have a great practical advantage, and I am sure a great peaceful practical advantage, and I am sure it will have also a great military advantage.

But don't ask me please what it is. My imagination is not good enough for that.

If you had asked me about ballistic missiles in 1945 or 1946, I would have said, "Let's do it and let's do it fast," and then you would have said: "In what particular way will you apply this in a possible war," and I would have told you, "I don't know, but once we make it we will find some use."

And I think going to the moon is in the same category.

I cannot tell you in black and white what will be the advantages. I could dream up some sort of systems which need the moon, and then I can dream up counterarguments and I can argue for as long as you please.

But the fact is that if you make such a very big step like going to the moon, it will have both amusing and amazing and practical and military consequences.

That is how it always was in the world.

INCENTIVE FOR SCIENTISTS—FREEDOM OF RESEARCH

Mr. WEISL. Dr. Teller, you have told us that in Russia the scientist, or the potential scientist, is given every incentive to become a scientist, to study science. He is given high salaries, high honors, and great respect. Now will you tell us how that compares with the treatment of science, scientists, and education looking toward the making of a scientist in this country.

Dr. TELLER. I am anxious to do so. Our country is a democracy and we are all most anxious to keep it a democracy and to make it a more perfect democracy, and I think that it comes closer to the democratic idea than any country in the world, and this means—and it is a good thing—that practically everything we are doing we are doing for the common man.

The differences between people are small. If something is not enjoyed by the common man, by the man in the street, it is usually considered very considerably less important, and in general I consider this as a fine thing.

It is as it should be. But then you come to a field like science, a field for which I am sure most people, perhaps even all people, could develop a taste. But a taste for science is an acquired taste, and most of our people have not acquired that taste.

There is a word, a single word in the American dictionary which is most expressive and summarizes the situation—the word “highbrow.”

Mr. WEISL. The word “highbrow”?

Dr. TELLER. Highbrow, yes. It means that the American people consider the scientist as a person apart. It is all right if he plays his little games, and sometimes these games become practically important and by that time the people are really interested.

But the scientist himself has no real, close connection to the understanding of the people.

Now, I think that this is a dreadful mistake. Good drama can develop only in a country where there is a good audience.

In a democracy particularly if the real sovereign, the people, expresses lack of interest in a subject, then that subject cannot flourish. You can tell your child that it is a good thing to study mathematics or physics or chemistry. If you yourself have not interest and no understanding for these subjects, none at all, then a child is very fast in discovering that you are preaching something which you yourself do not follow, and he will treat your advice accordingly.

The spirit in our schools is such that a kid who is interested in science is ridiculed by his fellow students, and he will very rapidly lose that interest.

Now I would like to make a statement of my conviction of a very broad, almost philosophical field, and I know there are many who won't agree with me but I believe it.

You might ask me what is talent, what is genius, and I think I know, and it is a very simple thing.

Talent and genius is nothing else but specialized interest.

Now such interest very frequently arises spontaneously. Sometimes it has to be stimulated. But even if it arises spontaneously, unless it gets some stimulation, some response in its surroundings, it will die.

I have often heard statements, "We have enough talented children, we only need some money so that they should get more education." Money is actually needed.

But first of all, such a thing as a talented child, a talented child in the field of science, I don't know what that is. The talent is not something which is or is not. The talent is something which develops and is developed by the response of the surrounding, and this response is not good enough in our country.

Now one often hears the statement: To single out a group of young people who happen to be interested let us say in mathematics, and give them special treatment is undemocratic.

I would like to ask the question:

Is it undemocratic to give special treatment and also special admiration to football players?

Those we certainly give all the stimulation possible. We do not take them out of our schools. They remain in touch with the others, but at the same time we give them every incentive, first of all psychological incentives to go ahead in this field, which can be enjoyed by so many people.

Our scientists need not be admired more than our football players. I mean the young ones, I mean the 10-year old scientists and the 15-year-old scientists. But they should get, I would like to say, perhaps with some lack of modesty, as much admiration as a football player.

I think this is the first condition. But to put it into effect is another thing and is a complicated and difficult thing.

I should like to start with the schools, and I should like to read to you a very short statement from a very respected person in a high position who is, you will agree with me later, not given to overstating Russian accomplishments.

He says:

This is the cold war of the classrooms. In 5 years our lead in the training of scientists and engineers may be wiped out, and in 10 years we could be hopelessly outstripped unless immediate steps are taken to correct it. A situation already dangerous within less than a decade could become disastrous.

Now unfortunately this statement was not made yesterday. It was made a little more than 2 years ago, and it was made by the Chairman of the Atomic Energy Commission.

I feel that it is most necessary that we change the situation in the schools, I mean the high schools and I mean also the elementary schools, because by the time a kid is 12 years old he probably has adopted the mental attitudes which will make him a good scientist or else which will definitely get him interested in some field other than science.

The first obvious thing that is necessary, is that we have to pay more, much more to the science teacher.

Science is in short supply in this country. Any good scientist can get at least twice the salary but probably 3 times or 4 times the salary in an agreeable job in industry or elsewhere than he can make as a teacher in high school.

Our best science teachers are taken out of the high school. Our high schools and even more, our elementary schools are left completely bare of people who know something about science.

How shall a child become interested in science when, in all his life, in all his young life, he does not get in touch with a person who himself is interested in science?

Now, I am not a specialist in teaching either in the sense of the word in which it is used in the elementary schools or in the high schools.

I am only a university professor. But I feel that one of the most important elements in teaching is imitation. If you go into a class with a bunch of children, and if you make clear to them just one simple thing, that a subject exists and that you are passionately interested in it, they will want to do the same thing.

They will get interested, too. We are descended from monkeys, and imitation is one of our most strong impulses.

But if there is no one to imitate, then what do you expect?

I think it is very necessary that we pay our science teachers in elementary schools and high schools more. We must find those kids who show any interest, who will grab hold of a problem and not let go.

That is the real sign of the interest, not to be quick but just to be thoroughly interested. These children should make contacts with other scientifically interested people so that their own interest should be stimulated.

I believe that it might be worth while to work out some system by which university scientists, pure researchers, scientists from the industries should be giving some fraction of their time, oh, maybe 20 hours each year, whatever you will, to talk to children in the elementary schools and in the high schools, to make them acquainted in the simplest possible terms with their own field, and give them a picture of what science is about.

Let me try to put the same thing in a slightly different way. We talk a lot about general education, and general education is an important thing.

Yet when it comes to a question like an atomic nucleus, and I try to talk to people about atomic nuclei, I just see them shudder and I see their ears close almost as though it were a physical act. This is obviously something too difficult, it is the black art, we are not interested in it.

We have to correct this situation because we are living in a scientific and in an industrial age, and a person who is not acquainted with the basis of our material civilization is not completely educated.

I am therefore advocating that the talented ones among our kids should be given plenty of opportunity to go ahead and develop their talents, and the mass of our children should be given something which may not be terribly strenuous but should be interesting, stimulating, and amusing. They should be given science appreciation courses just as they are given sometimes music appreciation courses.

We do not necessarily want to make a musician of everyone. In fact we definitely don't. It would be a terrible world. But a rather general enjoyment of music contributes to the fullness of life. A

general appreciation of science would similarly contribute to the fullness of life and, more than that, will contribute to our safety.

Now, I would like to approach this same problem in still another way. There are in every society a number of people who are charged with the terrible responsibility of making decisions. This decision must be based on knowledge.

Now to my mind it is obvious that a person who is narrowly specialized in order to do the difficult things that he is doing, a scientist, is as a general rule not the right person to make decisions because he does not usually have a sufficiently broad view of the world.

I don't want to make any absolute statements, but as a rule I want to make this statement. So the people who have to make the decisions in order to get the basic facts which they need, will have to go to the scientists and ask them for special advice.

Now, this advice that you will get from us scientists is like all advice; it will be, sometimes, good advice and it will be, sometimes, bad advice, and it is your agreeable job to distinguish between good advice and bad advice.

One thing you can do is that you take the reputable ones, and that is good advice, and the less reputable ones, and that is bad advice.

But, unfortunately, the world is not as simple as that. Life is complicated, and the best of us, for a number of reasons, will make mistakes.

For all I know, the advice I am giving you right now might be bad. You will have to decide.

Now, therefore, the person who makes the decisions and, ultimately, even the real sovereign, the man in the street, he cannot be a scientist but he must develop an ear for science so that he can distinguish good advice from bad advice, good science from crazy fiction.

This, I am sure, can be done, but it needs a lot of doing. It needs a change in the attitude of 165 million people. The main thing I am trying to say is that this education process, while necessarily slow, is, in the end, really necessary, and at the same time it need not be, and, in fact, it must not be, a painful process.

We simply have to spend more effort to say to the public, in simple and straightforward terms, what all the science is about.

The highbrows, because they have been called highbrows, have gone off into a corner and started to talk to each other in terms of polysyllables which have become so complicated that, in many instances, they do not even understand each other. [Laughter.]

We have to cultivate the simplicity of expression. We have to do everything in our power to make it clear what is really new in physics, in biology, in the various sciences.

You have heard about relativity, and you have heard about quantum mechanics, and you say this is something only for geniuses. Nobody else can understand it. May I please say this is complete nonsense. Five hundred years ago it was only for geniuses to know that the earth is round.

Today every child knows that the earth is round. We have found simple methods, visually and with words, to explain to them what all this means, and the more clever ones among us can even figure out what happens when we cross the dateline.

However, of the new surprising scientific discoveries we shy away. We close our ears. Even scientific discoveries which have been made 25 years ago and 50 years ago, they still have not penetrated to the public because the public is too afraid of them.

I think that there is a lot to be done about closing the gap between the specialists and the common man, and only when that gap is closed is it possible for our people, for our scientific people, to have the feeling that they are playing to an audience.

If they are not playing to an audience, they surely won't play as well.

In Russia, the scientist is driven forward by the whip of hunger, by the fear of misery, and by the reward of honor.

We are living in a world which is successful in eliminating, progressively, misery. We cannot and we should not drive our scientists ahead with any sort of a whip, and we have, by leveling our society, by making the standard of living so even throughout the country, effectively abandoned this particular kind of a whip.

I also don't want to say that any group of people, and the scientists in particular, should be put on a pedestal as they are put on a pedestal in Russia. That, to my mind, is distasteful. But I would like to say that people should be interested in scientists, in science, not only in the results produced but also in the ways, how it is produced.

Our sports fans do not merely look at the score of a football game, but they look at the game play by play, and they know who made what mistakes and who was brilliant in what manner, in what way.

Now, if a similar general understanding should spring up, I am sure that we can outproduce the Russians in the scientific field as well as in every other field, because we can add to the fact that we will have many and good scientists the fact that the scientists' imagination and work will be much more untrammelled, much less directed. This or that inconspicuous scientist will come up with something that does not look particularly important and then, suddenly, it becomes extremely important.

Freedom of research is much more important, freedom of action is much more important in science than anywhere else. But it must be accompanied with genuine public interest.

Now, I think that is essentially what I wanted to say, with possibly one exception, and I do not know whether I should further take the time of this committee.

I wonder, Mr. Weisl, whether I might ask you: Would it be proper for me to go on and talk about my fears, of which you know, that we might get left behind Russia and really find ourselves in a completely indefensible position, even without active war?

Mr. WEISL. I think that anything that concerns the defense of this country, either by military weapons or by scientists or any other means, is of great interest to the Senate committee.

Dr. TELLER. I have in mind—let me be quite brief, and elaborate on it only if you ask me to elaborate on it—I have in mind developments which do not seem to be concerned directly with defense, but which are, nevertheless, of very vital interest.

Mr. WEISL. Perhaps you could give us 1 or 2 illustrations of how pure science has led to the development of defense against attack, or the preparation for a defense against attack?

Dr. TELLER. Well, I am sorry; I do not know what particular phase to mention. The most obvious thing is——

Mr. WEISL. Certainly, the intercontinental ballistic missile was developed from research in pure science?

Dr. TELLER. That, certainly, is true. I would perhaps quote, with even more direct knowledge and, perhaps, even more aptly, nuclear

science. The leading man in nuclear science in the first decades of the century was Lord Rutherford in England, and I heard him say, publicly and with full conviction, that the atomic nucleus cannot be put to any practical use.

He said that in my hearing—I am not quite sure whether it was in 1934 or 1935—at a scientific congress.

He said there are some visionaries who think that nuclear energy could be used for a practical purpose, and he went on record, saying, "This is impossible."

You know what has happened. You know that in our military preparedness just a few years later the opinion of the greatest expert and the pioneer was proved to be, to say the least, conservative.

Is that the kind of thing you would want?

CONTROL OF WEATHER

Mr. WEISL. Yes, sir; for instance, the control of weather.

Dr. TELLER. Well, this is a question about which I am very anxious to talk, and it is connected with——

Mr. WEISL. I mean as it is connected with the defense of the country.

Dr. TELLER. It is connected with defense by all means.

Let me say the prediction and control of weather. Certainly it has been recognized for a long time that weather prediction is most important for military operations, and I know that, for instance, our Air Force is very actively engaged in this field.

There are a number of extremely interesting developments. We are collecting data on the weather more widely than it has been collected before, because we are collecting data from all altitudes and we feed these into elaborate computing equipment, and we begin to make, with some little confidence, predictions about the weather 5 days ahead.

Nevertheless even though we recognize the importance of these things, we have cut out, in order to save a few million dollars, a few years ago we cut out the observation ships from the Atlantic so that we observe weather over big areas of the world only by occasional traffic.

I think that this was a great pity and the ships should be put right back in order to be better oriented in predicting the weather when we need it.

Furthermore, the weather prediction will have its limits because ultimately we find again and again that small causes in the weather can lead to very big effects, and when that is the case, prediction becomes very hard.

But if we find out precisely where the small causes lie which may trigger off the bigger effects, if we find out that, we will be on the road of controlling weather on a big scale.

I do not say that this can be done or will be done.

I say that it is quite possible that it will be done within the next decade or two.

Please imagine a world in which the Russians can control weather in a big scale, where they can change the rainfall over Russia, and that—and here I am talking about a fairly definite situation—that might very well influence the rainfall in our country in an adverse manner.

If we protest they will say, "We don't care. We are sorry if we hurt you. We are merely trying to do what we need to do in order to let our own people live."

What kind of a world will it be where they have this new kind of control and we do not?

I think, if you think about this and other examples, it will become very vivid in your mind what it might mean to become a second-class power.

Senator JOHNSON. I might observe the way the weather has been acting down in my country some people suspect the Russians already control it. [Laughter.]

Dr. TELLER. I must say that if we learn how to control weather, this will have one very bad consequence because it will eliminate the last safe topic of conversation.

Sir, I think that my mind is more or less blank by now.

DEVELOP HIGH-GRADE SPECIALISTS IN THE MILITARY

Mr. WEISL. Dr. Teller, I have unfortunately had the disadvantage of having talked to you only a short while before you testified, so that if there is anything that I have not asked that is material to this hearing that you would like to discuss, I wish you would do so.

Dr. TELLER. There is one thing that I know I did not mention, and I feel unhappy about it and I would like to return to it out of context.

It is a strictly military matter, and I feel that though it has been said often, it should be said again.

When we talk about our preparedness to absorb an attack, to retaliate, when we generalize this into many other situations which might arise, I am more and more impressed by the fact that the task of the military, of all branches of the military, the Army, the Navy, and the Air Force, is becoming, with every passing year, a more highly technical task, requiring a very elaborate technical education.

It is absolutely necessary that we should develop a professional armed service containing people who are high-grade specialists in their field.

I know this has been stressed by many of the military, and even though I am not as close to it as they are, I have had the privilege to look at the situation in many different connections, and I should like to say that a man trained for only the period of 1 year is usable in only a few and rather specially circumscribed situations, and the main strength of our defense will have to rest with the professionals.

Mr. WEISL. That is all I have to ask, Mr. Chairman.

Senator JOHNSON. Thank you, counsel.

Thank you, Dr. Teller.

FIVE PRIORITY ITEMS TO BE DONE

Senator JOHNSON. Dr. Teller, I have 2 or 3 questions that I would like to ask you. I will try to be as brief as I can.

You have earnestly and convincingly described to the committee the seriousness of the dangers, both short- and long-range, that face this Nation.

I wonder if you would summarize very briefly for us, or perhaps give us a schedule of priorities that you would set up to meet these most urgent problems.

Dr. TELLER. You are asking me a very difficult question, and I don't think I am able to answer it. I will make a feeble attempt.

Senator JOHNSON. I want to make that question as simple as I can. We have heard for 7 weeks now a lot of generalities about the satellite. And we have heard, in addition to that, for many years the possibilities that were just ahead for missiles; but I think the thing the American people want to know is what can we do now?

Dr. TELLER. Yes, sir.

Senator JOHNSON. Therefore as a distinguished scientist who has made a great contribution to our country, and has made, in my opinion, another great one this morning, I should like for you to tell us what you would do now, 1, 2, 3.

Dr. TELLER. There are a great number of things that we can do now. I think that the things that I can think of I would hate to put into an order of priorities because they are possibly in different and non-conflicting fields.

One thing I would do is to look carefully into the question of our SAC defense.

Another thing I would do is to——

Senator JOHNSON. Will you repeat that now—SAC defense?

Dr. TELLER. Defenses—SAC preparedness to strike back in case we are attacked.

No. 2, I would look carefully into the question in what reasonable way can our missile program be accelerated and expanded, and I would like to distinguish between acceleration and expansion. Acceleration means that we try to get the weapons which are now planned ahead of schedule. It is not enough to be on schedule, and I think that if we really go after it we could be ahead of schedule.

Senator JOHNSON. In your opinion can it be accelerated?

In your opinion can it be expanded?

Dr. TELLER. In my opinion it can be both accelerated and expanded, and I say that without special knowledge, but I say it because I have talked to many people who have specialized knowledge, who have the ardent desire to contribute, and who are not contributing today.

I furthermore think that cooperation with our allies will help to accelerate and expand the program, perhaps a little bit more to expand it.

Now by "expansion" I mean work on all kinds of things which will lead to a more rapid development of the next generation of weapons and a more rapid progress into what now is very generally described by the one syllable "space."

I am quite sure that there are a number of deserving projects to be performed not just as a stunt, but to be performed in order to get more knowledge, to find out what is up in the high atmosphere, what we see in the high atmosphere when we look back on the earth, exploration of this kind has not been thoroughly encouraged.

There was the Vanguard project, a most excellent project, but it was an isolated point where we should have been progressing along a broad front.

So this is one thing that we have to do.

Another thing that we have to do right now is to look to our passive defenses, shelter program, the more general distribution of radiation meters, at least an investigation into the question what need be done in order to put this country into a situation to reconstruct itself if it should happen to be hit very hard.

These things could begin right now and should.

I am quite sure that there are many other things.

I feel it has not been mentioned here that we possess a very powerful weapon which we are not developing as fast as we could, and I would hope that we are developing it, that we shall be developing it faster, and that is the nuclear-powered submarine.

I think it is an extremely important field in which we could accelerate our program with more money and also with more research.

And finally I feel that it is most urgent that we make an immediate start with the real long-range programs to look to it that we have a better science education in our elementary schools and in our high schools, and look to it that we do much more than what we are doing now about popularizing science, about developing the atmosphere in which the scientist can make and will make his full and proper contribution.

I may have, quite wrongly, omitted something from the list, and if this should be pointed out by anybody I will gladly acknowledge it.

Senator JOHNSON. So summarizing it, you would look very carefully into the question of increasing the strength or improving it where needed, of our SAC defense.

You would try to accelerate and expand the missile program. You would study and probably initiate an adequate passive defense program.

You would attempt to accelerate the production in number of nuclear-powered submarines.

You would make an immediate start to have better science education throughout our entire educational system?

Dr. TELLER. Yes, sir.

Senator JOHNSON. And those would be the five high priority items?

Dr. TELLER. They are very high priority items, and I do not think they conflict, and I don't think they will conflict.

Senator JOHNSON. Now which is the greatest threat, the short or the long range, in your judgment?

Dr. TELLER. I don't know.

SPEEDUP OF BALLISTIC MISSILE PROGRAM IMPERATIVE

Senator JOHNSON. What basic things must be done to speed up our intermediate and long-range ballistic missile program, in your opinion?

Dr. TELLER. Well, the immediate thing I think is to operate through the agencies which are now active, and explore carefully in what way, by means of overtime, by means of overtime work, by means of drawing into the effort additional competence one can make more rapid progress.

This will need very careful and detailed investigation, and I think is a huge job.

I think that in the long run, a somewhat longer run, one should give very careful thought both to the cooperation with our allies and

of organizational questions trying perhaps better to tie together our numerous excellent efforts.

But I feel that any such reorganization must proceed very carefully so as not to disturb the good programs which we have going at present.

Senator JOHNSON. Do you think that the missile situation requires substantial overtime work and that even multiple shifts might be indicated?

Dr. TELLER. I would be happy to see it if the companies and technical people involved should say that it is feasible. My guess is that it is feasible, but I cannot positively assert it.

Senator JOHNSON. And do you think it is wholly desirable?

Dr. TELLER. I think that it is something that is vital, if it can be done.

Senator JOHNSON. Dr. Teller, is what you say about the importance of increasing American strength and science and technology merely a matter of desirability, or do you consider it absolutely imperative to the survival of this Nation?

Dr. TELLER. The latter.

Senator JOHNSON. Senator Saltonstall.

Senator SALTONSTALL. Thank you, Mr. Chairman.

Dr. Teller, may I first say that this is one of the most interesting two hours and a quarter that I have spent since I have been in the United States Senate.

Dr. TELLER. Thank you.

STRONGER AUTHORITY REGARDING DUPLICATION OF EFFORT

Senator SALTONSTALL. I think you make an excellent witness and a witness that we can understand. Now, may I ask you just 1 or 2 questions to supplement what Senator Johnson said.

You spoke of the weapons being developed and the acceleration of the program. Are our efforts too scattered, in your opinion? Should we decide which are the most essential of our weapons and concentrate on those?

It seems to me that one criticism perhaps is that we are scattering our efforts too much.

Dr. TELLER. I feel that I am not really well qualified to answer this question. I have the general impression that most of the efforts that go on are thoroughly worthwhile. I even would guess that all of them are worthwhile, and I would hesitate to shut down any one and try to transfer personnel from one to the other. This might result in more disorder than speed. I think that some more thought should be given, and I am sure is being given, to the question how better to coordinate the effort, how to eliminate duplication so that if you have two similar objects, two groups working upon similar objects, these two objects should, from now on, if possible, diverge in their applications so that we should cover a broader field.

Rocketry does not mean just one aim. One has the intermediate missile, one has the long-range missile, one has the problem of the satellite with its own military applications, one has space exploration, one has among the missiles, missiles of all kinds using all kinds of fuel, and some fuels have the advantage of being more powerful. Other fuels have the advantage of being more readily available if an on the minute availability is required. We are talking about a very rich

field, and I think all the various projects which are going on now could be used in this rich field, if enough imagination is applied; and I would not like to throttle down any progress, but I would like to see that where there is a too great parallelism in endeavor, that one should try to differentiate a little bit more and try to find how best to use the force we have.

Senator SALTONSTALL. In other words, you do not believe that the competition on these various missiles up to the present time has been wasteful, shall we say, and nonproductive, but what you do believe now is that possibly there should be one, perhaps a stronger, authority over the whole situation that can determine how best to coordinate the efforts?

Dr. TELLER. I am sure that this should be done and is being done. I have the feeling that such an authority must find its way carefully into the present situation, but gradually should take a very strong hand indeed. I furthermore have the feeling that such an authority is most useful if it is acting not merely in an administrative manner, but if it is connected, closely connected, with a technical enterprise, maybe a Government contracting laboratory, which can, in this way, give a much more solid basis of the judgment of the comparisons between the various kinds of efforts.

I certainly would not like to use the word "wasteful" in describing what has happened in the past. But I am sure that the effort, like all good efforts, can be improved, that it must be improved. And I would like to repeat what I have said before. Our efforts in rocketry have been excellent and improving. The only trouble with it is that the Russian efforts are better.

COOPERATION WITH OUR ALLIES

Senator SALTONSTALL. May I change the subject just a little. I have just been in Brussels, Belgium, and I had a very interesting talk with a general there who is placing scientific contracts for research in France, Belgium, and other countries in Europe, a General Gossett.

You talked about more cooperation with our allies. This program that we have now abroad is a comparatively small program, but it has 181 contracts, I think, now out, and some scientific scholarships.

Do you believe that that is the type of thing that we should accelerate and encourage and enlarge?

Dr. TELLER. This is the kind of seed that will return a hundredfold.

Senator SALTONSTALL. Will you repeat that, please?

Dr. TELLER. This is the kind of seed that will return a hundredfold. There is no cheaper and no better way to spend money.

Senator SALTONSTALL. In other words, you believe that with respect to this cooperation with our NATO countries, we should put more money and more effort into that program?

Dr. TELLER. Most certainly.

PASSIVE, OR CIVILIAN DEFENSE

Senator SALTONSTALL. Now, may I ask you one more question. You spoke of passive defense. Passive defense, as I understand you, is what we have generally in political circles called civilian defense, am I correct?

Dr. TELLER. Correct.

Senator SALTONSTALL. You mentioned two programs which are new to me. You mentioned the program of setting up devices as I understood you, to determine the amount of radioactivity.

Dr. TELLER. Radiation meters, Geiger counters.

Senator SALTONSTALL. Yes, radiation meters.

Dr. TELLER. That is right.

Senator SALTONSTALL. Is there such a meter that is practical that can be put around on a broad scale that people can use?

Dr. TELLER. It is completely practical. It is the same kind of thing that is used, for instance, in uranium prospecting, you see. To learn how to handle such a meter is a matter of 5 minutes. I mean there is no problem about that. There is a problem about mass producing and distributing these meters.

Senator SALTONSTALL. So that our activities there should be on a mass production of something that is already now known?

Dr. TELLER. Precisely. We must get this mass production as effectively and as cheaply as we can. I think the development should be in the direction of making, adapting these instruments to the use of the layman and also getting it so that having millions of these available would not be a serious strain.

Senator SALTONSTALL. Finally, do I understand you to say that you believe that we should concentrate our efforts more on saving people from the dangers of fire than from the dangers of explosives, because the explosives are going to put some of our people out of existence anyway, and that we should try to save them more from the fires that will spread?

Dr. TELLER. That is, in general terms, precisely correct. I think that one can make careful investigation of protection against the blast, too. One should not take that problem lying down, but that is the most difficult one and the one in which probably we will have to postpone action except in special instances where one can make particularly deep and particularly well furnished shelters.

Senator SALTONSTALL. Mr. Chairman, thank you.

POOLING OF SCIENTIFIC AND TECHNICAL MANPOWER

Senator JOHNSON. Senator Kefauver.

Senator KEFAUVER. Thank you, Mr. Chairman.

Dr. Teller, I want to join in congratulating you and thanking you for your very clear and informative testimony, and our outstanding counsel upon the way he has directed your testimony.

My first question is in connection with a question that Senator Saltonstall asked. Remembering that the atomic energy was developed by distinguished scientists of other nations—some naturalized Americans, some citizens of England, Canada, and of the United States—and that we got ahead and had a monopoly on atomic energy for quite a long time—do you feel that in the past 10 or 12 years that in our missile and satellite and other scientific programs we have, to our own disadvantage, erred in not cooperating, working with scientists of other friendly nations more than we have?

Dr. TELLER. I do not know. My general feeling is in the direction of trying to urge more cooperation, and I think that some more advantage could have been had in the past. I have a very strong

and clear feeling that at present there ought to be no hesitation to go ahead with this. I hesitate to a little extent in answering your question definitely by a simple yes or no, for the following reason: Europe, after all, where most of our older help has come from, Europe was very badly shaken up in the years after the war.

In rocketry we are talking about programs of a somewhat massive character, which is not just done by a pair of hands or a single brain. And it is not quite clear to me how soon and how effectively the European countries could have contributed. I think that quite possibly they could have contributed a great deal, and I think it would have been worthwhile to explore this more than we actually did.

However, the main thing to my mind is not the past but the future, and there I have no doubts.

Senator KEFAUVER. I agree with you that we are thinking about the future. Senator Saltonstall and a number of us Congressmen about 2 weeks ago had the opportunity of attending the NATO Parliamentary Conference in Paris. At that time, Senator Jackson, as chairman of a special committee—and he is a member of this Armed Services Committee—presented a report which was worked on by scientists, intellectuals, of this country and others, which was unanimously adopted, calling for the pooling of scientific and technical manpower and for the exchanging of information, for educational programs on a NATO basis generally, and for appropriation of money by the member nations to carry it out.

This recommendation will be before the NATO heads of government in their meeting about 2 weeks from now. Have you had an opportunity of studying this program? Do you recommend it? Or what steps do you think we should take or NATO countries should take to put into effect, to implement the best use of our combined scientific and technical know-how?

Dr. TELLER. Senator Jackson was kind enough to invite me on a group of consultants.

Senator KEFAUVER. Yes.

Dr. TELLER. Which helped him, tried to help him to work out this plan, which has been presented. This group has been unanimous and enthusiastic about the plan, and I agree to it as one of them most enthusiastically. I think it is a wonderful thing to do. It is the right thing to do. I think, however, that events are overtaking us, and quite possibly by now it is not sufficient, even though at the time, a few months ago, or even a few weeks ago when we recommended it, it seemed sufficient.

Senator KEFAUVER. Would you care to indicate the fields you feel should be implemented and enlarged upon?

Dr. TELLER. Well, I would say it placed a great deal of emphasis on the help of educating scientists in the NATO countries. Now, numbers were mentioned, and I cannot quote them precisely, numbers which hoped to increase the scientific manpower in the NATO world by a few hundred a year. Probably more than that cannot be done immediately, but I think that we should begin to think very carefully how to proceed in such a way that this number should not be a few hundred but a few thousand.

Now, you cannot just multiply such a plan by a factor of 10 and hope that it will make sense. You will have to sit down and look at it carefully so that indeed it should make sense; and I think that is

the next step. I also think that some of the problems which I have mentioned, one of them I mentioned, could be taken up as a very special NATO job.

For instance, the question of weather prediction around the Atlantic basin could be a good basis for NATO cooperative and scientific effort. I think that in oceanography we have in this country two excellent laboratories which, however, operate on a shoestring, Woods Hole and Scripps on the Pacific coast. I think in this extremely promising field of oceanography we might establish active cooperation with our allies. I am sure there will occur many other instances of this kind.

INTERSERVICE RIVALRIES

Senator KEFAUVER. One final question, Dr. Teller. You have stated, as we have heard frequently, that interservice rivalries are a good thing if not carried too far, but that in connection with the scientific and missile and satellite programs, that there has been too much tendency for each service and even different units in a particular service to keep and protect and zealously guard the information they have and not pass on new developments to someone else.

Has that been one of the substantial deterring factors in our progress, and if so, how would you eliminate it? What kind of mechanism would you suggest to have better coordination?

Dr. TELLER. I think that one certainly should have the maximum possible amount of exchange and cooperation. I suspect, and I am not close enough to the field to be able to assert it, but I suspect that already quite a bit of cooperation exists. I can cite you an example. A short time ago I was invited to chair a meeting in which representatives from various industries were invited to make proposals, and there was some worry that they would protect their particular company secrets and wouldn't talk out, and some thought was given to the idea that each of them should report to the investigating group separately.

Well, some of us made the proposal this is evidently not right, these people should be in exchange with each other, they should stimulate each other. Let us ask them to talk without restraint in each other's presence. We asked them. They had no objection. The meeting went on, and if I am any judge of what happened, it was completely clear that these people liked it and did it. I suspect that there has been already in the past many cases where the technical people involved in the various competitive enterprises did their best to cooperate. I think this must go on and must be strengthened. I think it will. I do not think that the situation in the past has been bad, but I do believe that it can be improved, and I think through a coordinator and by stimulating exchanges this can and will be done.

Senator KEFAUVER. Thank you very much, Mr. Chairman.

Senator JOHNSON. Thank you, Senator Kefauver.

Senator Flanders.

RUSSIAN PROPAGANDA. MISSILE PROBLEMS: PROPULSION, DIRECTION, REENTRY

Senator FLANDERS. I would like to join, sir, in saying that this has been—I will put it in the superlative—this has been the most stimulating witness, Mr. Chairman, that has ever come before this committee in my membership on it. That is a superlative statement.

Now, as I understood you with reference to what we know about the launching of the satellites and their connection with the intercontinental ballistic missile, we may say that the Russians have solved the problem of propulsion?

Dr. TELLER. Indeed.

Senator FLANDERS. If I understood you, we may assume that they have solved or soon will solve the problem of reentry?

Dr. TELLER. Right.

Senator FLANDERS. You expressed, as I remember it, a lack of knowledge as to whether they had solved the problem of direction so far as being able to put a missile on a target is concerned.

Now, I would like to ask whether there is any validity to this point? We are considering the ICBM as a military missile. We therefore require the greatest refinement in direction that we are capable of devising. Does the Russian Government, the Soviet Government, necessarily need that great accuracy of direction if it considers the weapon as a political weapon of terror rather than a military weapon.

Dr. TELLER. I believe that there is clearly validity in an argument of this kind. I would, however, like to add to it, I believe that the development of accuracy, while difficult, is not extremely difficult. I think that this development is almost certainly taking place in such a broad and well-founded effort as we have seen the Russian effort to be.

Futhermore, accuracy of delivery can be extremely valuable to anyone, for most obvious reasons. For instance, it makes the possibility of retaliation very much harder if they have a very rapid and very accurate weapon. I would say that the overwhelming probability lies with the statement that the Russians either have developed or are going to develop accurate guidance, and certainly we should, in commonsense and in order to insure our safety, assume that this is likely to be so.

Senator FLANDERS. The point I was trying to bring out was this: that while from the Russian standpoint accuracy of guidance is a very strong requirement, yet the very fact that they can get a missile to England, on to the United States, on to any place they wish to, just get it into that country, is a tremendous political asset on their part even though they never send it?

Dr. TELLER. This is obviously true.

Senator FLANDERS. So that they with political purposes and terror purposes in mind now have an instrument probably toward which we are not directing our development and do not wish to direct our development, that is, we are not interested in starting pure terror. We are interested in reaching a military target.

Dr. TELLER. This is correct. Also, one should say that our work on guidance, as far as I know, does not interfere with our work of propulsion. I don't think that we need say at all that our work on propulsion has suffered because we have overemphasized guidance.

Senator FLANDERS. Now, a technical question. Let us suppose that we send up an atomic or a hydrogen warhead on a long-range missile, or let us suppose that the Russians do. Supposing the reentry problem is not solved and that warhead burns up as it comes down through the atmosphere. Does that explode it?

Dr. TELLER. I did not hear the last word.

Senator FLANDERS. If it burns up coming down through the atmosphere, does that fact explode the atomic or hydrogen warhead?

Dr. TELLER. It can be so arranged that an atomic or hydrogen warhead is exploded on reentry. If it is not so arranged, then, of course, the warhead is destroyed.

Now, I should like to say that if the warhead burns up, there is, I think, every probability that it will burn up so high in the atmosphere that the exploding atomic or hydrogen warhead will not cause any serious damage.

PHOTON PROPULSION

Senator FLANDERS. That is really a matter of interest that I raise that question, but I presume it has some practical aspects.

Now, the Russians, some Russian scientists, have been giving out statements to the papers about photon propulsion. Is that just hogwash or is there a scientific possibility there? I do not want you to get into the position that Lord Rutherford was in so many years ago, but what do you think? Is photon propulsion anything or not anything?

Dr. TELLER. I would like to say that I should have been honored to be in the same position and to be mentioned in the same sentence with Lord Rutherford, and I am sure that I will make worse mistakes than he made at that time.

I would like to say this: I do not know of any scheme along the direction of photon propulsion that makes sense. The idea of photon propulsion just in this simple, blunt way is something which occurs very easily. Its feasibility might be quite difficult. In the various possible applications of nuclear rockets, in rocketry, I should like to make this statement: That we probably will need nuclear propulsion if we want to explore the planetary system.

With or without nuclear propulsion, I am sure the planetary system can be explored, and nothing like photon propulsion, even if it is possible, is needed. However, when you want to go to the next star, which is so distant that light takes 4 years to get there, then you have to get rockets which really move fast; and with the best nuclear propulsion that I can imagine today, it will still take more than a hundred years to get to that next star, and that is a bit on the longish side for a journey. Really exotic methods of propulsion might have to be devised, will have to be devised to get there. How it will be done, I don't know. Whether it will be done, I am not quite certain. But I would bet it can be done either by something like photon propulsion that I have heard about, but do not understand, or by some other means which I also do not understand and have not even heard about. [Laughter.]

Senator FLANDERS. Of course, there is an alternative on this 100-year expedition, and that is to man the ship with an expanding population.

Dr. TELLER. That possibility might indeed exist.

DEFEAT WITHOUT WAR

Senator FLANDERS. Now, one last question: You suggested that we might be defeated without war, and gave a single instance which was that of Russian control of the weather.

Dr. TELLER. Yes.

Senator FLANDERS. Which left us high and dry. Have you any other possibilities in mind of that defeat without war?

Dr. TELLER. I would like to suggest another one, although I am pretty sure that the number of examples can be multiplied. I should introduce it by saying that to try to predict scientific developments is a real hard job because science generally is the activity in which the unexpected is the almost regular thing to happen. It is probable that none of the special examples I give will come to pass, but something similar might. I would like to give another example. Consider, for instance, applied oceanography.

EXPLORATION OF THE SEA

Consider exploration or more general utilization of the minerals at the bottom of the sea. Oil is, of course, the best known. We know that we are exploiting oil near our shores to a limit of 3 miles or 15 miles or whatever it is. If you go out from a continent, the sea deepens rather gradually for a distance of 50 miles, 100 miles, 200 miles. This relatively shallow region in the sea, as you probably know, is called the Continental Shelf in a rather descriptive manner. Beyond that, the sea starts deepening quite rapidly and that is what is called the abyss.

According to our present knowledge, there cannot be expected a great mineral wealth in the abyss, although that knowledge might be mistaken. But there is every reason to expect quite a bit of mineral wealth on the continental shelves. What if the Russians begin to exploit the richness of these continental shelves all over the world? International law still says that sovereignty extends to 3 miles or, at most, 15 miles out to sea. If they just beat us to the techniques, they can be all over the world doing this exploitation.

There is another field also in the sea. We have so far fished in the sea but we have done very little to care for the plant and animal life in the sea. We have developed agriculture. We have not developed "mariculture." What if the Russians begin to cultivate the oceans, find ways to breed fish, protect these fish, and then tell the Japanese, "Come in and fish with us under certain very agreeable conditions"?

Senator FLANDERS. That is H. G. Wells, purple algae. I do not know whether you know that or not.

Dr. TELLER. I am an enthusiastic reader of H. G. Wells, and, in fact, it is practically the only science fiction I read. However, I do not remember the purple algae.

Senator FLANDERS. That is all, Mr. Chairman, and thank you.

Senator JOHNSON. Thank you very much, Senator Flanders.

Dr. Teller, the committee will take a recess until 2:30, at which time we will resume the questioning and Senator Stennis will be followed by Senator Smith, Senator Symington, Senator Case, Senator Bush, and Senator Barrett in that order.

We will recess until 2:30.

(Whereupon, at 1 p. m., the hearing was recessed, to reconvene at 2:30 p. m.)

(Also present, in addition to those present at the morning session: Senator Wiley.)

Senator JOHNSON. The committee will come to order.

For the information of the press and radio and television people, and the photographers, all of whom have been so cooperative with the

committee, I should like to announce we do not plan an evening session today. We do not plan an evening session on Tuesday.

It is very likely if we have not concluded with the witnesses we now have scheduled, that we will have an evening session on Wednesday.

I should like you to have as much advance notice as possible. As soon as that is definite, I will inform you.

TESTIMONY OF EDWARD TELLER—Resumed

Senator Stennis, will you proceed with the questioning?

Senator STENNIS. Mr. Chairman and Dr. Teller: Dr. Teller, I want to add my word of appreciation to you for your splendid testimony this morning, and also say that I think the American people not only are assured by your knowledge and suggestions, but also by your fine sense of humor, coming from a gentleman so learned in the sciences who contributed so much to many programs, including the hydrogen bomb.

Now, one thing that I want to direct your attention to was your emphasis on what could be done. I believe what you listed first was to be certain about our SAC defenses, Strategic Air, and the next was that you said we could accelerate as well as expand our missile program.

UNIFIED AUTHORITY TO CORRELATE PROGRAM

And in connection with that, you said that we needed someone who could go into the programs that are already being done in an excellent manner, and pull them in together or correlate them and pool their efforts.

Were you referring there to someone who not only has the ability to correlate these programs, understand them, but someone with the authority to say which ones would proceed; in other words, someone with unified control, with authority to act? Were you referring to that?

Dr. TELLER. Yes, sir; I was referring to that. I understand that this is already being done. I would certainly hope that this power will be exercised——

Senator STENNIS. Yes.

Dr. TELLER (continuing). In a gradual and increasing way, and also I hope that it will be mostly used to direct the efforts in the most fruitful way, rather than saying which one should proceed and which one should stop, because I believe that in a great many fields, valuable work has been done. And I, of my own knowledge, which is very limited, would certainly not suggest that any of the efforts that went into the rockets has been a waste.

Senator STENNIS. Yes.

But you are firm with the idea that, even though such a unified control or correlation could not be done abruptly, it should be done by all means?

Dr. TELLER. That is my—that would be my suggestion.

Senator STENNIS. Do you not think that the person who is charged with that responsibility ought to have the power and the authority to say what should be done and the authority to put that project through?

Dr. TELLER. That is what I would hope, and I would hope that such authority should be at first exercised with quite a bit of discretion, and later perhaps more fully.

Senator STENNIS. Yes.

And that authority to see this decision through, it should include the authority even to go over the Department of Defense, if necessary, or should be authority that would go over the Budget Bureau, if necessary; is that not true?

Dr. TELLER. I feel, sir, that I have too little experience in organizational matters. When you mention the Bureau of the Budget—

Senator STENNIS. Correct.

Dr. TELLER (continuing). You, of course, have not mentioned a very popular bureau at this very moment.

Senator STENNIS. Yes. I understand. You would not want to go into that phase of it.

But you unqualifiedly said there must be a unified authority with power to act.

Dr. TELLER. That seems to me commonsense.

Senator STENNIS. From the standpoint of a scientist.

Dr. TELLER. This seems to me commonsense, not from the standpoint of a scientist, but just plain commonsense.

Senator STENNIS. Do you know of your own personal knowledge whether anyone has actually been authorized yet to exercise this power or this control that you speak about?

Dr. TELLER. I understand that this has been done, but my experience in administrative matters is much too limited to understand whether it has been really done or not. I mean that goes way beyond my knowledge and my experience.

Senator STENNIS. You have not checked into it to know?

Dr. TELLER. I certainly did not.

SHARING SCIENTIFIC KNOWLEDGE, UNITED STATES AND ALLIES

Senator STENNIS. One other question now.

You spoke this morning about sharing scientific knowledge. I do not just know that I remember all the points you made, but I want to know, you were talking about sharing knowledge as between scientists of this country and also scientists of other countries.

Would you enlarge on this: Has there been any lack of sharing scientific knowledge as between those working on these various missile projects? Take that part of it first. Were you referring to any weakness that you know of through the lack of correlation or sharing of knowledge on this missile knowledge?

Dr. TELLER. My understanding is, there has been sharing of knowledge, but also that it has been within the United States less than complete.

Senator STENNIS. Less than complete as between the groups working on our different missiles?

Dr. TELLER. This is my general understanding.

Senator STENNIS. Yes.

Dr. TELLER. But I may easily be mistaken. I am not sufficiently familiar with the details.

Senator STENNIS. All right.

Coming, then, to your suggestion on sharing this knowledge, would that involve through treaties and NATO or organizations of various kinds? Was that your reference?

Dr. TELLER. This would be my understanding. I am quite sure that if you want to share secret information, then you will certainly want to discuss first carefully in what way secrecy should be guaranteed on the level of, let us say, NATO or some other form of treaty. And I am quite sure this has to be threshed out in detail, and secrecy is a difficult question every time, and it will fit into every country's functioning in a slightly different manner.

So I am quite sure we are raising here questions which will have to be considered, but I feel that one should try to overcome these difficulties, and through treaties, through discussions, get to a point where we can effectively and with a minimum danger share our secrets.

Senator STENNIS. We will have legislation recommended to us, probably, for the sharing of this scientific knowledge, and I would like to have the benefit of your observations on it, was the reason I was asking these questions.

So when you recommend that the sharing of this knowledge be had, it is subject, of course, to these safeguards that you have just referred to, and some kind of plan as between international organizations; is that correct?

Dr. TELLER. That is correct.

Senator STENNIS. Well, I thank you, Mr. Chairman. I believe that is all the questions I have.

Senator JOHNSON. Thank you, Senator Stennis.

Senator Smith?

Senator SMITH. No questions, Mr. Chairman.

Senator JOHNSON. Senator Symington?

Senator SYMINGTON. Dr. Teller, I join with all those people who have complimented you on your magnificent testimony this morning.

The evenings that you and I have spent together in Washington, Missouri, and California have had much to do with forming my own opinions, and I think it is very fine for you to come up here and be such a lucid, intelligent witness on what may well be the most important subject we have to deal with today.

RUSSIA WILL HAVE BEST SCIENTISTS IN 10 YEARS

I would like to ask a few questions, if I may.

Fairly recently, you said that—

Ten years from now, the best scientists in the world will be found in Russia. I am not saying this will happen unless we take this or that measure. I am simply saying that it is going to happen.

That is a pretty pessimistic view. Would you comment on it at this time?

Dr. TELLER. Well, I said this, and I would be—and I repeat it. I believe that this is what we have to expect. I said it essentially for two reasons:

One is the observation which I have made here repeatedly, that Russian science has been catching up with us at such a rate that where there was a great difference after the war, there is not much of a difference now; and if there is one, then one is not quite certain in whose favor.

Therefore, just extrapolating the strength in a very simple-minded fashion, one would expect this disagreeable thing to happen.

I also would like to say it for the following reason: I believe that in science, young people make probably a greater contribution than in other fields, proportionately greater contribution.

BETTER SCIENCE EDUCATION

Now, from everything we were able to find out from behind the Iron Curtain, it seems clear that the young people in Russia, let us say between the ages of 10 and 20, have a considerably better science education than the similar age group in this country.

Ten years from now, these young people will carry the burden of science in Russia and in our country, and, therefore, since they are better prepared, I feel that it is a foregone conclusion that they will do the better job.

I therefore think if one looks at the situation realistically, one must not say that we ought to retain leadership in science, but rather, that we should do everything in our power to regain that leadership.

Senator SYMINGTON. Thank you, Dr. Teller.

TO SUBMIT EDUCATIONAL PLAN

Have you ever presented in detail, any educational plan? If not, do you think you can furnish for the committee records what you believe we must do in our effort to catch up, from the standpoint of education?

Dr. TELLER. I have never done this, and if I should be asked to do it, I will try my best, because I dare not refuse the challenge.

I believe that it is a very difficult assignment, and I would be a little more confident about my diagnosis than I would be about any cure which I can propose.

Senator SYMINGTON. Will you consider this as a personal request?

CORDINER REPORT

Have you heard about the Cordiner Committee report, the Cordiner Committee?

Dr. TELLER. I heard about it, but I am not familiar with it.

Senator SYMINGTON. The report says that if we spend around a half billion dollars now, within 5 years we will save over \$5 billion a year. Of course, all of us want maximum defense at minimum cost.

HOLDING TRAINED PERSONNEL

What are your further thoughts, because you dwelt on it at some length this morning, about the importance of getting trained people, and holding trained people, in the Military Establishment?

Dr. TELLER. I believe that perhaps to add to what I have said, that in the minds of our own scientists there has been too great a distinction, too great a separation between academic work and work for practical use, particularly work for the Military Establishment.

I think that the present urgency which has been created by the Russian ICBM and sputnik will help in this situation.

I also believe this: That not for all people, but for quite a number of people, perhaps for the majority of the scientists, it is a healthy experience to spend some time at a university in pure research, then maybe go into military work, and then maybe come back to the university work.

The tools are similar, the intellectual activity is similar. The distinction between the two kinds of work appears greater than it is. The broader experience that one gets by varying one's occupation to this extent, I think, is really beneficial in many cases to the scientist himself. I have seen that in explicit personal examples.

Senator SYMINGTON. Thank you, Doctor.

DIFFERENCE BETWEEN ROCKET EFFORTS

You mentioned this morning you thought our rocket effort was good, but that the Russian effort was better.

Would you expand in any way on what you think we should do to make our missile effort at least equal to the Russians?

Dr. TELLER. I think we should speed it up, I think that we should diversify it, particularly by undertaking now more research-type work, the type of work which is in the \$10 million to \$50 million per year class.

I think that these research efforts should be directed toward preparation for the next step beyond the immediate military goal, toward the next generation of rockets beyond our first IRBM and ICBM capability.

I think, furthermore, that this research effort should be directed toward satellites and toward space exploration. In this field of research sputnik has made the recruiting problem a particularly easy one.

Immediately after sputnik quite a few of my younger colleagues came to me and asked me, "How can I help?" and in most cases my only answer is, "Wait and store up your enthusiasm for a few more weeks until we find out how you can help."

IMPORTANCE OF MANNED BOMBER

Senator SYMINGTON. Now, you mentioned the question of the importance of SAC's capacity for retaliation.

Since sputnik, we have had a great many pages about ballistic missiles, and other weapons of the future, in the press.

But we have not had very much about the importance of existing forces; and inasmuch as we both know we won't have ICBM's operational for some years, if we are forced into defending ourselves, of course, we must use existing forces.

As I understand it, you are not one who thinks that today, or for years to come, the manned bomber is obsolete. Is that correct?

Dr. TELLER. I am convinced that the manned bomber is not obsolete now, that we need to rely on the manned bomber for retaliation during the time in which we do not have a real rocket capability.

I hope that this time can be made short by a determined effort. But I furthermore believe that even after we get a rocket capability, the manned bomber still will not be obsolete.

A rocket can hit a target, of which you know. A bomber can fly out and look for the target, for targets which you may not know of

right now or whose location is not exactly available or even targets of opportunity.

For instance, in limited warfare situation like Korea, you are trying directly to assist your own operations and to attack some enemy concentrations or enemy positions. You should do this with a weapon which does not merely have a fist but also eyes.

Senator SYMINGTON. Thank you, Doctor.

RUSSIAN PROGRESS IN MISSILE PROBLEMS

This morning, as I got it, you said you believed the Russians have solved the guidance problem, the propulsion problem, and the reentry problem. Is that correct?

Dr. TELLER. The way I would like to put it is this: It is quite possible that they have solved all of these problems, and it is the safe assumption on our part, an assumption which we have to make for our own safety, that indeed they have solved these problems.

I would say that we do not know that they have. What we know is that they have solved the propulsion problem and they have made a very considerable step toward solving the guidance problem.

I believe that in case the assumption that they have solved all three problems is mistaken. I have little doubt that what remains to be done they can do in a rather short period.

Senator SYMINGTON. Thank you, Doctor.

UNITED STATES SURPRISED AT SPUTNIK

A recent article stated you said the Soviet sputnik came as a shocking surprise to the United States public, but was no surprise to United States scientists. Do you remember that?

Dr. TELLER. Yes, sir.

Senator SYMINGTON. And then this morning you talked about closing the gap between the scientist and the common man.

INFORMING THE PUBLIC

My final question is, Do you feel there is considerably more information which could be gotten out in this field that would not help the possible enemy, so that the public would know more about these matters?

Dr. TELLER. I am not sure. In the particular field of military-type information I would not like to assert it with conviction. I have not thought about the question sufficiently. I would believe that it would be possible, healthy, useful, better to inform our public about the precise military position in which we find ourselves, because I am sure that ultimate decisions go back to the public and therefore it is absolutely necessary that they may be well informed indeed.

Senator SYMINGTON. Let me rephrase the question this way:

You say sputnik was no surprise to the scientists.

Do you feel that public opinion, the American people, could have been prepared for it more than they were, without at the same time giving away secrets?

Dr. TELLER. I would think that the answer is "Yes."

I am afraid when I said that sputnik was no surprise to the scientists, perhaps I have overstated the case.

It was no surprise to some scientists, and generally it was a lesser surprise to the scientific community, a considerably lesser surprise, than it was, as far as I can judge, to the public.

Senator SYMINGTON. Thank you, Dr. Teller.

Thank you, Mr. Chairman.

Senator JOHNSON. Thank you, Senator Symington. I may say this concludes the questions of the members of the subcommittee.

We have Senators who are members of the full committee and we are anxious to have them participate as fully as possible.

I would like to welcome in the room the distinguished former chairman of the Committee on Foreign Relations and the ranking member of the Committee on Foreign Relations, Senator Wiley. We are glad to welcome you, and if you would wish to ask some questions after the members of the committee do so we would be glad to have you ask them.

Senator JOHNSON. Senator Case?

Senator CASE. Thank you, Mr. Chairman.

Dr. Teller, I want to add to what has been said about the admiration of your testimony given at this hearing.

The first question I want to ask relates to the matter of an actual testing.

You stated this morning that we could not hop along on the theoretical side of development or research that an actual testing was necessary.

DETECTION OF RUSSIAN MISSILES

Having that in mind, is it beyond the present capabilities of our receptive devices for the Russians to test an intercontinental ballistic missile without its being known and detected by us?

Dr. TELLER. I do not know. I think that this is a highly technical question. I am of the general opinion that when you are trying to hide something, you have an easier job as compared to the position when you are trying to detect something.

There are all kinds of ways how, if you try to hide your activities, you can succeed. But it is a game played with great skill by both sides, and I would say that while detection is possible, that it certainly is not a cinch.

Senator CASE. But the principle you stated with regard to the necessity of making an actual test would apply to the Russians as well as to us.

Dr. TELLER. May I ask, I did not quite clearly understand: Are you talking about rockets or about nuclear explosions or both?

Senator CASE. Well, whatever would be involved in the production of an operational ICBM?

Dr. TELLER. I would like to answer the question, whether the Russians need testing in the following way: Generally, testing is a very necessary step and I should say it is a necessity on their part also.

However, there is a little evidence that we have been a little more conservative than the Russians, and that they are willing to take perhaps somewhat longer steps, if need be.

This is my impression and it need not be a correct one.

Senator CASE. Thank you.

STRATEGIC AIR COMMAND

The second question I wish to ask has to do with the maintenance of the capabilities of SAC.

You placed that first in the list of five things you mentioned in response to the chairman's question, and I assume you gave that high priority.

Did you have in mind anything particularly in connection with the SAC organization that gives you concern at this time?

Dr. TELLER. I know too little about organizational questions. I have, on a number of occasions, visited the SAC headquarters, and I have the greatest admiration for the way they are running their business, and I think that their organization is fine.

At the same time I am sure that their operations can be improved to a great extent by giving them enough money to do the things which they had been advocating for some time.

Senator CASE. I did not want to lead your answer in any respect, but I was wondering if you had reference to the matter of the dispersal of the planes accorded to SAC?

Dr. TELLER. I think that the dispersal of the planes is probably the most, I would say is the most, reasonable first step to take. I may have misremembered, but I thought I had mentioned that already; I did not give this answer right away, because I did not realize that this was within the realm of your inquiry.

Senator CASE. Thank you.

WEATHER CONTROL

The third question I wish to ask relates to the thing you mentioned when you were talking about a long-range picture, and that was the possible study of weather control by the Russians, implying, I would assume, thereby, that we ought also to be concerned about possible weather modification or control. You referred to smog as giving you some reason for thinking that there might be something in weather modification.

Dr. TELLER. Excuse me; I referred to a subject which you quoted and which I did not identify.

Senator CASE. You did not identify it?

Dr. TELLER. I am sorry; I did not understand you.

Senator CASE. I thought you referred to smog as giving evidence of the possible effect.

Dr. TELLER. Smog—s-m-o-g. I don't think I referred to that at all.

Senator CASE. Did you have anything specific in mind? Do you have any knowledge of Russian activities in this field?

I might say that the reason I ask this question is that, as you probably know, we have had the Advisory Committee on Weather Control, which is about to conclude its studies and report to the Congress by the end of December.

The Senate has already passed the bill to authorize the National Science Foundation to carry on a program of research in weather modification. The bill is now pending in the House.

In view of your references to the possibilities of weather modification or control by the Russians, I was wondering if you could elaborate

on that and, perhaps, give us the benefit of any opinion you have or any knowledge you have of their work in that field.

Dr. TELLER. I cannot say more, I have no more knowledge. I mentioned this subject as one which might become very practical. Much more intensive work on weather prediction is the main thing which I would be interested in, because I believe that, eventually, it will lead to the possibility of weather modification.

Senator CASE. And you would regard any study that would—any basic research that would give us greater knowledge in the prediction of weather or the possibility of modification of it as worthy of attention by the Congress.

Dr. TELLER. I would consider that as most worthy, very definitely; yes, sir.

Senator CASE. Thank you very much.

Mr. Chairman, I hope, if there is something in this field, that we may pursue it so that we are not left high and dry by the Russians claiming all the rain.

Senator JOHNSON. I know of the Senator's great interest in this particular field. I have cooperated with him on measures that have passed through the Senate, and I appreciate very much the interest that has been demonstrated here.

Senator BUSH?

Senator BUSH. Mr. Chairman, I have no questions, but I do want to join with the other Senators in complimenting Dr. Teller for a very splendid presentation today.

Senator JOHNSON. Thank you, Senator Bush.

Senator BARRETT?

Senator BARRETT. Thank you, Mr. Chairman.

Dr. Teller, I am at the bottom of the totem pole of this committee, so I will be very brief. I know you have been very kind here in testifying before the committee, and I want to join with all my other colleagues in congratulating you on the fine presentation you have made on this problem.

EXPAND AND ACCELERATE MISSILE PROGRAM

As I understand, Dr. Teller, you intimated this morning that we might expand or accelerate our missile program by utilizing other scientific capabilities which are available in this country, and I was wondering if you were referring to companies that work in that field or to individuals.

Dr. TELLER. To both.

INTERESTED COMPANIES

I had primarily in mind the possibility of drawing into the effort additional companies which have demonstrated or can demonstrate their ability, and which are not now involved in other really essential work.

INTERESTED SCIENTISTS

At the same time, it is certainly true that among our own scientists there is a great wave of interest in this field, which has not occupied their minds so far very greatly.

Many of them would welcome the possibility to make a contribution at the present time, would be happy to go into practical work where previously they had been interested only in basic work. Now, I think that some of these who have a desire to, I should say all of these who had a strong desire to contribute, should be encouraged to contribute, and I believe that you will have no shortage of people who try to help.

Senator BARRETT. Well, I certainly agree with you, Dr. Teller. Would you say the reason they have not been utilized in the past has been because of the fact that there have not been funds available?

Dr. TELLER. I think the plain reason is that the situation overnight has become so dramatic. Our attention has been drawn to this. Many of these people, young people, have enjoyed their usual normal and basic work, so that contributing to another field, in many cases, would not have even occurred to them.

Now, quite a few of them say to themselves, "This is a serious situation. We can help, or I can help. What can I do to help?" I think it is just the same normal response that you find throughout the country.

Senator BARRETT. I am sure that is true, Dr. Teller. I was wondering if you were suggesting that we put this program on a crash basis, on around-the-clock operation, and call in these other people to help. Is that the idea?

Dr. TELLER. Sir, perhaps yes. But I don't like the word "crash"; it somehow does not have the right implications.

I would like to say let's accelerate and let's be quite careful about the way we accelerate, and then let's accelerate as vigorously as we possibly can.

Senator BARRETT. Well, thank you very much, Dr. Teller.

EDUCATIONAL SYSTEM

There is one other question which has occurred to me. Apparently, our educational system in this country is not up to par, as far as Russia is concerned, in training our young people in this scientific field. I was wondering if the fact that their armed services are training a lot of these young boys who come into the different branches of the service compensates in any degree for the fact that our school system has not taken hold.

Dr. TELLER. I think that the contribution from the armed services to the educational situation is very welcome, but I do not think that, in the particular connection in which I am making my suggestions here, you need to have that in mind.

Our greatest shortcoming is not at the university level, but it is at the levels of elementary education and high school, and the Armed Forces get into the level of the more mature people, of the university people.

Now, improvement on the university level is important, too. I certainly would not like to appear ungrateful for the way in which the Armed Forces have contributed to our work.

But I should say that when you talk about educational systems, the decisive battles will be fought in a field where the Armed Forces cannot contribute, because we are concerned here with youngsters who are not yet ready for the Armed Forces.

Senator BARRETT. Thank you very much, Dr. Teller.

Thank you, Mr. Chairman.

Senator JOHNSON. Thank you, Senator Barrett.

Senator WILEY, any questions?

Senator WILEY. Mr. Chairman, I feel flattered, I have not heard most of the testimony.

I don't know what fields he covered this morning but I am sure that I can read the testimony with profit.

Senator JOHNSON. So do I.

Counsel, do you have any additional questions?

Mr. WEISL. No, sir.

Senator JOHNSON. Senator Saltonstall?

Senator SALTONSTALL. No questions.

Senator JOHNSON. Senator Kefauver?

EXCESSES IN SECURITY SYSTEM

Senator KEFAUVER. Mr. Chairman, if I may I would just like to ask one question and Dr. Teller may not want to comment on it.

I have felt some of the excesses in connection with our security system, some of the attitudes of Congress in connection with investigations, and even confirmation of appointees, may have discouraged young people from seeking Government employment in scientific fields, may have even discouraged people from taking up scientific careers.

You don't have to express yourself about it if you don't want to of course, but if you have any comments I would like very much to know how you feel.

Dr. TELLER. Senator Kefauver, this is obviously a very difficult question, and I hesitate to answer it because it is so difficult.

I would like to say this: Certainly excesses in security proceedings are very harmful.

In the particular field which I could observe, namely, in the application of clearance procedures within the Atomic Energy Commission, I have had plenty of evidence that the security rules, which of course by their very nature are painful, have been applied conscientiously and with discretion, and I want to talk only about the Atomic Energy Commission's work, because this is the only one where I had any experience.

I also would like to say this: when one has a situation where secrecy and security are necessary, that is in itself a handicap, and we should recognize it as a handicap, and understand that secrecy has a value, and we will have to pay some price for it.

I should think that you are right that some people, some young people have been frightened away from scientific careers because they heard about such excesses.

I cannot comment and should not comment here about actual examples of such excesses, but I am sure that the great majority of the people who have been connected with security work have done their very best to avoid such excesses, and furthermore, too much talk about that subject in itself frightens people away, because there can be an excess in criticizing the excesses.

Senator KEFAUVER. Thank you, Mr. Chairman.

Senator JOHNSON. Senator Flanders?

Senator FLANDERS. No further questions.

Senator JOHNSON. Senator Stennis?

Senator Smith?

Senator SMITH. Mr. Chairman, I would like to make an observation.

WEATHER CONTROL

Dr. Teller, I was most interested in your observations about the potentialities of Russia effecting weather control.

Two years ago, about this time, I was in Moscow, and visited the agricultural fair and exposition there.

I saw a series of lighting effects and scenic staging portraying what the Russians claimed they could do in the line of weather control in changing, converting frigid barren areas into tropical areas.

I discounted it, thought it was somewhat exaggerated.

I have quite changed my mind at this time.

I would like to ask you from what you have said, in your opinion, do you think—how soon do you think the Russians can make it difficult for us with their weather control plans?

Dr. TELLER. Senator Smith, this, of course, I cannot answer. To influence the weather is merely a possibility.

I would be much more confident about getting to the moon or to the planets than influencing the weather.

But, nevertheless, influencing the weather is a possibility.

Now, the second reason why I don't know how to answer your question is that of course I am quite uninformed about the special things that the Russians are doing.

I merely try to point that out as a general field in which exceedingly important work can be undertaken, and I would guess, and that is a very, very poor guess, that the Russians are undertaking it.

I must say that I personally would not be surprised if in a short time like 5 years they would succeed in doing something quite substantial. I would also not be surprised if I would live for 50 more years, and even by the end of that period nothing would have happened.

It is a possibility that is with us, and it may take a short time or it may take a long time or it might be effectively impossible, although my guess is always that it is possible.

Senator SMITH. Thank you, Mr. Chairman.

Senator JOHNSON. Have you concluded, Senator Smith?

Senator SMITH. Yes.

Senator JOHNSON. Senator Symington?

Senator SYMINGTON. Mr. Chairman, I have several more questions.

MISSILE LAUNCHING SUBMARINES

Dr. Teller, we have heard a lot about SAC today. Some of us are worried about the fact that, according to testimony, the Soviets now have around 10 times as many submarines as the Nazis had when they started World War II.

From your own knowledge of the military problem do you believe these submarines including their missile potential, are a possible menace to the security of the United States.

We know we have submarines that can launch missiles.

Therefore, following your general line of thinking, and from the technological aspect, our assumption should be that they have too.

We talk a lot about the Air Force. How about this problem?

Dr. TELLER. I think a missile-carrying submarine is a menace and a grave menace.

Senator SYMINGTON. Thank you, Doctor.

SOVIET ACADEMY OF SCIENCES

There is a book put out by the Stanford University Press given to me by Mr. Peek, former head of Standard of Indiana and President Sterling of Stanford University at a dinner to Mr. Herbert Hoover recently. It is called the Soviet Academy of Sciences. Are you acquainted with this book compiled at Mr. Hoover's library?

Dr. TELLER. I am not, sir.

Senator SYMINGTON. In the first part it says that this Russian academy, in 1950, was 225 years old; that that in the middle of 1949 it had 20,100 people working, of which 6,053 were scientific workers. That its research was carried out with 6 institutions, 15 laboratories, 4 observatories, 7 museums, 7 stations, 51 committees and commissions. It had 16 branches, dispersed throughout the country, including 4 institutes.

It also served as an official agency entrusted with the task of coordinating and guiding the work of the 12 academies of sciences of individual Socialist Soviet Republics.

Today it says the academy has made its influence felt in the highest scientific organizations of all countries large and small which find themselves under Soviet political domination.

Presumably that was the type and character of functioning you were referring to when you stated that all of this advancement in recent years did not come from the Germans. Is that correct?

Dr. TELLER. It is correct. The academy to which you are referring is known to be an extremely powerful institution and one that is most vigorously alive.

Senator SYMINGTON. Here is an Academy of Science that was formed and operating many years before this country itself was formed. It gives a list of the academy members. Under the 40 or 50 members listed as physicists the oldest one is 1920, Mr. Ioffe.

OUTSTANDING SCIENTISTS

Dr. TELLER. Ioffe.

He is a very well known man.

Senator SYMINGTON. And his specialty was cosmic-ray energy electronics and molecular physics just after World War I.

Right under him is Mr. P. L. Kapitza, who got his membership in 1939. Presumably that is Peter Kapitza.

Dr. TELLER. Right.

Senator SYMINGTON. He specialized in low-temperature physics, properties of substance under the influence of powerful magnetic field at low temperature.

Is it a fair statement to say that Professor Kapitza is a foremost nuclear physicist?

Dr. TELLER. I think that his interest as far as I know has not been in nuclear physics. But I am not sufficiently familiar with his more recent work.

Senator SYMINGTON. Is he the one who spent many years in England?

Dr. TELLER. That is correct. And in England, he worked in the field which you have mentioned, low temperature and magnetism which are extremely important fields.

SOVIETS DEVOTED MANY YEARS TO SCIENCES

Senator SYMINGTON. What I was trying to bring out, Doctor, was that this book would seem to be conclusive proof of the fact that, for a great many years, the Russians have been intensely devoted to the whole problem of physics and the surrounding sciences.

Would you agree with that observation?

Dr. TELLER. I agree with it absolutely and it is quite clear that old and solid support is beginning to pay off.

Senator SYMINGTON. Thank you.

Senator JOHNSON. Thank you, Senator Symington.

Senator Case, any additional questions?

TOO RAPID REORGANIZATION

Senator CASE. Mr. Chairman, I don't have a question but I would like to ask Dr. Teller if he would develop a little bit more the thought he expressed this morning about not rocking the boat by too rapid reorganization of effort.

It happens that with some other members of the committee I recently have been looking at some of the rockets that are presently being developed, and when you made that statement this morning it occurred to me that to throw away some of these that are in mid-stage of development might be quite disconcerting and disruptive so that when you said that this morning, I noted it and I would be glad to have you develop that a little bit in order to give us guidance possibly for recommendations with regard to reorganization, if any, or in what directions.

Dr. TELLER. Well, I do not think that I am the proper person to make a recommendation in any detail.

But I would perhaps like to restate a special case which you might find easy to apply.

DEVELOPMENT OF SIMILAR ITEMS

Suppose that essentially the same object for the same purpose is being developed at two places, and that both these developments turn out to be successful and that indeed there is not much to choose between the two.

You might then try to keep both of these efforts and maintain the spirit in both of them by, for instance, a measure of this kind:

One might be closer to being adaptable to mass production, in which case you might think, or perhaps not you, but the coordinator, the man in charge of these things might find that this weapon indeed should be pushed along as a workhorse in the rocket field.

The other instead might have the advantage of somewhat greater flexibility, less standardized parts.

In that case you might select that as the tool, as the instrument by which we make further advances into satellite and space research.

It would seem to me that such proposals could be quite fruitful. I don't know whether that might serve as a brief illustration.

Senator JOHNSON. Thank you, Senator Case.

Senator Bush?

CONGRESS AND EDUCATION

Senator BUSH. I would just like to go back to one thing, Mr. Chairman, and that is the question of education in the primary and in the secondary schools that Dr. Teller spoke of this morning.

And the very great necessity for stimulating teaching in those schools and in procuring better teachers and holding on to them.

Now, the business of education, as the Doctor well knows, is primarily, if not wholly, at the elementary school level, and the secondary school level, a matter of local or municipal and perhaps State obligation.

Now, have you any thoughts as to what the Federal Government, through legislation here by this Congress, might consider doing to accomplish the things which you say are so necessary and which, I certainly agree that are vitally necessary.

We have got to make not only studying mathematics and science more attractive but the teaching of it more attractive at the elementary and secondary school level and so we can hold these teachers.

As you said, we are not doing it. What do you think that we, as the Congress of the United States, could or should do to accomplish that objective?

Dr. TELLER. As I have said, or tried to say before, Senator Bush; I think the diagnosis is relatively easy and the cure much more difficult.

I know that there are serious considerations whether or not one should go into it—to what extent the Federal Government should concern itself with local problems.

In a very naive and unsophisticated way, without knowing too much about the subject, I would imagine that the kind of legislation which will provide a subsidy for science teaching to be applied under local discretion but with a number of simple rules which will make the subsidy apply only in those cases which have some objective merit, I think such legislation, if drawn up as wisely as you would, probably would be of extremely great help.

However, it is not clear to me what the possible objections and the pitfalls of such legislation may be, and I would feel, I do feel already out of my depth by replying even in this tentative fashion to you.

FEDERAL AID

Senator BUSH. There are some things which the Federal Government does in the way of grants-in-aid to education at the elementary school level, as for instance the school-lunch program.

Now would you think that this was a serious enough matter that the Federal Government might say, well, we will deny assistance to any State which does not insist that the science teachers be given a 10-percent differential over and above what other teachers in the school get.

Is it serious enough to take drastic action like that which would be very unpopular, I am sure in many quarters?

Dr. TELLER. The situation is certainly serious enough. I would, of course, be happier if everybody's salary would be raised, but at the same time, it has to be stated that acute danger, the acute difficulty exists in the special case of the sciences, mathematics, but particularly the science teachers.

Now, I would think, therefore, that such a differential as you mention might be the necessary measure to take, and furthermore, the situation is made more difficult by the fact that as things stand now, I am afraid that a 10-percent differential is not enough.

Senator BUSH. Your feeling then is that whatever leverage the Federal Government might have in this field the situation is so serious as to deserve using that leverage right away?

Dr. TELLER. I certainly hope if such leverage can be made without causing some serious dislocation, I certainly hope that such leverage will be applied.

Senator BUSH. Thank you very much, Mr. Chairman.

Senator JOHNSON. Senator Barrett?

Senator BARRETT. Thank you, Mr. Chairman.

No further questions.

Senator JOHNSON. Any other members have any questions?

Senator FLANDERS. May I make an observation, Mr. Chairman?

TEACHERS' PAY

Senator JOHNSON. Senator Flanders.

Senator FLANDERS. This observation is for the record, and that is that there are high schools in my State of Vermont which are teaching dancing, which are teaching various other of these cultural subjects, which propose to teach skiing, which are teaching automobile driving with a master of arts degree, and I suggest that there is much that can be done on the local level to shift over the emphasis of these supernumerary subjects into basic education and raise the teachers' pay by applying future teachers to more basic subjects, raise the teachers' pay in the process.

ATOMIC ENERGY COMMISSION

Senator JOHNSON. Dr. Teller, I believe you testified that you are a member of the Advisory Committee of the Atomic Energy Commission?

Dr. TELLER. Yes, sir.

CUTBACKS—NUCLEAR ROCKETS AND AIRPLANES

Senator JOHNSON. As a member of the Advisory Committee of that Commission, are you aware of any of the Commission's cutbacks in the efforts to achieve a nuclear rocket and a nuclear-powered airplane?

Dr. TELLER. I know of the subject and the answer in any case would not be a completely simple one as we well realize.

I have the very strong feeling that I should not even attempt to sketch the situation in an open session, but if you require me to do so, I will try to do my best.

Senator JOHNSON. No. I should not want you to go into any matter that you could not go into fully within the bounds of the security rules, and if you feel that you have to violate security in order to answer my question, I will try to rephrase my question.

Dr. TELLER. I would perhaps answer this way: I have been a member of that committee for only a little bit more than a year. During this period some actions have been taken within the Atomic Energy Commission. Just to indicate my relation to these things, and without giving much of objective information, I should say that the conduct of these fields which you have mentioned, has been a wise one, and that—

Senator JOHNSON. Wise, did you say?

Dr. TELLER. Wise. And I would like to say that this is a difficult situation because one has to exercise judgment about the question; whether particular projects are feasible or not. I should also say that the situation as it exists now will certainly need reevaluation. But I do not believe that this need be done in these cases in my private opinion in any drastic fashion.

In other words, I think that if you would want to hear a discussion of these things in closed session I could furnish details and say more in detail what things have been done or not done. My general approach to it would be that I am in agreement, in general with what has been done, because among other things, our advice has been both solicited and by and large accepted. So if I would criticize, I would criticize my own recent judgment.

Senator JOHNSON. And if you were to elaborate in some detail you would probably justify the actions you have taken.

Dr. TELLER. Well, I am afraid that I have to admit that this is one possible way of looking at it.

Senator JOHNSON. Senator Carroll, would you have any questions you would like to ask Dr. Teller?

Senator Carroll, of Colorado, is here and I wanted to ask him if he had any questions.

Do you care to ask any?

Senator CARROLL. No, thank you, Mr. Chairman.

APPRECIATION

Senator JOHNSON. Thank you, Senator Carroll. We are delighted to have you and we hope you will be able to participate in these hearings. All other Senators are welcome.

If there are no other questions of Dr. Teller, I want to make a brief statement.

This committee is indebted to you but that is not so important as the fact that the entire Nation is indebted to you.

You came and told us what we wanted to know. You responded to our questions in the spirit of what should be done.

You laid the facts on the line, and you were careful to qualify your answers on the rare occasions when we wandered outside of your field.

I was particularly struck by one thought which you stressed heavily. It is that missiles will not be produced merely by issuing commands or giving orders, and that even if we could produce them by such means, we would not go to the root of our trouble.

As I understand it, it is your concept that what we need is a broad scientific base from which we can produce not only missiles but all of the weapons which modern technology is opening up to us.

It seems to me that this is a thought which must be pursued vigorously, not only by this committee but by all of the people of America.

Dr. Teller, it is a rare privilege to have the opportunity of hearing a man who is both deeply versed in his field and so capable of expressing his thoughts clearly and forcefully as you have done during the 4 hours of your testimony before this committee.

You have given us valuable information and you have given us thought-provoking ideas.

Our Nation, we all know, is confronted with a serious crisis. For the help you have given and for the contribution that you have made, we, and I mean the whole country, are very grateful to you.

We are mighty glad that you live in our country.

Thank you, Dr. Teller.

Dr. TELLER. Thank you very much, Senator Johnson.

Senator JOHNSON. Next is Dr. Bush.

Will you stand and raise your right hand, please?

Do you solemnly swear the testimony you will give this committee will be the whole truth, and nothing but the truth?

Dr. BUSH. I do.

TESTIMONY OF VANNEVAR BUSH

Senator JOHNSON. Every member of this committee is thoroughly aware of the tremendous contribution Dr. Bush has made to this Nation.

Dr. Bush is an outstanding scientist and outstanding American. I am not going to gild any lilies by paying tribute to Dr. Bush. But for the benefit of the record, I am going to make a very small reference to the contribution of Dr. Bush.

He received his bachelor of science and master of science from Tufts College in 1913 and his doctor of engineering from Massachusetts Institute of Technology and Harvard in 1916.

He has served with distinction in both business and academic fields. Until 1956 he was president of the Carnegie Institution of Washington. He is now chairman of the corporation of the Massachusetts Institute of Technology.

It would take many pages to list his service to our Government. He was Chairman of the National Advisory Committee for Aeronautics from 1939 to 1941. He was Chairman of the National Defense Research Committee in 1940-41. He was Director of the Office for Scientific Research and Development from 1941 to 1946.

He was Chairman of the Joint Committee on New Weapons and Equipment of the Joint Chiefs of Staff from 1942 to 1946. He was Chairman of the Joint Research and Development Board from 1946 to 1947.

He was Chairman of the Research and Development Board of the National Military Establishment from 1947 to 1948.

Dr. Bush, for many years Americans have been in the habit of turning to you for good advice and good counsel. It has been a wise habit, and we members of this committee turn to you once again in time of crisis.

I should like the country to know that when I called Dr. Bush at his home, he agreed to come and give freely of his time, and to counsel this committee in any manner we desire.

We are grateful to you, doctor, for being here. And, counsel, will you proceed with questions?

And if it is agreeable to you, doctor, we will let the photographers proceed for the next few minutes.

Dr. BUSH. They won't bother me at all.

Senator JOHNSON. And, Counsel, you proceed with your questions.

Mr. WEISL. Dr. Bush, we are very fortunate that you have the great advantage of being not only an eminent scientist and a distinguished educator, but an experienced administrator in business, in peace and in war.

You heard the testimony of Dr. Teller, and you have heard the questions asked. We started out by discussing the sputnik.

Would you add or like to add anything to what was said in that connection?

UNITED STATES VERSUS SOVIET PERFORMANCE

Dr. BUSH. Dr. Teller's exposition on that was so complete that I don't think there is anything that I can add.

We know that the Russians have now exceeded our performance in that area, that they have put into an orbit a projectile weighing half a ton while we have thrown a few particles into outer space.

It has been a great shock to the country thus to learn that in a field where we thought we were doing well, we have been exceeded by their performance.

Mr. WEISL. Would you like to add anything else to what has been stated about the ballistic missile which projected a half-ton satellite in an orbit?

Dr. BUSH. I would restate what Dr. Teller said in some other words

PROBLEMS OF SATELLITE AND BALLISTIC MISSILE

The problems underlying the sputnik and underlying the ballistic missile are very similar. In the case of the satellite, it was necessary to get a very high velocity of the body and to guide it sufficiently well to bring it into an orbit.

In making an intercontinental missile, it is necessary to do both of those things, but to do the second one very much better and, in addition, to solve the reentry problem into the atmosphere.

I think another word can be said on this matter of the precision. In order to put such a missile into an orbit above the earth, a precision of perhaps 1 degree in guidance is sufficient.

In the days when we considered only the A-bomb as a warhead, if the missile were to be of really practical use, it would have been necessary to increase that precision by a factor of 100.

With the advent of the hydrogen bomb, however, the problem became very much easier if that was the warhead, and a precision of 10 times that necessary for the precision of a sputnik would have sufficed.

I think that had a great influence on that whole development, because that guidance problem is an exceedingly difficult one. It means to take a body traveling at very high velocities of the order of 18,000 miles an hour, and to guide it during the first few miles of its flight,

while it is being accelerated through the air, with such precision that it can be brought to earth at a chosen point thousands of miles away.

I am quite frank to say that when this work began soon after the war, I was exceedingly skeptical whether that very tough problem could be solved.

It has apparently been solved. Whether it has now been solved with sufficient precision by the Russians, I do not know; but I agree with Dr. Teller if they have not solved it, from their progress in other ways we should expect them to solve it soon.

Mr. WEISL. That faces us, as the Senators indicated by their questions, with a very serious challenge.

Dr. BUSH. It does, sir.

Mr. WEISL. Based upon your experience as an administrator in two wars, and your exposure to the problems of administration in the war effort, could you in your own words state to the committee what you would do to expedite the program of defending our country in the best possible and most effective manner?

ALL-OUT WAR, ITS EFFECTS

Dr. BUSH. Before I answer that, sir, may I say a word on just what I think the threat is, because I think there is a word to be added there before we have the picture completely before us.

Mr. WEISL. Yes, sir.

Dr. BUSH. It is a grim enough world if two countries face each other with such weapons that, if all-out war broke out, both countries would be completely demolished. That certainly is grim enough.

But we feel that under those circumstances, all-out war would probably not break out, because no man would deliberately throw us into that sort of a holocaust where he and everything else would be destroyed. It would break out perhaps by accident or possibly by desperation, but it would not be brought about deliberately.

But that is a grim situation.

But it would be a far more grim situation if we faced a situation in which the enemy could devastate us and we could not reply. We must never let that condition come about, because that would be altogether too inviting for those who reside in the Kremlin.

So this is far more than merely a problem of an advance in weapons. This country now faces definitely a situation where it must prevent at all costs being in the position where it can be overcome without the possibility of answering.

WHAT SHOULD BE DONE

Mr. WEISL. What do you suggest, Dr. Bush, that we do?

Dr. BUSH. The answer can be broken down into several parts. There is the long-range problem, and there is the short-range problem, and there is also the immediate problem.

Turning to the last one first, Dr. Teller has already said, and I would repeat, that the first priority is to be sure that we do not get in that condition, by utilizing properly the means already at our command.

We must be sure that SAC, on which our dependence rests, cannot be put out of action by a single salvo when the Russians have the intercontinental missiles to use in that manner.

That, I think, is the most important and immediate thing that needs to be done.

Second, we need to accelerate, we need to extend our guided-missiles program, to see that it goes forward at the greatest possible speed and effectiveness.

In that connection, I feel that there is nothing wrong with American scientists or with American engineers, or with American production men, for that matter.

Our difficulties are three, as I see them: First, organization; second, planning.

COMPLACENCY

And third, this very important and underlying situation which is at the basis of all of our present troubles—the fact that we have been complacent, and we have been smug.

When I say “we,” Mr. Chairman, I include myself. We all of us in this country have had a rude surprise. Now that we have had the surprise, I am far more optimistic than before the sputnik influence, because I have every confidence that the American people, now aroused, will move forward effectively. But we have had a rude awakening, and the first thing for us to do, the country as a whole, is to divest ourselves of our smugness and complacency and get to work.

Mr. WEISL. How do you suggest we get to work? How do we put first things first, in your opinion?

Dr. BUSH. Well, I have already spoken of the thing that I believe comes first.

Mr. WEISL. You mentioned SAC.

Dr. BUSH. And the second thing I would say would be this: I believe that we need to put our house in order on our missiles program as far as organization is concerned.

I would agree that it is far too late in the game to do this by cutting out this missile or that missile; the sacrifice would be too great.

AROUND-THE-CLOCK AFFAIR

But we need to be sure that the program from here on move smoothly and effectively at maximum speed. It must not lag because we have a 5-day week somewhere where it should be an around-the-clock affair.

It must not lag because of contests between services, which have been damaging in the past and which sometimes, in my opinion, have been disgraceful.

We must not let it lag because of any absence of interchange between participants, and we must be, as far as possible, sure that the men who are doing the work in the laboratories and in the industries are given a simple framework within which to work where they know who is responsible and can get their authorizations promptly and effectively without attempting to go through a complex maze of government.

I put this as the second thing to do. We need to put our organizational house in order.

UNIFICATION ACT

Now, for a third thing, and this will take more time, the reason that we are in a tangle on this program, in my opinion, is because of the absence of overall planning. Many years ago the Unification Act was passed by the Congress of the United States, the primary objective of which was to bring about unified war plans, unified programs for the development of our weapons, and for their utilization.

That Unification Act has never worked for its intended purpose.

And the next thing I would recommend to you gentlemen most seriously is that you put our unification law in order so that we can have in this country unified central military planning that transcends the interest of any particular service, that will give us the best possible utilization of our facilities and our manpower, to the end of putting us ahead again in the race.

And I say to you, if that is done, then many of the difficulties that we now face will disappear; and in particular, we will see the end of interservice contests, of which to my mind we should have seen the end long ago.

Mr. WEISL. Dr. Bush, in what respect has the Unification Act failed to work?

Dr. BUSH. The primary objective of the Unification Act was to prepare unitary plans, and for that purpose the Joint Chiefs of Staff were charged with the duty of preparing unified war plans, unified programs.

They have never done so.

PROBLEMS OF THE JOINT CHIEFS OF STAFF

I have had a great many friends on the Joint Chiefs of Staff, and I have sympathized thoroughly with their predicament. I think the difficulty has never resided in the individuals. I think the difficulty has always resided in the form of the organization that was set up. You cannot expect a man to be a forceful leader of a service, the commanding general responsible for keeping the morale of that service at a high pitch, responsible for seeing that that service is at the peak of effectiveness, and at the same time expect that man to sit down with 2 others, forget all of his service responsibilities, and plan actions from a national standpoint for all 3 services.

And the Joint Chiefs of Staff have never done that. They could not have been expected to do so, and they haven't.

INTERSERVICE RIVALRY

Mr. WEISL. You spoke of interservice rivalry. How would you eliminate that if it does exist?

Dr. BUSH. Exactly the way I have just stated. I have worked with military men for many years, and I admire the military point of view greatly. You can be sure of one thing: When a military man has a clear order delivered to him by an individual that he knows has the authority to issue that order, he will follow his orders; there is no doubt about that.

You can also be sure of this: When a program of development, of strategy, a war plan has been adopted by a properly constituted professional military body, which has the authority to carry out that

plan when it has been approved by its Commander in Chief, he will give loyalty to that program even though it contradicts some of the things that he previously believed.

The principal reason we have had service rivalries is because there has been no umpire in court.

The services themselves, the three services, have prepared war plans, all different, each one of them the best they can produce. From there on, there has been no means by which those could be brought into a unitary plan.

And since there has been no such means, the 3 plans have been advocated by the 3 services, and the discussion of them has been in the public press, and some of the decisions in regard to them have had to be made right here on Capitol Hill.

CENTRAL PLANNING BOARD

That, gentlemen, is not the way to prepare for war.

If we had an effective, central planning body acting as a staff to our Commander in Chief, digesting all of these things, putting them into their relative framework, and out of it producing a program for the country, that program, when approved by the Commander in Chief, would, in my opinion, have the loyalty of every service, and the bickering would stop.

Mr. WEISL. How would that central planning board work in the production of missiles?

Dr. BUSH. What is that?

Mr. WEISL. How would that central planning, war planning board, work in connection with the production of missiles, for instance?

Dr. BUSH. As I said a moment ago, I think that the time is past for that kind of planning on the missiles program. We are in the middle of that. It is under full tilt everywhere. We should not now stop and say "Let's do this in an ideal way."

The thing to do with our missiles program is to start from here with the conditions we now have, and to proceed to make the best of it that we can.

What I am talking about is something that may have its effect 5 years from now. Let's start now to see that we have unitary planning so that when the next thing comes up, it will be in order from the outset.

Mr. WEISL. Dr. Bush, have you suggested this plan in the past?

Dr. BUSH. Oh, yes. I have had a number of arguments with the Joint Chiefs of Staff in regard to it. I think probably if you were to call some of the old Joint Chiefs to the stand, you would hear about those in an interesting way.

ROCKEFELLER REPORT

But one time it came up very strongly. Four years ago the Rockefeller Board struggled with this matter. They did not go nearly as far as I had hoped they would, but they went a long distance in advocating changes which would improve the situation.

They, in fact, advocated taking the primary job of planning out of the hands of the Joint Chiefs themselves. That recommendation was seconded by every member of the committee, which included Mr.

Lovett, General Bradley. It was not objected to by the military advisers, Marshall, Nimitz, Spaatz. It was approved by Mr. Wilson and Mr. Kyes. The President of the United States seemed to like the report. That particular thing has never been put into effect.

Mr. WEISL. What happened to it?

Dr. BUSH. I do not know. I asked the Secretary of Defense a year ago, and I do not think he knew.

FREE SOCIETY SCIENCE VERSUS COMMUNIST

Mr. WEISL. As Dr. Teller was testifying about the great advances made in science in Russia, the thought went through my mind as to how science can flourish in a Communist society. We have always been told that science can only flourish in a free society. How do you account for that, Dr. Bush?

Dr. BUSH. I said a minute ago that, when I said we had been too smug in this country and too complacent, I included myself. I will give you the reason for that. I have learned something. When the war ended, in the few years after the war, I felt strongly that we had no fear of Russia, that we need have no fear of their progress in science or its application to military matters, for at that time the Russian laboratories and Russian science were dominated by the party members, by the commissars, really by fourth-level political hacks who sat in the laboratories and dictated their every move, who told the scientists not only what they would do but what they would believe.

And I felt that any country that puts its science under that type of control would certainly be no competitor in the type of race that lay ahead of us. But Russia changed that, and some 8 years ago she turned her scientific people free, and today a Russian laboratory is no more dominated politically than is a laboratory in this country.

And, as you will hear from Dr. Chipman, the scientists in that laboratory determine their own program. There is no interference from the political side, from the commissars, with what they do or what they think. When they thus gave freedom to their scientists, they became good competitors.

In that respect, you can say that they copied us. I merely hope that, if that is true, they will copy us in every other aspect of freedom. If they do, we need have no more fear. That will take time.

LONG-RANGE OUTLOOK

Mr. WEISL. You spoke, Dr. Bush, of the long-range plan that we should adopt to defend our security and protect our leadership in the fields of science and technology. Do you wish to comment on that?

Dr. BUSH. That is a very large subject, and one that I could comment on at great length. It goes, of course, back into all of the questions of our education. It also goes back to the thing that Dr. Teller has emphasized so well, the attitude of the country as a whole.

COMPLACENCY

We have had a strange way in this country, in our prosperity. Our standard of living has been very high; we have had a democratic country where the standard of living has been high, not for the

chosen few, but for everyone, and out of that has come a complacency, an egotism, in which we have felt that we were so good that we need not worry about anything else that happened in the world while we went our own sweet way.

We have increased that feeling in many ways. We continually tell ourselves how good we are. In every magazine that you pick up today you will find a set of advertisements, and every one of them will tell you how good this particular company is in the guided-missile field, or wherever they may be operating.

We believe it, and we have our services in their appearances before you gentlemen when they are looking for funds, also telling us how good they are. I hope they are as good as they think they are, but they tell us, in any case. So, we have gradually in this country come to the point where we have become very convinced that we are awfully good.

EDUCATION

Now, out of that has come many difficulties, and, in our educational system in particular, we have been taking the easy way. If a youngster wants to go to school and study science, well, they will let him. But if he would prefer to study something that is much easier and sweeter and less demanding, they let him do that, too, and that is because we have been complacent.

WAKE UP

And I think the primary thing that needs to happen to us here in this country is that we wake up to the fact that we are in a tough, competitive race where we have got to do a lot of good, tough work, and that that begins just as soon as the youngster goes to school. And we have got to expect him to struggle with tough subjects, so that, out of the great group of youngsters, there may be selected and trained those scientists, those engineers of the future that we must depend on for our continuing security.

That is first and foremost; that we change our whole attitude toward this subject. Then, having changed that attitude, there are many things we could turn to.

BASIC AND APPLIED RESEARCH

Mr. WEISL. Have you any suggestions to make on how we can expedite basic and applied research in this country, which is so vital to our defense?

Dr. BUSH. The two things are very much tied together, of course, and, as Dr. Teller has said most effectively, a scientist works well when he is playing to an audience.

Now, extending that a little further, our scientists in this country will perform to a far better degree, then, when they feel that the general public, the men of intelligence, are behind them, that everyone in this country appreciates the risks that we run, the necessity for having our science right on its toes, the necessity for progress in every field.

When that atmosphere obtains, the scientists will work better, and there will be more of them, because youngsters will flock into that field.

Let me say that the scientists, and I have known many of them—and let me say, incidentally, I am no nuclear scientist. I wish the press would note that, and quit calling me one. In fact, I am not a scientist at all, but an engineer working around the edges of science, but I have dealt with scientists in various ways.

HIGHER SALARIES NOT PRIMARY INTEREST

It is said they should be paid higher salaries and given greater honors. Yes; well and good. But your scientist is not dependent on that, and, in general, if he can do his work and if he has got the freedom to do it, he will be happy. If he is paid well, well and good. But that is not the primary interest that he has in mind.

Honor, yes. What he wants more than anything else is the respect of his peers, the respect of his fellow scientists. And, beyond that, he wants to feel that he is working in an area where the public about him, the businessmen, the men that he meets casually, think of him as a fellow worker for the good of the country, and not as a highbrow or egghead that is off somewhere on a pedestal and not to be approached.

CHANGE IN ATTITUDE

Mr. WEISL. Dr. Bush, how can this committee or the Congress help in some way to bring that change of attitude about or implement it in any way?

Dr. BUSH. Well, you are doing a great deal by this set of hearings, and I hope you will keep them up. The sputnik was one of the finest things that Russia ever did for us. I am very glad they fired the thing off. It has waked this country up. There has not been an awakening like this, I was going to say since the days of prohibition, but let me say [laughter] since the days of Pearl Harbor.

We have had a real awakening in this country. I just hope we do not begin to forget about it, and in a little while slack back to our easygoing ways. We have had an awakening, and we have had a scare. Let's keep the talk going. Let's be sure that we in this country do not forget that we now know we are in a tough race with a tough antagonist where there will be no mercy if we lose.

Mr. WEISL. Dr. Bush, if there is anything I have failed to ask on any subjects that you would like to present, I wish you would present it.

Dr. BUSH. I think of nothing offhand, sir.

Mr. WEISL. Thank you very much. That is all I have to ask, Mr. Chairman.

UNIFIED PLANNING BOARD

Senator JOHNSON. Dr. Bush, you placed a great emphasis in your testimony on the need for truly unified war planning in our Defense Establishment.

Dr. BUSH. Yes, sir.

Senator JOHNSON. Now, your proposal seems to require legislative action. I should like to ask you whether you believe there are any effective ways of dealing with the war-planning problem without action by Congress.

Dr. BUSH. I think it could be done without action by Congress, but I think it can be done a lot better if you gentlemen will take a hard

look at the Unification Act and will modify it with the experience of the past 10 years in mind, and with the object of putting in there as the central feature, exact provision for unitary planning so that we will be sure to get it.

HOW BOARD SHOULD WORK

Senator JOHNSON. Doctor, will you spell out in some detail how your planning board would work?

Dr. BUSH. I have already said that it is not fair——

Senator JOHNSON. Not what?

Dr. BUSH. Not fair, not reasonable, to ask the Joint Chiefs of Staff to do this central planning, to be at the same time commanding generals, commanding admirals, and sit down as a staff to the Commander in Chief to work out the unitary plan. It is just against human nature.

CHANGE JOINT CHIEFS OF STAFF

I would put the preparation of that plan into the hands of three men as eminent, of as high rank, as distinguished as the Joint Chiefs, detached from all further service to their individual services, on their last assignment before retirement, if necessary.

I would bring back retired officers for the purpose, if I found just the right men there.

I would pick those officers as men who have demonstrated beyond peradventure that they can rise above service interest when so ordered by the Commander in Chief, and do their planning on the basis merely of what is the best effective plan for the country.

I would support that group of men by giving them the opportunity to pick throughout the services the brightest captains and colonels that they can find for service with them. I would support them also by giving them the authority to bring in with them civilian scientists, civilian professional men, other types, in any way that they could use their work most effectively, and I would provide that when they made a recommendation, it would go to the Secretary of Defense and the President.

I would let it go through the Joint Chiefs of Staff in order that they might make comment on it, but I would not give the Joint Chiefs of Staff any authority to hold it up or to alter it.

Senator JOHNSON. Do you believe a program of that kind would prevent repetitions of our present missile situation?

Dr. BUSH. I think it would, sir.

Now let me say that while you asked for specific form, and I gave you one, I hold no brief for that particular one. If someone can produce a better one, I will be all for it.

The essential thing is that in one way or another we get the thing we are looking for, namely, a unified war plan.

ROLES AND MISSIONS

Senator JOHNSON. Doctor, in your opinion, in the light of the modern developments in weapons systems, will it be possible to achieve maximum military effectiveness while maintaining the existing divisions of roles and missions between the three services?

Dr. BUSH. Well, let me answer that in two parts.

I would not favor merging the three services into a single service in the same uniform, by any manner of means. One of the greatest assets we have in this country is the tradition, the esprit de corps, the pride of the three services, and that we must preserve. That is not an asset to be thrown apart lightly.

SINGLE CLEAR AUTHORITY

But I do know this: That when we have had the 3 services under a single commander in the field, in Germany, in the last war, in the Far East, in Korea, when we had the lines of authority clear, and the 3 services present, we have had proper collaboration and joint action between them. We have had proper handling of their three facilities.

I would like to see that produced on a national scale for planning as well as for field operations.

For that purpose, I think that it is not necessary to merge the three services into a single uniform, and I think it would be a mistake to do so.

Senator JOHNSON. You heard Dr. Teller's testimony, and you heard his five-point program.

Dr. BUSH. Yes.

Senator JOHNSON. Do you generally agree with that list of priorities?

Dr. BUSH. Yes.

CIVILIAN DEFENSE

There is one thing I would say in that connection. On this civilian defense affair, and on the shelter matter, I am still in the position of the gentlemen from Missouri. I want to be shown.

It is exceedingly important. It should be examined with great care. But I have this feeling in my mind. Let me go back just a moment, if I may. If there had never been an A-bomb, if there had never been the harnessing of nuclear energy for war purposes, we would today find ourselves in the kind of a world in which we now stand. The difference would be that we would be terrified by chemical and biological warfare instead of atomic warfare.

The war of the future may not be exactly what we think it would be. Suppose we made provision against fallout, suppose we made provision by shelters against H-bombs. I am not sure that those could not be overcome, if there were a chemical or a biological war-head, and I would like to see that examined with great care before we launch on a program.

If it can stand that analysis, by all means let us do it, provided we do not fall into a Maginot-line complex, and emphasize the defense at the same time that we neglect the offense, because our safety lies primarily in having such a strong offense that no one will ever dare to challenge us.

Senator JOHNSON. As I recall it, that was exactly what Dr. Teller recommended that we take a look at.

Dr. BUSH. Yes.

Senator JOHNSON. I quote, "take a look at our passive defense system," and that you would then say that in general you are in agreement with the five-point priority system that he recommended.

Dr. BUSH. I think I would put them in a little different order but they are certainly all very important.

CATCHING THE SOVIETS MEANS SACRIFICES

Senator JOHNSON. Now, finally, I realize we have men who are somewhat bolder than others, and some who want to go a little further, a little faster than others, but I have a letter here sent to me through Senator Green from Professor Probst, who has been a consultant on 2 United States ballistic missiles for several years, and I have just read 1 or 2 paragraphs of it.

The letter was delivered to me since we started the hearing this afternoon. I want to read you a paragraph or two from that letter and have your comment.

If we are to catch up with the U. S. S. R., and I believe this may take as long as 10 years, then we must face up to the fact that our present defense budget will probably have to be doubled. In terms of annual gross national product, this is not large, but would nevertheless mean a reduction to some extent in the present standard of living for all America.

In spite of the complacency of America, it is therefore necessary for every individual to realize that we are at war, and such a state requires corresponding sacrifices. The cries for leadership and individual sacrifice for this may be the last chance of the West. The question then is whether we shall meet the challenge of who shall be in the vanguard of the sputnik era.

There is an article entitled "Space Flight and Security." It is an article that is to be published in the Canadian Forum. It was written by Dr. Probst, who is an associate professor of engineering at Rhode Island University. I should like to have your comments.

MONEY NOT THE ONLY FACTOR

Dr. BUSH. In the first place, you do not get results by simply pouring in money. If you put 10 times as much money into basic research today, you would not have 10 times as many scientists.

On the other hand, there are some things that today call for more funds without doubt. We need to give greater support to basic science in this country than we ever had, and it is about time we began to do it on a proper scale, but that does not call for great funds.

We can use more funds, I am sure, in our guided-missiles program, in our intercontinental-missiles program, and wherever additional funds can be used effectively, by all means let us make them available.

So, I see our expenditures going up for a bit, certainly. But I would also say to you this: That if we had really integrated central planning in this country for years ahead, to get the emphasis on the most important things and to be sure that that emphasis is sufficiently intense, we will at the same time find, I am sure, many ways in which money can be saved, so that in the long run over a period of many years I am not sure that our military expenditure needs to go up enormously. I am sure it has to go up for the moment, and for perhaps 5 years. Then I would like to see a thorough study made first to see what can be done in the other direction.

Senator JOHNSON. So in conclusion, Dr. Bush, you not only would join Dr. Teller in his five-point recommendation, but you would probably put at the head of the list, a redrafting of the Unification Act that would bring about truly unified war planning, and that is the substance of your testimony?

.. Dr. BUSH. At the head of the list, I would put vigorous action in every way to be sure that we do not let ourselves get in the position where we can be attacked suddenly and put out of business by a single salvo, and that certainly means at the present time attention to SAC, to be sure that its dispersal is correct, that its readiness is correct, so that it cannot be thus destroyed.

We must also plan in this manner continuously, and that planning should now go on.

For example, we talk about intermediate-range missiles. We must not get into the situation, gentlemen, where we have missiles and the enemy have missiles, and he knows where ours are and we do not know where his are.

That must also have immediate attention to guide our program appropriately. These things come at once.

I say also that there is a second thing. I would put our organizational house in order in regard to the handling of the missile program, and so forth.

And third on the list, I would recommend to you gentlemen that you take a look at the Unification Act and bring that up to date, and incidentally, while you are doing that I hope you will also take a look at the Atomic Energy Act and be sure that our interchange with our allies is not unduly hampered.

Senator JOHNSON. Senator Saltonstall?

Senator SALTONSTALL. Thank you, Mr. Chairman.

Dr. Bush, I think Senator Johnson asked the questions I had in mind on the Unification Act.

FEAR OF GERMAN TYPE STAFF

You and I have discussed that several times, but I do have one further question.

Do you favor one Chief of Staff?

Dr. BUSH. Well, may I make rather an extended answer to that, because that brings in a very interesting question.

At the time that the Unification Act was passed the Congress of the United States was quite properly afraid of the idea of something paralleling the German Central Staff, and they were also very much afraid of a general staff that would take command, and the talk about a single chief of staff, revolved about those ideas.

Now if a chief of staff could take command then a single chief of staff would be a mistake for this country, I am sure, for our Commander in Chief in this country is a civilian, the President of the United States, and we don't want to change that.

If on the other hand the Joint Chiefs of Staff are a planning agency, an advisory agency and not a commanding agency, then I don't care whether you have a single chief of staff that is the chairman, or whether you rotate it, or what you do, so long as that body sticks to its business and does the planning that we need.

There has been a good deal of criticism of the German General Staff.

True, it lost the first battle of the Marne by interfering with the armies in the field, but that was because it took command of the field armies.

It ceased to be a staff, and it became a commanding committee, than which there is nothing worse in military control.

Now our Joint Chiefs of Staff once took control and began to be in a position of giving orders, and controlling the forces in the field. The Rockefeller Board tackled that and it ceased at that time.

We have not since had our Joint Chiefs of Staff in a position where they were a commanding committee.

The Joint Chiefs of Staff, or some body made up similarly to theirs, should be a planning agency only and not a commanding agency, and this question of a single Chief of Staff revolves about the question of command, and on that I would say quite forcibly let the command proceed as it does now, through the military channels to the President of the United States as Commander in Chief, and through the civilian structure that surrounds him.

Senator SALTONSTALL. So the essential thing is the planning done under a civilian Commander in Chief and his assistant, the Secretary of Defense.

Dr. BUSH. That is right, sir, and if we have an Army in the field, let the commander of that Army be appointed by the President of the United States on the recommendation of his military staff, and when that man is appointed and in the field let him not be interfered with by Washington in the proper discharge of his duties.

Senator SALTONSTALL. As I understood your testimony, you said on the missile program that competition between the services had been going on, but that the development had gone so far that you would not necessarily eliminate any weapons that were now being worked on.

Your testimony on that was similar to Dr. Teller's?

Dr. BUSH. Yes; I am not a missiles expert of course, but the point I wanted to make, Senator, was this: That I feel it is too late in the day to cut out some of these things.

If you cut out competitive things early it costs you very little. But if you let a thing go to the extent that some of these things have gone and then cut them out you make a great sacrifice.

I would leave this to the judgment of the people handling the program and merely wish to say from my standpoint I would like to emphasize that it is pretty late in the day to do severe cutting.

Senator SALTONSTALL. If my memory is right, you were at one time the chairman or a member of the Research Commission which was originally established under the Unification Act, were you not?

Dr. BUSH. Yes, I was Chairman of the Research and Development Board.

Senator SALTONSTALL. And then that was changed to an Assistant Secretary?

Dr. BUSH. That is right.

Senator SALTONSTALL. And the Commission was cut out?

Dr. BUSH. About 4 years ago.

Senator SALTONSTALL. The Research Secretary up to the present time certainly has not had sufficient authority, in my opinion. Do you believe that Mr. Holaday, who is in the position today of director of missile effort in the Secretary of Defense's office, has enough power?

Dr. BUSH. Well, I really don't know, of course, but I do know this: that I feel perfectly certain that the Secretary of Defense has the power and can put this matter into order.

If there are any obstacles in his way I hope you gentlemen will remove them but I don't believe there are.

How he does it, I would leave to his judgment, and I have great confidence in him.

What he has done, I understand is to name Mr. Holaday, reporting directly to him, to handle the affair. He has all the authority, McElroy has. What he proposes to delegate, I don't know. But I judge quite thoroughly for that purpose.

Just one more point on that, Senator, you speak of this being a research and development program. It is also a production program today and will be, and those two things are quite different.

I know we have sinned in the past and I think we are still sinning in this regard. We have at times had our research and development under our production people, under our procurement people.

Now, industry learned long ago if you put the research department under the production department you get nothing, because the job of the research department is to make life tough for the producers, and when you put the research under the producing group, you get nowhere.

We have still that situation in our own missile program in spots, and one thing that I think needs to be straightened out is to be sure that the research reports as research right clear to the top, and production reports separately, so that we don't get one subordinate to the other.

But how that is to be done, I don't know. I feel it is in competent hands.

Senator SALTONSTALL. In other words, what you believe is that the top research man, whether it be an Assistant Secretary of Defense or whoever, should be free from the problems of production.

Dr. BUSH. Free from the control of production.

Senator SALTONSTALL. Yes.

Dr. BUSH. Because if you take a research man and put him under a production man, you won't get any research that amounts to anything.

If you put him under the sales department you will just get monstrosities.

Senator SALTONSTALL. Let me ask you one more question:

You talked a number of times about, if I remember correctly, the possibility of the Federal Government stimulating science through some form of scholarships.

Am I correct in that?

Dr. BUSH. Yes, and I was very glad, when the National Science Foundation was established, that you gentlemen included a provision for scholarships, fellowships, which has gone very well.

Senator SALTONSTALL. In your opinion that program is working out well?

Dr. BUSH. I think it is, although I don't think we have gone nearly far enough in that regard yet.

ON LOOKOUT FOR BUDDING SCIENTISTS

In Russia I understand that a very careful search is made throughout the entire country to find early those youngsters who have scientific talent or the promise of it, and then with that promise they are subsidized all the way through their studies, if they can go that far with benefit to the state.

We still have a situation in this country where young men of great talent are stopped from getting all of the education they need for financial reasons.

We ought to get beyond that. We have made great progress with fellowship programs, the universities with their scholarships, and so forth, but we should not stop any youngster in this country of real scientific ability from getting all of the education he can get, at public expense if necessary, for our benefit as a country as a whole, not for his benefit but for ours, and let me add just one more thing:

In Russia he is given examinations from time to time and when he flunks them he goes into the Army. In this country, we put him in the Army anyway. Now that may be all right; provided the services continue his education effectively.

But we cannot afford to interrupt the man's progress toward a career as an engineer or a scientist by that manner or any other manner in this crisis.

Senator SALTONSTALL. Then what you say is we don't need a change in the law with respect to the scholarships for science?

All we need to consider is how much money we want to put into the National Science Foundation for that purpose.

Dr. BUSH. No; I think you want to examine, Senator, ways of subsidizing youngsters.

Senator SALTONSTALL. Thank you very much.

Dr. BUSH. And by all means when you do it, if you will subsidize it in such a way that it does not place an additional burden on the university I think that would be a good idea too.

Senator JOHNSON. Before I go to the next questioner, I want to ask Dr. Bush if he would tell the committee how he feels the missile program would have developed if his planning had been in effect.

Dr. BUSH. Well, I think for one thing we would have had fewer missiles and more concentration on the ones that we have. I think we might have had competition earlier between groups of scientists in the days when experimentation was relatively inexpensive.

But I feel when we came to hardware, which is exceedingly expensive, that by that time missiles for a particular purpose would have been merged so that we would have had 1 program and not 2 or 3.

I believe that in many other ways we would have had a program that would have made a great deal more sense and a great deal more speed.

Senator JOHNSON. Doctor, don't we have a planning agency in the National Security Council?

Dr. BUSH. Well, the National Security Council, Mr. Chairman, as I understand it, and you gentlemen know more about this than I do, is the place where Treasury and State and Defense meet, and is an advisory body to the President, where national policies are being formulated on many things.

And I assume that it is their function to bring together these elements, and I don't understand that it is their function to do military planning.

MILITARY PLANNING BY THE MILITARY

In fact I would not want to have my military planning done by a group of financial men, or by members of the State Department; I'd feel about as secure if I went into a hospital for an operation and had the diagnosis made by a group of lawyers.

I think we want to keep our military planning in military hands. I don't think we want to do our military planning by using civilian

bodies except for advice. I think we want to have our military so they will use every bit of civilian assistance that they can possibly use effectively, so that they will not be afraid or reluctant to bring in outstanding specialists in any field, and to listen to them and to work with them.

But I think the primary responsibility for military planning should rest on the man in uniform who devotes his life to that very thing.

Senator JOHNSON. So you don't have a very high regard for the National Security Council as a planning agency?

Dr. BUSH. I have a very high regard for them.

Senator JOHNSON. As a planning agency, I said.

Dr. BUSH. Oh, yes; as a planning agency I have great regard for them.

But as a planning agency in the field of general military policy where our military posture and our military possibilities are joined with the questions that come up from the State Department in regard to foreign relations, to bring about a joint affair that can be properly called overall national policy.

Senator JOHNSON. Don't the recommendations of the Joint Chiefs go to the National Security Council?

Dr. BUSH. They are supposed to. In fact, I think the theory is that the Joint Chiefs of Staff will keep the Security Council informed as to the military aspects of any problem that they may meet.

Senator JOHNSON. Senator Kefauver?

Senator KEFAUVER. Dr. Bush, you have had a great deal of organizational experience in Government and in our Defense Establishment so I wanted to ask you this question.

We all realize that the immediate matter is a military one, to get our missile and satellite programs going, but in the long pull that involves many important civilian aspects, education, scholarships, basic research. I feel all of those things should be coordinated under one civilian control.

That is the trouble with the present setup, it is that while Mr. McElroy is head of the Defense Establishment, maybe a very competent man and he will do what is necessary for defense, that he would not have the knowledge of or be interested in National Science Foundation or scholarships or application of these things to civilian purposes.

Don't you feel that we should have—and I join some of my colleagues in advocating a Secretary of Science which when established would have all these things under him?

Don't you feel that while it might not be possible to unscramble some eggs that are already scrambled, on the basis of getting this overall program done that we ought to look forward to and work toward getting our satellite, our missile, our research, our scientific education and so forth under a civilian cabinet, a Secretary who would have authority to speak with equal authority to the Secretary of Defense.

Dr. BUSH. I have struggled with that problem, Senator, for quite a while, and I am still confused.

Senator KEFAUVER. Would you mind stating your best thinking about it?

Dr. BUSH. My best thinking today is this: science is found in every department. It is an ingredient of everything we do today. If we made a Department of Science and removed all the science bureaus

from the various other departments and put them in that place, I am sure it would not work.

The Bureau of Mines cannot work outside of the Department of Commerce.

You cannot have agricultural research over here, and the Department of Agriculture over there.

I am sure that it would not work to try to gather all of the governmental science that there is into one place, and I am afraid that if you created a Department of Science and put in it only one or two incidentals, that the fellow who headed the Department would feel pretty lost with the great bulk of science going on elsewhere, in the Department of Defense and in the other departments.

Rather I would say this: Science permeates all of our affairs. It is not a thing that can be isolated and placed over by itself.

I hope that we will have many members of the Cabinet who have perhaps not been themselves scientists, or engineers or the like, but who understand scientists and are sympathetic toward them. I think everything we do must be done in the light of the advance of science but I am not too sure that it would help that along to suddenly create a Department of Science.

SEES NO NEED FOR CHANGE IN LAW

Senator KEFAUVER. Dr. Bush, our present setup, I believe, is that the Secretary of Defense, Mr. McElroy, is the so-called missiles czar. He has taken over the direction of all of the activities of the services. The President has a very able man in Dr. Killian as a personal special adviser.

Is that the kind of setup where you can get coordination and the best results in your opinion?

Dr. BUSH. Certainly, the Secretary of Defense has all of the authority that is necessary to bring about coordination that we are looking for, if he exercises it.

I hope and trust that when he does exercise it, if there is some service that is not satisfied that the decision on the matter will be made behind closed doors and after proper evidence and proper consideration and not by argument in the public press.

But if the Secretary of Defense is a determined man, and intends to bring his house into order, and if he is thoroughly supported in doing so on Capitol Hill, and elsewhere, the job can be done without any further law, I feel sure.

Senator KEFAUVER. What did you say, Dr. Bush, would be the ideal executive setup for the best possible efficiency in this program and the best possible coordination of the various efforts?

Dr. BUSH. I don't know, sir. I can't answer that question. It is an exceedingly complicated affair, and we are now in the position where we must go on, we cannot stop and create an ideal form, an ideal situation.

We have to do with what we have and get on with the job, and I am not enough acquainted with the details to know where I would move if I suddenly had that responsibility.

I am very glad that I do not.

Senator KEFAUVER. Mr. Chairman, I wonder if I could ask if Dr. Bush would think the matter over and if he has any thoughts

about the organizational setup to communicate with the chairman of the committee?

Dr. BUSH. If I see a solution, Senator, you will have it at once.

Senator KEFAUVER. I hope you find one, Dr. Bush.

Thank you very much

Senator Stennis (presiding). Senator Flanders.

Senator FLANDERS. Dr. Bush, I was interested in the suggestion you made as to the nature of the military planning board.

It would be a simple job perhaps if we had one, but it is complicated by the fact we don't have any training for the whole military problem and we have no service for the whole military problem.

We only have these 3 fragmented trainings and 3 fragmented services.

Perhaps in an ideal country, state, some time, we may have a unified training and a unified service.

Until we do, I take it that your proposal is to take men of character and of age who have no longer any intense personal ambitions with regard to the service in which they were brought up.

It seems to me that is about the only solution we can think of.

Can you think of any other?

Dr. BUSH. I think you are right, sir, and I am perfectly certain that such men can be found.

During the war I had the privilege of acting as chairman of one such committee. It was the committee to which General Groves reported, and it controlled the entire atomic-energy program. That committee was made up of 1 admiral, 1 general, Dr. Conant, and myself. That committee never departed in the slightest iota in its consideration of what would make that program go best by any service consideration, and if a proposal was made that a particular service do some particular thing, the man who came from that service was just as likely as anyone else to say, "I think that can be done better elsewhere."

I know that given the right atmosphere and the right circumstances military men can depart from their service background and take the broad view, and I have known many individuals that could do it.

I am sure the men can be found, and that they can do that sort of thing properly.

Let me say also that this matter of having the right experience can be misunderstood today.

EXPERIENCE OF PAST WILL NOT HELP

If there is another all-out war it will be so different in its nature from anything that has ever gone before that no military experience in the field in the past will ever be sufficient to qualify a man to judge what is going to happen.

That has got to be grasped by a more general understanding and a more general type of intellect and background.

Past field experience of any kind is not going to be a very serviceable thing; if we deal with a war in the future fought by long-range missiles and the like.

Senator FLANDERS. Thank you.

That has troubled me. The constitution of the Board and finding a situation in which men would not consider themselves in connection

with the service in which they were educated and trained has seemed to me to be the problem to be overcome.

Now I want to present another problem.

If I understood you, Dr. Bush, you thought that you could get along somehow or other as best we could with the present situation so far as missiles are concerned.

Now the enterprise of the public press has gotten together this picture which shows all the missiles there are, and it looks to me as if there were too damned many of them.

Dr. BUSH. Of course I realize that.

Senator STENNIS. Let's have quiet please.

Senator FLANDERS. I realize that this picture is in some ways an exaggerated one; some of these missiles are for such different purposes that they are not comparable, but there is, nevertheless, a tremendous complexity in the thing, and I wonder if you really don't think that we ought to—wait a minute, I am getting into a double negative—I wonder whether you would agree that some simplification of this thing ought to be undertaken?

Dr. BUSH. I am sure, Senator, that when the missile problem is now approached in a new light there will be found ways of simplifying it.

Senator STENNIS. Just a minute, please.

Under the rule of the Chair, I understood you gentlemen were to desist after the witness was on the stand.

Senator FLANDERS. I am afraid I tempted them too much.

Senator STENNIS. I was talking to the photographers.

So let's desist on that; proceed, Senator Flanders.

WARNS AGAINST PRECIPITATE SOLUTION

Dr. BUSH. I am certain, Senator, that when the missile problem is approached in the full light of the present day there will be found ways of simplifying it. I would not be at all surprised if ways were found of ceasing work on some missiles to put emphasis on others. The simple caution I wanted to put in is that we should not be precipitate in doing this because the sacrifice of abandoning a program in its last stages is very great, and the saving can sometimes be very small. The time to abandon programs is before they become very expensive.

Senator FLANDERS. Just one other question.

As you know, Dr. Bush, I have been concerned with problems of invention and design and production, and I learned in my experience that it is not wise to let invention and design interfere with production too often. In other words, they—in other words the new ideas should come in bunches if you have got a workable thing. Make it for a while; meanwhile prepare for the next version. In your experience, has there been any tendency to interfere with production, of mass-production objects of defense by improving them continuously instead of in batches?

Dr. BUSH. There always has been and there probably always will be, and there is nothing that a production man resents more.

Certainly your changes should come along in batches. But let me also say this: That there is a vast difference in that regard between an industrial organization where profit must be shown, and due econ-

omy shown, and the situation in time of war, where one can tolerate all sorts of costs provided there is a real object in making a change.

I think we have erred many times in allowing little changes to interrupt production, we have also erred at times by holding production so rigid that changes could not be made. To make a proper balance between those two things requires judgment of the finest sort. That is where an executive in an industrial establishment finds considerable advantage.

Senator FLANDERS. I don't know who it was who said it, but the essential of war was "to get there fustest with the mostest." I am placing most emphasis on the "fustest."

That is all, Mr. Chairman.

HOW STAFF WOULD BE ORGANIZED

Senator STENNIS. Gentlemen, my name is next on the list. I will be very brief.

I want to thank you, Doctor, for your comments on all the problems and especially the one you commented on with reference to the problem of the Chief of Staff, their problem with the problems of planning.

As one who had been on the Armed Services Committee several years, and as one who thinks very highly of every member of the Chiefs of Staff, very highly, men like Admiral Radford, General Ridgway, General Vandenberg, who are no longer among us, among others, I nevertheless felt it is more of a tussle and wrestle between the men and that we do not get the composite advice from them.

I feel like your suggestions are very timely, that something must be done, and that the complex of the fear of the German General Staff or chief of staff, is the real problem. I believe you mentioned that a while ago. I was called away momentarily. But I think your advice is very timely, and that something must be done.

We create additional officers all right. We have a great number of secretaries and assistant secretaries, but we do not get at the real heart of this problem by merely creating officers.

As I understood, you would not confine this planning group, though, to those that were finishing their career. I thought you said you would probably call in some of the junior officers; was that not correct?

Dr. BUSH. Certainly.

Senator STENNIS. Yes.

Dr. BUSH. Certainly, because you will find some of the finest minds you will find anywhere among the younger officers, not necessarily the captains and the colonels, the next rank up, but you want the juniors in, to do the hard thinking and analysis. You want to support this by civilian analysis. You want to give them every facility that they can use.

Let me say again in response to what you said; some of the men that you mentioned are men that I was very fond of. My personal relations with men on the Joint Chiefs have always been very fine, and I have admired them, and some of them have been close friends.

I recognize the predicament in which they are placed. It is an impossible situation to put any man in, and I sympathize with them. They cannot, as a practical matter, do anything but what they have

done. They endorse the plans of any one of their members. They do not interfere with the planning of a single service, and they compromise around the table. It is not good enough, gentlemen.

Now, you can find men who can do better. Some of them are already retired. If they are, bring them back. There is no harm in that; and men can be found and can be put to work, and out of that can come some very good planning indeed, I am sure.

Senator STENNIS. At the present time, they are victims of their own system when they come in there.

Dr. BUSH. Well, I think they are more the victims of your system, because you are the people who passed the Unification Act.

Senator STENNIS. That is well said, but most suggestions I have heard for changing it have been rather stoutly resisted by the services, not that they are too happy with what they have, maybe, but because they think they might fare worse.

Dr. BUSH. You can be very sure if you start a change along the lines I have outlined, or some other lines, that will produce the same effect, it will be very vigorously resisted.

Senator STENNIS. I think we, the Congress, could pretty readily make some good changes if we just had—if the military made up its mind that it wanted the change and would give us the recommendations along the lines that you speak of.

May I mention one other thing here that you have touched on rather fully, but in connection with someone having the authority of unified authority with reference to the various aspects of the missile program, and you said it came up to the Secretary of Defense, and you assumed that Mr. Holaday had the authority that the Secretary had. But, Dr. Bush, does not someone have to make decisions to make this program move that goes even beyond the Secretary of Defense, and has authority over the Budget Bureau or any other department that might not agree with those plans?

In other words, does it not have to be right up next to the President or exercising the President's authority, rather than the Secretary of Defense' authority?

Dr. BUSH. I do not think you people are going to give anyone authority to spend money around here unless you appropriate it.

Senator STENNIS. Well, we appropriate the money sometimes and then it is not spent.

Dr. BUSH. Yes.

Senator STENNIS. Because, we will say, the Budget Bureau or the budget officer or the Department of Defense, they stop them.

But my point is that this authority to have a unified control power to make decisions, and then the authority to make it move, has got to be even above the Secretary of Defense or the Director of the Budget or anyone else. And has it not got to be the President's authority that he is exercising, the President himself?

Dr. BUSH. Certainly, we think that the Secretary of Defense, acting within the authority that he already has, can straighten matters out within the Department of Defense.

Certainly this is broad enough. Certainly it includes also recommending what additional funds he may need. Certainly there are also matters that must be decided by the President of the United States, and certainly if he makes recommendations for more money, they ought to be very sympathetically considered by you gentlemen here.

But I hope and trust that the President of the United States, confronted with this national emergency, is going to give us all of the action that we would ask for, where action by the President alone will resolve the difficulty. And that by giving us that leadership, he will help to keep this country alerted to the danger in which we are placed.

Senator STENNIS. I am sure that is his great purpose, too. But my point is that even if the Secretary of Defense has settled all matters as between the Departments of Defense he does not have the authority and the power to proceed on a certain missile, into development or into production if the Budget Bureau does not agree.

There has got to be an authority, it seems to me, that it is the President's authority itself, someone exercising his powers rather than the powers of the Secretary of Defense. Is that not correct?

Dr. BUSH. Why, certainly.

Senator STENNIS. Yes.

Dr. BUSH. I hope if there is a jam between the Secretary of Defense and the Bureau of the Budget, that the President will resolve it.

Senator STENNIS. And this authority, it seems to me, ought to be really right next to the President, directly exercising his powers, always under his command, of course. You think that is correct?

Dr. BUSH. Why, no, I think I know what you are getting at. I think that the job of carrying this thing out is primarily the job of the Secretary of Defense, and that he can delegate it in such way as he may see fit as he proceeds.

When there are larger questions, things that need to be worked out between the Department of Defense and other Departments; then the thing that the President of the United States should do is to make such decisions with proper advice.

But I do not think we ought to put the management of this program in the President's Office. I think it belongs in the Department of Defense.

Senator STENNIS. I did not mean that. I do not see how he can give so much personal attention to so many decisions because of his other duties and worldwide demand.

What I was thinking about was someone authorized to act for him, even if it was over and beyond in some cases, the Secretary of Defense or the Director of the Budget, and until someone is so authorized they cannot act for the President. But it has to have his personal attention in all these matters. I am sure we are striking at the same thing here.

Dr. BUSH. Yes; in a little different way.

Senator STENNIS. Yes.

Dr. BUSH. Because my concept is that the President, with his enormous responsibilities in many fields, that he cannot possibly cover in detail personally, must bring action about through men he trusts, through men who understand those fields and men upon whose advice he is ready to act. That is the way he has to operate.

Senator STENNIS. Well, I thank you, Dr. Bush.

Senator Smith?

Senator SMITH. Yes; Mr. Chairman.

Dr. Bush, what is your feeling about cancellation and termination of the Air ROTC in technical and scientific schools at California Technological Institute?

Dr. BUSH. I really do not know, Senator Smith; I really do not know enough about it to be entitled to an opinion. I have not studied it recently.

ROLE OF AIR FORCE ACADEMY

Senator SMITH. Dr. Bush, do you feel it is realistic for the Air Force Academy to continue stressing training of pilots or do you think that the Air Force Academy should start training its cadets to be technicians and scientists?

Dr. BUSH. Let me answer that a little more generally in regard to all three services. There was a time, and it is not so long ago, that if a man in the services, in uniform, paid a great deal of attention to the technical aspects of his profession, to the scientific aspects of his military arm, by so doing he sacrificed all possibility of ultimate high command. He became a special category where he could go a certain way but no further.

That was due to some strange feeling that a man, to exercise command, must not become a specialist; or, to say it the other way, that a man by becoming a scientific specialist or an engineer disqualified himself in some strange way from becoming a commander.

I think that was a complete fallacy, and I think it did us a great deal of harm, because it threw an obstacle in the way of many of our military officers becoming highly qualified technical men.

Now, many of them are. Many of them are excellent engineers. Many of them are good scientists in their own right, entering science as I did from engineering.

I take my hat off to the ones who have done this. But the cards have been stacked against them for a long time, and I think the obstacles have not today entirely been removed.

Certainly, on the second part of your question, today we are talking about emphasis on science in our high schools, of continuing its emphasis in our universities of having a better atmosphere for the carrying on of science in this country. It certainly is true, when we say all of these things, that with still more emphasis, the service academies have got to do a better job in teaching science to men that they take into the military services, and a far better job than they have done in the past, so that we may have more officers with a thorough understanding of the things they need to understand.

Senator SMITH. That is all, Mr. Chairman.

Senator STENNIS. Senator Symington.

COMPLICATED COMMITTEE STRUCTURE

Senator SYMINGTON. Dr. Bush, this is where you and I came in. [Laughter.]

I was interested in your testimony about missile reorganization, and noticed a chart put out by the Assistant Secretary of the Air Force in charge of Research and Development recently in Life magazine. Have you seen that chart?

Dr. BUSH. Yes, sir.

Senator SYMINGTON. On this chart there are 95 boxes of authority.

Dr. BUSH. Yes, sir.

Senator SYMINGTON. Since that time, so I understand, they have added a couple more boxes.

Dr. BUSH. No doubt.

Senator SYMINGTON. Is that what you were talking about when you said that you thought there could be a general reorganization of this setup?

Dr. BUSH. Yes. That is one of the things I had in mind, Senator. I think that it certainly is possible to simplify that structure, so that the man who is working intensely in this field, who is in charge of one laboratory let us say, will know where he can go and get clear-cut decisions, and get them at once, and not get lost in the maze of Washington, which, I think, is what now happens to a great many people.

Now, beyond that, I would say this: that how to do it, just where one should streamline it, and so forth, I do not know. I would have to study it plenty before I would think I was entitled to an opinion as to exactly what I would want to see done. But I think we have got competent men in office to do it.

Senator SYMINGTON. Without passing you any bouquets unnecessarily, it is a fact you have probably had more administrative experience in the combined fields of engineering, science, and government than anybody I know.

Could you run anything on this basis?

Dr. BUSH. When I ran the Research and Development Board, Senator, it got to be pretty bad, but I do not think it got to be that bad. But there is a tendency of any governmental organization to grow, to branch out, and to take on additional buds and pockets and so forth, and this has happened to me in the past.

But I think, having looked at that chart, if that chart is accurate, that this has really gone to the point where a thorough job of reorganization and simplification is in order.

Senator SYMINGTON. Have you ever figured out in your own mind, based on your long experience inside and outside the Pentagon, what a true businesslike job of streamlining responsibility and authority over there would save, in your opinion, the American taxpayer?

Dr. BUSH. Well, you know, you are asking an impossibility. A governmental operation can never be like an industrial one. The conditions are entirely different.

For one thing, no man who runs a bureau in Washington has a single boss to report to, or a board of directors. He has about 18 places that he reports to. He reports to the committees of Congress, perhaps to the head of his department, or to the President, to the Bureau of the Budget, to the Civil Service Commission, to the Comptroller, to say nothing of the General Services Administration.

He has utter confusion when he tries to find out where he gets his instructions and his authority.

In industry, he has got a single board of directors, and if he can satisfy them, he can go ahead.

So, we never can have in government a nice simple affair as we can have in industry, and I do not think we should be too critical of the men who put together Government organizations. They do become unduly complex under these strange conditions, and I just hope they will not get too bad.

Senator SYMINGTON. We have talked a lot about missiles, and an organization with respect to missiles.

But what you are talking about, from the standpoint of how to do the job, does not just stop at the missile field. It embraces the entire concept of the Department of Defense, does it not?

Dr. BUSH. Quite right, sir.

Senator SYMINGTON. Thank you.

Dr. BUSH. And missiles are a new affair. They look to be exceedingly important.

But I think one thing that needs to be done as we proceed and as we get long-range missiles, is to make an examination of the relative effectiveness for various purposes of manned bombers and missiles.

It is not entirely a one-sided argument by any manner of means, and I hope and trust we will not precipitately consider as Brother Khrushchev apparently does, that the aircraft is obsolete. It is not, by any means.

Senator SYMINGTON. Thank you, Doctor.

Senator JOHNSON. Mr. Case.

Senator CASE. Thank you, Mr. Chairman.

Dr. Bush, I agree pretty much with what Senator Symington has said with respect to your long experience. I always feel when you testify on things like this, it is the voice of experience, and you certainly have had more experience in coordinating or directing scientific work in Government than anyone that I know.

And based on that, and based upon the fact that you were the Director of the Office of Scientific Research and Development during the war, would you say that your responsibilities and your powers in that position were those of a czar or a coordinator?

Dr. BUSH. I was a czar in my own area.

Senator CASE. Was that primarily in the field of research or production?

Dr. BUSH. Research, development. In missiles, weapons, generally, and in the field of military medicine.

WOULD KEEP DEVELOPMENT IN DEPARTMENT OF DEFENSE

Senator CASE. Do you feel the present situation calls for somebody with the authority of a czar in the field of research and development? And would you distinguish between research and development and production?

Dr. BUSH. Well, to answer the second question first, most decidedly I would. They are very different things, and they have to be treated in a vastly different manner. I would not recommend at the present time a civilian organization outside of the Department of Defense carrying on military development. It is a very different thing in wartime from what it is in peacetime, for many reasons.

For one reason, in wartime the services are so busy with the immediate job of fighting the war they do not have time or the personnel for development, and if it is going to be done at all it has got to be done outside.

In the second place, the development of a weapon calls for many steps, research, engineering, finally production, experimental tests in the field, training, many aspects which are first civilian and then military.

It can be carried on only by the closest of cooperation between the developers and the military who will use the results.

In time of war, that cooperation is almost automatic, because cooperation between people in time of war occurs spontaneously.

In time of peace, I do not believe that a separate organization, outside of the Defense Department, engaged in developing military

weapons could be appropriately linked in with the military structure for collaborative work. I think that coordination had better be done within the Defense Department itself.

Senator CASE. That is all, Mr. Chairman.

Thank you.

Senator JOHNSON. Thank you, Senator Case.

Senator BUSH.

Senator BUSH. Dr. Bush, because of my great admiration for your many accomplishments and contributions to our national welfare, I have long tried to establish a blood relationship with you, but after hearing you today, I am sorrier than ever that I have been unable to do that.

But I want to for a moment, raise just one question, the same as I raised with Dr. Teller, and that goes down to the field of elementary and secondary education.

I think possibly you heard the great emphasis which he laid on that question, and I would like to ask you whether you share his views respecting our serious deficit at that level of education. And also if you would care to comment on anything that should be done, and particularly that we, the Congress, might do, to assist in curing that deficit.

Dr. BUSH. I most certainly do agree, sir. There is no doubt in my mind that we have got to do a far better job in our secondary education in the training of scientists.

We have a situation in this country today which is appalling. At the same time that Russia is doing a fine piece of work in inculcating its youngsters in science, we have a situation where there are many high schools in this country where there is not a single member of the faculty who ever studied science in any form.

We have a situation where the youngster who becomes interested in science has no place to turn.

I believe there is a great deal to be done. One thing, important, is that we need to increase the compensation of our secondary school teachers, where they are good teachers. And I believe very emphatically that we must in one way or another work out a merit system of compensation, that this cannot be a blanket increase for all teachers; that it must provide a way in which the really excellent teacher can acquire a better income, so that he will not be immediately attracted out into industry in order to be able to carry on his family in a dignified way.

I believe far beyond that, that we need to restore the high school teacher to a position of respect in his community. There was a time, when I was a youngster, when the teacher of science in the high school was regarded as a man of real stature in the town in which he lived. He was a citizen that was respected, that was regarded as one of the guiding individuals of the town.

We have slipped badly in that respect, and all too often it is said of such men today that they are teaching because they cannot do anything else, which is a calumny.

There are many good teachers in our high schools, who are devoting their lives to the cause because of their love of youth, and because of their love of teaching. And they are doing it in spite of the fact that they are underpaid, and they are doing it in spite of the fact that they are not given proper recognition in their community.

Let us at least restore those men who are doing a good job to positions of real respect.

DOES NOT FEAR PREJUDICE TO OTHER LEARNING

Senator BUSH. Do you think the science teaching profession could be singled out and should be singled out——

Dr. BUSH. I am afraid it has to be, Senator.

I deplore overemphasis on science at the expense of the humanities as much as any man, but I think we are so far from that condition that we are in no danger whatever of overdoing it for a long time to come, and that we can, with a clear conscience put our emphasis on getting good science teachers.

Now, there are many ways of going about it, and one way that I would recommend exploring is this. In the field of higher education we have perhaps 1,500 colleges and universities in this country. They differ enormously. There are specialized institutions, and there are institutions that are far more general. There are liberal arts colleges of small size; there are great universities.

In our high schools, we do not have that differentiation. In some of the large cities, we do to a certain extent, but I think we can carry it much further, and that in our cities of any size we could have special high schools, open to those students who have shown proficiency and earned the transfer, in which would be excellent teachers of science, and where science would be emphasized.

Senator BUSH. Just one final question on this point.

What do you think the Congress can do?

Dr. BUSH. I think if the Congress——

Senator BUSH. Sir?

Dr. BUSH. If the Congress is going to approach this field at all, I hope and trust that it will enter it without taking the control of the schools from the local communities in any regard whatever, for I am a great believer in having the schools run by those who are close by and who understand them.

But even without interference, I think the Congress of the United States might readily make funds available to any State or any community that would set up a special system of schools for the teaching of science in an advanced manner by excellent teachers, to which students would be admitted who showed a proficiency in science, with no control, but merely with the requirement that they meet that criterion and attempt that end.

Senator BUSH. In other words, that we should offer some subsidy for the establishment of such schools?

Dr. BUSH. That is the point.

Senator BUSH. Not take them over.

Dr. BUSH. Right.

Senator BUSH. Or furnish the whole subsidy.

Dr. BUSH. Right.

Senator BUSH. But to offer some special stimulation, financial aid, for the establishment of special schools in the elementary and high school levels for teaching science.

Dr. BUSH. That is right. That is one thing. There are other things, but that is one suggestion.

Senator BUSH. Well, I would simply say, in closing, I do not want to prolong it, but if you think about things that we should do, I hope

you will advise this committee as soon as possible, because I think this is one of the most important questions we shall have to deal with in January.

Dr. BUSH. Yes, sir.

Senator BUSH. I have nothing else.

Senator JOHNSON. Thank you very much, Senator Bush.

Senator Barrett?

THE SPUR OF APPRECIATION

Senator BARRETT. Thank you, Mr. Chairman.

Dr. Bush, I have been impressed with your statement here this afternoon. I was somewhat surprised at your suggestion that scientists worked well when they are playing to an audience, that they really look for the appreciation of the people in their communities and of the country as a whole.

I have in mind that people generally over the country are well acquainted with the great service you have rendered in the scientific field, and Dr. Teller and several others in that respect, but there are a good many of unsung heroes in the scientific field, and I was wondering what you would think about a congressional scientific medal that might be awarded by the National Science Foundation for those men.

Dr. BUSH. Perhaps I did not express myself well, Senator. What I had in mind was this, by that expression of mine.

I think scientists are primarily interested in doing a good job; that they are in general not very much interested in monetary reward if they can live reasonably. They do not care too much about popular acclaim. That is not the kind of thing they want.

But they do like to feel that their work is appreciated by those who understand it, and particularly by their colleagues, by their peers in science and, beyond that, by the members of their community, those that they mix with.

If they mix with individuals who say, "Oh, well, this man is a scientist; I have got nothing to do with him," it is disheartening.

But if they mix with people who are interested in science; anxious to know more about it, who appreciate its importance as a cultural affair as well as a practical affair, they work better as everyone does when his work is appreciated by those who understand him.

On the matter of a medal, I will have to admit I am exceedingly skeptical on the matter of medals. I think sometimes they can do a great deal of good when they can be given to a young man just beginning to make his way, as a token that those who had gone further recognize him and feel he has done a good job.

But in general, the subject of medals I think is overdone, and I believe that there are far better ways in which this Congress could show its appreciation of scientific work.

Senator BARRETT. What would you suggest as a better way?

Dr. BUSH. Well, for one thing, if you want a specific example, the National Science Foundation was set up to further basic scientific work in this country. Before the war we lagged behind Europe on basic scientific work.

Since the war, we have done better. We by no means do enough at the present time in basic science, in fundamental science. We

have come nearer to taking our proper position in the world in that regard, but we still need to do far better.

So I would say to you, having established the National Science Foundation, by all means support it so that it can do a thorough job.

Senator BARRETT. That is all.

Senator JOHNSON. Thank you very much, Senator Barrett.

Counsel, do you have any additional questions?

Mr. WEISL. No, sir.

Senator JOHNSON. Does any of the Senators have any questions?

BASIC RESEARCH INDISPENSABLE

Senator CARROLL. Mr. Chairman.

Senator JOHNSON. Mr. Carroll of Colorado, who is not a member of the committee, but we are delighted to have him here, and we are urging him to participate.

Senator CARROLL. Thank you, Mr. Chairman.

I have been visiting the scientists in the Bureau of Standards out in Colorado, they have told me, substantially what you have testified to here today, except they have divided the missile program into two parts.

I understand that you have said that you are an engineer, not a scientist. They say the first part of the missile program is really an engineering program.

Their great criticism is our lagging behind in basic research, and these men—I understand there are 300 or 400 scientists out in that Bureau, and they have a feeling that their appropriations and their contracts that come from the military are subject to change and while they are utilizing the scientists, they will get into a program and then get pulled out of it again, and sometimes it will take 3 years to do a basic research job as a result of this uncertainty.

That leads me to the question: Which do you think, to use the comparison, is most important, the missile development or basic research?

Dr. BUSH. Well, you cannot do one without the other. When the program on atomic weapons started, there was involved in it fundamental science of the most basic sort, then applied science, engineering, and finally production.

Now, the same thing is true of the missile program. We could not be at our present position today if there had not been a great amount of basic research, fundamental research, on fuels, on the guidance systems, on the performance of gyroscopes, on many subjects of that nature; if there had not been the application of applied research that took these things out of the laboratory and began to approach them in an economic manner to see what could be done with them, and if there had not finally been engineering and design for production and all the rest.

Senator CARROLL. In other words, the basic research was first. Do you now agree it is an engineering problem?

Dr. BUSH. In the missiles field, the primary job of the missiles field today is an engineering problem. But by no means let us stop our basic research, for the missiles that we have in mind today are not the last missiles that will be produced, nor the most effective ones. And we wish to have the best missiles, not 5 years from now, but also 25 years from now.

Senator CARROLL. Doctor, I completely agree with you, and from the statement of those scientists to me in Colorado, they make this further statement: that had it not been for Sputnik No. I, their appropriations would have been cut off in basic research. As a result of that happening, there has been a great awakening, and some of the basic research programs have been reestablished, but such programs are still dependent upon military contracts.

And I think MIT is the, whether I say the originator, at least they are the contracting agents. So you would certainly say that basic research is a vital and important part of our scientific advancement?

Dr. BUSH. Well, I am chairman of the board of MIT, but I didn't know that particular detail. I did not realize they were the contracting agency on the missile program.

Senator CARROLL. No; this is on basic research.

Dr. BUSH. Oh, yes.

Certainly this is true, gentlemen; we have had in this country a great distrust of scientists since the war. We have called them eggheads and highbrows. We felt they were not to be trusted.

We have occasionally pilloried them in our attempt to preserve secrecy.

A large part of that goes back to our smugness, it goes back to our overconfidence, to our egotism. Well, we felt that if we were way ahead of the world, could just preserve our secrets, all would be well.

I hope and trust that we have now matured, and that we can see the thing in a more clear light, and realize that we are in real competition where we probably have as many secrets to learn as we have to lose, where overemphasis on that sort of thing is infantile.

I hope that we have come to the realization that we must no longer depend upon Europe for our basic research; but that we must have in this country, in every field, important basic research of the first water, of which we can be proud.

We must acquire that position if we are to preserve our national self-respect.

ARE YOUNG SCIENTISTS UNDULY RESTRAINED

Senator CARROLL. Just one further question, Mr. Chairman.

I have been led to believe that, from my discussion, these are younger scientists, Doctor, they think that the scientists of the National Science Foundation, and perhaps the Academy of Sciences, have been a little bit conservative, and these young scientists feel they are not being fully utilized.

Would you say that their lagging behind in this program is a failure to utilize our scientists? Is there a shortage of scientists that causes it?

Dr. BUSH. Well, there is a shortage of scientists, all right, and it has been very clearly pointed out to us if we do not get busy about it, our shortage of scientists vis-a-vis Russia is going to get much worse in the future, certainly.

Now, on this matter of the young chaps, don't worry about the young scientists. They always chafe at control, and I hope they always will. Most of our production of forward-looking science is done by the younger men. I am very glad that they are restless. If they were not, I would feel sure something was wrong. If they are any good, they will always be restless.

Senator CARROLL. Well, the opinion they expressed to me, Doctor, was that they felt that their appropriation, coming from the military—and this sort of fits in with what Senator Kefauver said—that the military many times would give an appropriation for basic research; they would get halfway through with it and would be pulled out of it because it was not fast enough for a military project, when many times the basic research might take 3 years, and that is why I wondered if, perhaps, we are fully utilizing our scientists and their own ability in the field of science.

We talk about the military. We have talked about these other agencies. And if Colorado and the Bureau of Standards is any criterion, it seems to me—if they are correct—they claim they are not being fully used, and I ask you to think about that as you think about the question that Senator Kefauver put.

Senator JOHNSON. Are there any other questions by any other Senator?

Dr. Bush, as I said when you appeared earlier today, once again the country has turned to you for advice and counsel in time of crisis. And, as always, we have found your ideas challenging and stimulating and interesting. You have raised an issue that is basic to this whole problem, and that is the form of our military structure.

This is one issue which has troubled thinking people for many years, and there is no simple answer to it, but the necessities for an answer become increasingly apparent.

This is not a question which can be settled overnight, but it is, obviously, something to which the Congress will have to give careful thought and attention in the days that lie ahead. And I am going to attempt to see to it that that is done.

Dr. Bush, you can look back upon a long life in which you have served your country in both war and peace. Your name is one of the most eminent of our scientists or engineers who have kept our level of technology high. Your contributions have been many, and the testimony which you gave us this afternoon has been on the same high level of all of your past services to this Nation.

You addressed yourself to the basic issue—what is to be done?

I want to point out that I am sure, before these hearings are concluded, we will go into budgets, we will talk about appropriations; we will review what the Congress has done and not done, what the Executive proposes and what he disposes.

But, without getting into the dollars now or the budget now, the physical situation now, the chairman of this committee is going to insist that each witness say, in as plain, simple terms as possible, where he who listens can hear, the answer to one simple question: What can be done?

And, Dr. Bush, on behalf of the committee and on behalf of all Americans, I want to express to you my deep gratitude for your constructive contribution. You and Dr. Teller have made this a very unusual day, even in the life of the Senate. Thank you, sir.

Dr. BUSH. It has been a pleasure to be with you, sir. It seems like old times. I have had many a pleasant session here on Capitol Hill, and to be associated with you gentlemen in this crisis is not only a duty and a privilege, but, I can assure you, a rare pleasure.

Senator JOHNSON. Thank you, Doctor.

Senator SALTONSTALL. Mr. Chairman.

Senator JOHNSON. Senator Saltonstall?

Senator SALTONSTALL. Might a Massachusetts man say, Mr. Chairman, that we are mighty proud of the Massachusetts Institute of Technology, and the men who produced it, and Dr. Bush is one of its leaders.

Senator JOHNSON. Dr. Bush, we have this problem: I have to go back to Texas to campaign to get reelected, to see my constituents. Senator Saltonstall can just sit here at the table and hear his constituents all day.

TESTIMONY OF JOHN CHIPMAN, CHAIRMAN, DEPARTMENT OF METALLURGY, MASSACHUSETTS INSTITUTE OF TECHNOLOGY

Senator JOHNSON. The next witness is the distinguished Dr. John Chipman. For the information of the press, we plan to ask Dr. Chipman to testify this evening. We trust that it will take somewhere in the neighborhood of an hour's time, maybe a little longer, but not much longer, if members will keep their questions brief. We expect to conclude today's hearings with the testimony of Dr. Chipman.

Tomorrow we will begin with Dr. Hagen, General Doolittle, and then Mr. Allen Dulles and his entire staff will be in executive session. I expect they will come on in a 1 o'clock session tomorrow afternoon.

We may get to Secretary McElroy tomorrow. I doubt it. He will be standing by.

Secretary McElroy, if we don't get to him tomorrow, will come on Wednesday morning, to be followed by Under Secretary Quarles and Mr. Holaday.

We plan to conclude this part of the hearings on Wednesday. The staff will then proceed with its investigations and studies and its interrogations and prepare an agenda for the hearings to begin on the 13th of December.

Thank you, Dr. Bush.

Dr. Chipman, will you please come forward?

Will you raise your right hand, please?

Do you solemnly swear that the testimony you will give this committee will be the whole truth and nothing but the truth?

Dr. CHIPMAN. I do.

Senator JOHNSON. Dr. Chipman, the committee takes a great deal of pleasure in calling you as its next witness.

Dr. Chipman is chairman of the department of metallurgy at the Massachusetts Institute of Technology and one of the leading experts in this field.

For the benefit of the record, Dr. Chipman is a native of Florida. He received his bachelor of science degree from the University of the South in 1920, his master of science degree from the State University of Iowa, 1922. He was awarded a doctor of philosophy degree by the University of California in 1926, and his doctor of science degree by the University of the South in 1940.

Dr. Chipman's career includes service as an associate professor of chemistry at Georgia School of Technology and as a research engineer for the University of Michigan. From 1934 to 1937, he was associate director of the research laboratory for the American Rolling Mill Co.

In addition to being a distinguished scientist, Dr. Chipman is in possession of fresh information about the Soviet Union. He has recently returned from a trip to that country, where he had a firsthand opportunity to observe some of its production and research facilities.

Dr. Chipman, the committee is honored to have you with us today, and we are very happy you have agreed to come here and make this contribution.

Mr. Weisl, will you proceed with your examination?

THE BOUNDARIES OF METALLURGY

Mr. WEISL. Dr. Chipman, will you please briefly describe the science of metallurgy?

Dr. CHIPMAN. I would be happy to do that.

Metallurgy is probably best rated as engineering rather than science, though it is based heavily in science also.

As an engineering field, it has responsibility for two major things: One, the extraction of metals from the ores, refining them, making them useful. This embraces such industries as steel, aluminum, copper, titanium, other metal producing industries.

On the other hand, metallurgy also has responsibility for the intelligent use of metals, the application of the right metal to the right spot, the development of new alloys where no alloy exists to do the job.

Mr. WEISL. Would you be kind enough, Dr. Chipman, to tell us the part that metallurgy plays in the manufacture and use of defense weapons, including missiles?

Dr. CHIPMAN. Now, sir, I am no authority on missiles, nor on any other defense item at the present moment. Metallurgy has contributed to many such defense items as, for example, the bombs which we used in the past war, the atomic bombs, which were used.

Metallurgy has contributed much to further development at Los Alamos; and Oak Ridge has very active metallurgy sections, and the whole development of high-temperature metals for all conceivable uses where high temperatures are involved is a metallurgical problem of the first magnitude at the present time.

Mr. WEISL. That is particularly important in the reentry problem of the intercontinental ballistic missile, is it not?

Dr. CHIPMAN. This will fit, it is important in such items also as gas turbines, jet engines, missiles, too, I have no doubt.

Mr. WEISL. You visited Russia in June and July, did you not?

Dr. CHIPMAN. I did.

Mr. WEISL. What particular plants or institutions did you visit?

Dr. CHIPMAN. I went over to attend a metallurgical conference. There were only a few people invited from outside the Russian sphere. I was fortunate to be one of these.

I was invited, I believe, because a former student of mine was the chief organizer of this particular meeting. He made it a point to take me personally to visit a number of their steel plants.

I was quite well impressed by these plants. If I may, I would like to tell you about two of them.

Mr. WEISL. Where were they located, Doctor?

Dr. CHIPMAN. One was located a hundred miles from Moscow. This is a small plant, an old plant. The thing that impressed me

there was that the whole steel plant is used for research and development, for developing new ideas in how to make steel.

It is a small plant. It was all devoted to that.

Mr. WEISL. Is it manned by scientists?

QUALITY OF METALLURGICAL ENGINEERING

Dr. CHIPMAN. It is heavily staffed by scientists; yes; and habituated by visitors from the Academy of Science and other research laboratories.

The other plant which I might like to mention is a modern new plant at Magnetogorsk. This is out in the Ural district, they call it the Ural Mountains, but there are no mountains in sight.

It is out on the Siberian Plain. Magnetogorsk has beside it quite a hill of fine iron ore which they are mining and handling very intelligently.

Their metallurgical engineering, as exhibited in this plant, is as good as you will find in this country or in any part of Europe.

They have done an outstanding job, and have applied very sound engineering principles to the problems of design and operation of this plant.

Mr. WEISL. Were you able to discuss freely problems with the staffs in these plants?

Dr. CHIPMAN. Yes; we were.

They did not hold back on any questions regarding the plant. They took us to all parts of the plant we wished to see, and we then sat down and they answered all of the questions we wanted to ask them.

They, in turn, had some questions regarding American steel industry, which we were happy to try to answer for them.

Mr. WEISL. Did you find those plants modernly equipped?

Dr. CHIPMAN. This fairly new plant at Magnetogorsk is very modernly equipped. They have 8 blast furnaces there, 4 of which would rate as about the biggest in the world, as big as our biggest, and as productive as our biggest.

This productivity is achieved by the application of straightforward fundamentals of engineering.

Mr. WEISL. How do these plants compare with American steel plants?

Dr. CHIPMAN. They compare on a par with American steel plants, by and large.

I should say in respect to electric furnaces, I saw nothing that could quite compare with what you can see in this country in electric furnace steelmaking, but in blast furnaces and open hearth furnaces which constitute the backbone of the steel industry, the plant at Magnetogorsk seemed to me to be as good as anything we had.

Mr. WEISL. Was research conducted at that plant also?

Dr. CHIPMAN. Yes; the plant has an active research department which is busy in the solving of immediate plant problems. The steel industry itself supports a number of research institutes in various parts of the country and the more fundamental research is done in these institutes.

SOME OF EQUIPMENT BETTER THAN OURS

Mr. WEISL. Did you visit any research laboratories?

Dr. CHIPMAN. Yes, sir, we did.

Mr. WEISL. Where, sir?

Dr. CHIPMAN. We visited a number of the institutes. We visited two institutes which are supported by the Academy of Science, the Soviet Academy of Science. These turned out to be very excellent, research establishments. They have equipment some of which is beyond anything I can lay my hand on for my research work. They have staff many of whom we recognize by their works that we have been reading, many of whom have their international reputations.

These people received us in a friendly manner. They answered all questions that we asked, and we had quite frequent technical discussion with them.

Mr. WEISL. You felt that they held nothing back?

Dr. CHIPMAN. Now, we did not ask them questions which we thought would be classified. Neither did we encourage them to ask us such questions. We talked about the steel industry, basic research, of papers which they have published, fields of research which are open to public discussion the world over.

There was no holding back in such things.

They showed us also some of their newer developments of alloys that have not been published. We did not ask about defense items or about nuclear items.

Mr. WEISL. Did you study the training system or the educational system?

Dr. CHIPMAN. We had a good look at that. We visited four of their teaching institutes. We also visited the university but the university was closed for the summer and we did not see anyone there to talk to.

But in the four teaching institutes that we visited, we did see the people, the professors who were doing the teaching.

We learned that a metallurgist in Russia enters a research institute from the high school at the age of say 17 or 18, and he has a 5-year curriculum or a 5½-year curriculum in some cases as contrasted to our usual 4-year curriculum.

The first 3 years of this curriculum are not too different from our first 3 years. They are pretty broad basic studies of science, and engineering fundamentals, and as I looked over their programs, they looked good, to me, for the first 3 years.

Now, the last 2 years are very different from our type of education. The student specializes very narrowly in a field, for example, ferrous metallurgy, that is iron and steel, or nonferrous metallurgy, involving other metals.

But he specializes more closely than that. If he is a specialist in iron and steel he can specialize more intensively in blast-furnace or open-hearth or electric-furnace steel or in steel rolling, or in steel casting.

This is the sort of specialization which we do not recommend, and do not follow in our schools because it partakes so largely of the nature of job training.

Now these Russian metallurgists, when they graduate with a diploma, are given jobs in the industry for which they have specialized,

and I have no doubt at all but what they are better equipped for that specialized job than our own graduates would be for that job.

PROCESS OF SELECTION

Mr. WEISL. How are these metallurgic students selected?

Dr. CHIPMAN. They come out of the high schools and take competitive examinations. There are about 4 or 5 applicants for each that is admitted to the metallurgical institute.

I am speaking here of metallurgical institutes, because it was these institutes that we studied closely. We assume that somewhat similar situations exist in other fields, but it is hard to believe that there are 4 or 5 applicants for every possible opening throughout the educational system.

Mr. WEISL. How is the tuition provided for these students?

Dr. CHIPMAN. There is no tuition charged in any of the institutes.

The students, on the other hand, receive a stipend for attending. A freshman goes in at 300 rubles per month stipend.

Mr. WEISL. That is the equivalent of about \$75 a month.

Dr. CHIPMAN. Something like that. It is bare subsistence, and he has a cheap room and cheap meals provided by the institute. In his second year he is promoted, he gets an extra 50 rubles a month, and by the time he is a senior he is drawing down 600 rubles a month. If he comes back as a graduate student, after 2 years in industry, he has a stipend of a thousand rubles a month.

Mr. WEISL. Did you learn what the teachers were paid?

Dr. CHIPMAN. The teachers are well paid. We learned that, but I do not recall the figure.

Mr. WEISL. Did you learn that their salary was on a par with teachers similarly situated in this country?

Dr. CHIPMAN. They are on a par with the best in this country, I think.

Mr. WEISL. And when a student graduates and is placed in industry, have you any idea what salary he receives?

Dr. CHIPMAN. Yes, he goes in at about a thousand rubles per month. His foot is on the bottom rung of the ladder.

Within 4 or 5 years he will be getting 4,000 or 5,000 rubles per month.

Mr. WEISL. And that is the equivalent, as I recall, of about \$1,250 a month in our money?

Dr. CHIPMAN. Something like that.

VISITS WITH CIVILIANS

Mr. WEISL. Did you visit any of the civilians, people other than scientists or students in Russia?

Dr. CHIPMAN. We visited a number of museums, art galleries, churches. We even went to church in a very active church of the Russian Orthodox faith and that was an interesting experience.

Mr. WEISL. Was the church well attended?

Dr. CHIPMAN. Not well attended; no, mostly old people. There were perhaps—well there were quite a few monks in the place and we were received very hospitably, we were introduced to the archbishop by our guide and he personally took us in to see this cathedral. We

visited a number of other things one of which I would like to mention to you.

There was a Boy Scout camp—rather a Boy Scout-Girl Scout camp. They call them Pioneer camps in Russia. We went because the son of our guide was there and we had a day to spare. It turned out to be very interesting. They have 450 children in this camp. Soon, shortly after we arrived, they finished their rest hour after lunch and came out to report all present and accounted for in formation and the director of the camp introduced me and my companion to them as visiting American scientists. They were not scared of us. They did not throw bricks at us. They did not even look cross at us. They were friendly. The appellation "American" was not something that they distrusted. They gathered around us and asked questions.

Through my companion who speaks a little Russian and our interpreter who did a good job they asked us questions about American children. Did we have any children? Well, why didn't we bring them with us? What do American children play? How do they live, and so on. These children were as friendly as they could be. There was no hint that they had ever heard any anti-American propaganda. I was impressed by this. I wondered how a bunch of our Boy Scouts would receive a couple of Russian visitors.

Mr. WEISL. You felt they were friendly, were not suspicious of you?

Dr. CHIPMAN. Friendly far beyond anything I would have expected.

Mr. WEISL. And they were very much interested in the United States?

Dr. CHIPMAN. Quite so.

Mr. WEISL. And our people?

Dr. CHIPMAN. We found this friendly interest everywhere we went, I might say. We expected this more or less among our scientific colleagues, but there was no evidence of hostility toward American visitors at any point.

Mr. WEISL. No hostility anywhere?

Dr. CHIPMAN. Nowhere.

NEW STEEL PLANTS GOOD AS ANY

Mr. WEISL. From your observation, Dr. Chipman, what conclusion would you draw as to the status of the Russian steel industry?

Dr. CHIPMAN. The Russian steel industry is smaller than our own; it is growing fast. It has very competent leadership, and the planning, I think, is sound. The new plants that they are building are as good as you will find in the world.

Their rate of growth proportionately, I believe, is a little greater than ours, and they have no recessions.

Mr. WEISL. Have you any idea what percentage of their steel industry is devoted to war purposes?

Dr. CHIPMAN. No, sir; no idea whatever.

Mr. WEISL. Could you deduce or give us some idea of how much of it is devoted to war purposes?

Dr. CHIPMAN. We saw in the plants that we visited nothing that looked warlike at all.

Mr. WEISL. But could you see from your observation of the country that very much steel was used for purposes relating to heavy industry or to the war?

Dr. CHIPMAN. This is right. Much of their steel goes to mining equipment, metallurgical equipment, new steel plants, new plants of other kinds. Undoubtedly some of it goes into war plants; we would not have been taken to see such things. We had no opportunity to see it and we did not.

Mr. WEISL. Did you observe the transportation system of Russia during your visit?

Dr. CHIPMAN. I suffered under the transportation system of Russia. From Chelabinsk to Magnetogorsk is 180 miles, 13 hours by train. The transportation system is not very good. I understand that the Trans-Siberian Railway is very busy with a train every 15 minutes, day or night. This is what my Russian friend told me. But our little experience with the transportation industry leads me to believe that they have a long way to go in passenger transportation.

Mr. WEISL. Then you would say very little of their steel is used for transportation?

Dr. CHIPMAN. I think much of it has been used for improvements in the Trans-Siberian Railway. I know that some extensions have been made in the Far East in that railway, and this certainly must have taken a considerable amount of steel.

Mr. WEISL. Do they supplement their rail transportation with roads?

Dr. CHIPMAN. The roads system is worse than the rail system. Around Moscow, for 30 or 50 miles in either direction are good roads, but the cross country roads are pretty bad.

Now, I would like to make one other remark, that if the Russians have any control of weather, they were not exercising it when we were there. [Laughter.]

The roads, some of the roads that we encountered were hub deep in mud, plain old mud. It had been raining considerably more than they wanted, and this is like Illinois roads were 40 years ago exactly. They are that far behind us in the general highway system.

PEOPLE IN THE COUNTRY POOR

Mr. WEISL. Could you tell us something about the standard of living of the average person in Russia?

Dr. CHIPMAN. This would be hard to judge directly, because we did not go into any average home.

The standard, if one can judge by the external appearances of their houses, is very, very low.

These people are poor. The people out in the country are poor. They have little houses, they have little garden plots, their clothing, everything shows that they are poor.

The people in the cities are better off. Many of the old log houses of the cities are being torn down in favor of new and big apartment houses, but the individual apartments in those houses are very, very cramped.

So that living conditions, the standard of living is away low by our standards.

HEAVY GROUNDING IN MATHEMATICS

Mr. WEISL. Is there anything further you would like to state, Dr. Chipman, about their research laboratories, their research development or their research program?

Dr. CHIPMAN. I think I would like to point out some things about their educational system.

The kids that go into the teaching institutes, the metallurgical institutes or the university, they have had in their preparation mathematics all through their lower grades in high school.

They have had at least 3 years of chemistry and physics each. They have had some biology. They have had modern languages, many of them have studied English for 5 years.

English is the popular language with them, and 80 percent take English.

Mr. WEISL. What percent?

Dr. CHIPMAN. Eighty percent take English. This is carried along into their high schools, also.

Their educational system in the institutes of college grades, as I pointed out, is too specialized for our American needs but I think it fits their needs probably quite admirably.

Mr. WEISL. Is there anything more you think you ought to tell us about your visit, Dr. Chipman?

Dr. CHIPMAN. Well, I should mention the Academy of Sciences since Senator Symington brought it up. I had the pleasure of meeting the vice president of the Academy of Sciences. He is an engineer. He tells me that the plans that are made for industrial expansion are all acted upon by a committee of the academy before they go into the overall planning of the country.

The academy is a very powerful institution. It is nonpolitical in any aspect, and it is staffed with scientific people. There are not very many members of the academy. It is quite a select group. I think 150 or 200.

They have about 300 or 350 corresponding members, who are non-political, they are scientific people, recognized for their own scientific work, and are really the scientific leaders.

This Academy of Science runs a number of institutes. You read it to us out of the book. The figure that he gave me for the total number of employees now is 50,000 employees. This is a formidable group of people.

Senator SYMINGTON. If counsel will yield to me just at that point. I think the 21,000 figure I mentioned was 1949.

Dr. CHIPMAN. It has grown since that time.

Senator SYMINGTON. I think, Mr. Chairman, those are all the questions I care to ask.

Senator JOHNSON. Dr. Chipman, is it your belief that Russia can continue or even increase its rate of progress in science and technology?

4500 METALLURGY GRADUATES TO OUR 650

Mr. CHIPMAN. I think undoubtedly they will.

Now in my own little field of metallurgy, let me tell you why. They are turning out on the average 4,500 a year of diploma graduates in metallurgy. That does not sound like a big number in all engineering but metallurgy is a specialty and there are other engineering specialties which are no doubt commensurate or bigger but compare it with our production of 650 metallurgists per year.

Senator JOHNSON. How many?

Dr. CHIPMAN. 650.

Senator JOHNSON. 4,500 and 650.

Dr. CHIPMAN. That is the ratio. This frightens me.

Certainly they can continue to advance, and the rate of advance will increase with this output of well-trained people.

Senator JOHNSON. Were you able to observe the degree of scientific and technological achievement in fields other than that of your own, metallurgy?

Dr. CHIPMAN. No; I was not. We did not get into other fields.

Senator JOHNSON. Before I conclude the questioning, I want to ask you what would be your recommendation to this committee as to what can be done about this crisis in which we find ourselves.

Dr. CHIPMAN. I know nothing about weaponry. I know nothing about rockets. I know something about basic research, and I know that it needs more support than it is getting at the present time, basic, long-range research, the kind of research where you do not know the answer when you start out.

The kind of research on which you are willing to gamble. You may get nothing or you may get something extremely valuable. The sort of research that has been sponsored in a very laudable manner by the Office of Naval Research, who have been a very intelligent agency in placing fundamental research contracts with the universities.

This sort of research needs further strengthening immediately. There is a twofold thing to be gained there, not only the increase in fundamental knowledge which comes from this sort of research, but the even more valuable aspect that this is the training ground for the graduate student in science, the student who is working for the master's degree, the doctor's degree in all fields of science, this is the training ground for that student, and we need to multiply the number of such students well above what we have at the present time.

We need also to multiply the number of undergraduate students in the sciences so that industry can be better served, and so that research can be better served by having the larger pool to draw upon.

In order to do this, we need to go back into the high schools. As Dr. Teller and Dr. Bush have both said so eloquently, we need to strengthen the science in the high schools. How do we do this?

Well, first we get some teachers who can teach science in high school. We need to improve not only the number but the quality of the high-school teachers of science.

And we need to go back further into the junior schools and lower grades and get these youngsters science conscious, get them off on the right foot so that when they get up into the high school they have enough mathematics to handle scientific study.

From my standpoint and from the basis of my beliefs, I think our educational problem is as acute as our missile problem and it is something that is going to be worse for a long, long time.

If we are to have missiles of the future, we must have education of the present.

RUSSIANS WORK 6-DAY WEEK

Senator JOHNSON. Doctor, I have been greatly impressed by your recitation of your observations. I wonder if you could tell the committee whether your impressions of Russian efficiency and their capacity and their ability were increased as a result of your visit.

Did you find more than you expected to?

Would you elaborate a little bit on that?

Dr. CHIPMAN. We found more in science than we expected to. I would not say we came away with any high regard for Russian efficiency, by and large. They have a cumbersome sort of system and the ordinary little things that are so simple to do here in this country take them a long time to do.

They work a 6-day week. That is the natural thing. Their week-end begins at 4 o'clock Saturday afternoon. They are a hard-working people. Their scientists are on the job; in fact I think the Russian people, as I saw them, were pretty hard-working people, by and large.

Senator JOHNSON. Thank you, Doctor.

So your basic recommendation is that we give increased attention to stepping up and increasing our basic long-range research.

Dr. CHIPMAN. And our education.

Senator JOHNSON. Senator Saltonstall?

Senator SALTONSTALL. Just one question, Mr. Chairman. I thank you.

Dr. Chipman, you certainly gave us a very interesting and illuminating discussion of your visit. My one question is this:

You have said in answer to Senator Johnson's question that basic research and education should be stimulated in this country.

What should the Federal Government, as such, in your opinion, do to stimulate education and basic research?

Dr. CHIPMAN. There are probably two different things. There was a bill for stimulating education a year or two ago, I believe, which had the endorsement of several very fine people. This bill encountered difficulties in the Congress and was never passed. Something like that should be reappraised.

I believe there was some difficulty that some people did not want any money to go to segregated schools. Perhaps that was a difficulty. We need the education, whether it is segregated or not, and they are two different questions.

We need those youngsters. We need for them to have good educations, and the opportunity to go into scientific work if they so desire.

So that is something that could be looked at educationwise. I do not know how one tackles a question of education from the political standpoint. I only know that the school systems everywhere need strengthening, and the more this can be done on a local basis, the better off we are.

But national leadership in pointing the way to that would be very helpful to all local communities.

From the standpoint of stimulating research, the National Science Foundation should certainly be enlarged and its budget increased—I do not pretend to know how much—but it could be doing 2 or 3 times as much as it is doing.

This, I think, without taking away from the services such valuable going concerns as the Office of Naval Research, the Atomic Energy Commission's plan of aid to the universities, and things of that sort, which are an extremely important part of our current higher education efforts.

Senator SALTONSTALL. Thank you, Mr. Chairman.

Senator JOHNSON. Senator Kefauver?

Senator KEFAUVER. Thank you, Mr. Chairman.

COMPARISON OF TECHNOLOGIES

Dr. Chipman, how many steel plants did you visit in the Soviet Union?

Dr. CHIPMAN. We visited four.

Senator KEFAUVER. Did you find they had any better technology than we did in this country?

Dr. CHIPMAN. No. It is more adapted to their needs, and different from ours. It differs in respects which you might consider minor and which are based on economics of the situation.

They are very scarce of coal of coking grades, so that all of their designs are aimed at minimizing the amount of coke required.

Senator KEFAUVER. Do they have continuous casting?

Dr. CHIPMAN. Yes, they do. We saw this in operation. They did not hold it back from us. They told us that they expect to be casting 12 million tons continuously in the next 3 or 4 years.

Senator KEFAUVER. We had some information that they use oxygen converters and planetary rolling mills. Did you find that to be true?

Dr. CHIPMAN. The oxygen converter has not come into much use in Russia. They are very much interested in it, and have visited in Canada and Sweden where these things are used, to find out about it.

Perhaps it will come in, but they are short of oxygen plants. They would like to use oxygen, also, in their blast furnaces and in their electric furnaces. But the two big plants we have visited, they have not yet built an oxygen plant. They know the use for it, but they are behind in their oxygen requirements.

Senator KEFAUVER. Did they have any planetary rolling mills?

Dr. CHIPMAN. I did not see any.

Senator KEFAUVER. Are their mills comparable to the Fairless steel plant?

Dr. CHIPMAN. No. Their rolling mills are below our standards, I would say. Their blast furnaces and open hearths, on the other hand, are fully comparable.

Senator KEFAUVER. Thank you very much.

Senator JOHNSON. Senator Flanders?

Senator FLANDERS. Dr. Chipman, do I have the correct impression from you that the technical education in the metallurgical field is up to our standards except for the fact that we do not believe in specializing so early and so narrowly? Is that the only criticism you have of it?

Dr. CHIPMAN. This is the only valid criticism I have of it. I might question certain parts of it. I think they are weak in their teaching of thermodynamics, which happens to be a little hobby of mine, and things like that. But these are questions of opinion.

Now, they give as much effort to it, it is an intelligent effort, and their program as outlined is excellent. But there is this difference of high specialization which would not be adaptable to our conditions.

Senator FLANDERS. As to the results of that education in practice, you have mentioned that in steelmaking they are doing well, but on a somewhat different basis due to economic conditions.

But in general, would you say that their metallurgical practice is high? For instance, have they developed anything like the line of alloy steels that we have?

Dr. CHIPMAN. Yes. But they do not make them in the quantities that we do. I think they do manufacture a lot of alloy steels.

Senators FLANDERS. But make them by crucibles?

THEIR ELECTRIC FURNACES INFERIOR TO OURS

Dr. CHIPMAN. These are made by electric furnaces, some by the open-hearth method. There is no crucible steelmaking anywhere in the world.

Senator FLANDERS. You see, I am getting old. It used to be, when I was a boy.

Dr. CHIPMAN. Yes. That is electric furnace production now. The electric furnaces I saw were inferior to our own.

Senator FLANDERS. But in general, their education is good except for what you say, the criticism you made of the specialization, and their steelmaking is not as fully developed as ours.

Dr. CHIPMAN. The balance is a little different than ours, I would say, but steelmaking with respect to blast furnace and open hearth is fully as developed as ours.

Senator FLANDERS. The open-hearth process is as well developed as ours?

Dr. CHIPMAN. It is as well developed as ours; yes, sir.

Senator FLANDERS. Thank you.

I have no more questions, Mr. Chairman.

Senator JOHNSON. Senator Stennis?

Senator STENNIS. Dr. Chipman, I was very much interested in all of your testimony, and impressed with it. I will be brief on my questions, which will be partly repetitious or repetition, but I was not clear.

These 4,500 graduate metallurgists per year, did you say that their education was as complete as the 650 that we graduate per year, on the average?

Dr. CHIPMAN. It is not as broad, but it is deeper and goes farther in a given direction. It is much more specialized.

Senator STENNIS. What is the extent of their general education, their broad education, as compared to ours?

Dr. CHIPMAN. Well, now, they do not lay much store by the humanities. Their humanity subjects run something like this: History of the Communist Party for 1 year; economics for 1 year; philosophy for 1 year. That is about it.

On the other hand, they do teach modern languages, which we find difficult to find time to teach to our engineers, and they are definitely ahead of us in the teaching of languages.

Senator STENNIS. Definitely ahead of us?

Dr. CHIPMAN. In the teaching of languages; yes. All of their students learn at least one foreign language, and most of them learn English.

Senator STENNIS. Most do learn English?

Dr. CHIPMAN. Yes; and it is very hard to find a student in this country who is learning Russian.

EXTENT OF SOVIET GRADUATE STUDY

Senator STENNIS. Among the 4,500 who have appreciable creative ability, has it been given a broad field of expansion and development comparable with what we would have in our country?

Dr. CHIPMAN. I do not quite understand that.

Senator STENNIS. I say, those that have creative and special ability in that group——

Dr. CHIPMAN. Yes.

Senator STENNIS (continuing). Are they given their freedom to develop and continue upward?

Dr. CHIPMAN. Yes; they are. They can come back to the institute for graduate study. After 2 years in industry, they are eligible to apply to come back to the institute for 3 years of graduate study, which is good, broadly based scientific study, as far as I can learn. It is about equivalent to our doctor of science studies.

They get a degree from this which they call the kandidat degree, which is roughly equivalent to our doctorate.

These people do broad scientific research, and write a thesis on it, and in the field of metallurgy they have about twice as many of those fellows as we have of students taking the doctorates, about twice as many.

Senator STENNIS. So within that specialized field, then, you would judge that their education was about as complete as ours?

Dr. CHIPMAN. And much more numerous.

Senator STENNIS. Yes. I know you have a greater number.

Dr. CHIPMAN. Yes.

Senator STENNIS. But the individual is just about as well educated as our metallurgist?

Dr. CHIPMAN. Roughly speaking; yes.

Senator STENNIS. Did you find freedom of thought, freedom of belief, freedom of expression among the scientists, not only among the metallurgists but the others?

Dr. CHIPMAN. Among the scientists, we did. Yes; they were free to discuss various topics. We went over as their guests. We did not want to engage in any hot arguments with them, but we did get out of bounds occasionally, and they spoke their mind, rather confidentially, to be sure.

Senator STENNIS. Yes.

Well, the feel of the thing was that they did have their freedom, and they were free to develop?

Dr. CHIPMAN. They seemed free.

Senator STENNIS. To develop and to go up, as we say here?

Dr. CHIPMAN. And they seemed relaxed, also. They did not seem to be inhibited.

Senator STENNIS. They had the atmosphere that a scientist wants, then, professionally; is that correct?

Dr. CHIPMAN. Yes, they had. And they had some good laboratories and fine equipment in which to exercise this.

Senator STENNIS. I was impressed with what you said about the friendliness of the people, and I believe you told me at lunch that you found that friendliness at every level, and what you thought would be very genuine.

RECOMMENDATION FOR EXCHANGE OF STUDENTS

Dr. CHIPMAN. May I say another word about this?

Senator STENNIS. Yes.

Dr. CHIPMAN. On this same line?

Senator STENNIS. I wish you would, sir.

Dr. CHIPMAN. We had some visitors from the Soviet Union since we were over there, and, of course, having made contact through me, I was one of the chief people who had to entertain them and take care of them, make arrangements for them.

This I found very difficult to do, because the State Department prohibits them from going here and going there. They can just go to a certain number of places.

Once you learn the ropes, steer them into these places where they are allowed to go, they get along pretty well, but they have to be accompanied by an American citizen. They are held in by all sorts of things.

We do not fingerprint them any more, but we do insist on accompanying them.

Now, I walked around Moscow quite a little bit without accompaniment, and I suppose they can in New York, but if you go to somewhere else around the country, they have to be accompanied.

I was just thinking, and was talking with some of them, about what a wonderful thing it would be if we could get to know each other better as individuals and as human beings, because they are individually just as human as we are, and individually they do not think too differently from what we think.

I suggested a plan like this: "Wouldn't it be nice if we could exchange some students, you send some Russian students over and we will send some of ours over."

"Yes," they said, "this would be fine."

Well, we thought the graduate-student level, not to get the youngsters, but somebody at least of age, say a graduate of one of our places, someone who had maybe done a little bit of research in one of our laboratories, and exchange with one of their people on equal grounds.

"Yes," they said, "and we can send you people with the knowledge of English. Could you send us some student with the knowledge of Russian?"

"Well, no," I had to admit, I couldn't send them a student that could talk Russian.

"Well, that is all right," they said. "We will set up a chair in our university for teaching people Russian who come from foreign lands, and we can take care of them. We will pay them the same number of rubles that we pay our own graduate students," which is about a thousand rubles per month, "and we will take care of them."

I found if we want to consummate this exchange to bring someone over here, the restrictions set up are practically insuperable.

For example, at MIT, we couldn't do it because Massachusetts is a closed area to Russians with the exception of Cambridge, so it would be all right to have them in Cambridge, but it would not be all right to go across the bridge.

These things that impede the interchange on a purely nonpolitical level, which would be possible if we and they would give a little bit

here and there, and we could get to know each other a little better than we do.

I think this is important, because we have been talking here about deterrents, and I think our deterrents are going to work. We ought to be doing some planning on the hypothesis that our deterrents are going to work, and that we are going to still have cold war or commercial competition or something else, as far in the future as we can see.

We ought to be planning for that, and planning in whatever way we can to alleviate it.

Senator STENNIS. You think some better understanding, then, person-to-person and group-to-group, at the level of the people, would be the best deterrent in the long run, one that would work out?

Dr. CHIPMAN. I think if we could exchange a thousand students a year with them, in the course of 10 years or so we would exchange enough people so that viewpoints would be much better understood and friction would be much less.

Senator STENNIS. I thank you very much.

Thank you, too, Mr. Chairman.

Senator JOHNSON. Senator Smith?

Senator SMITH. I have not any questions, Mr. Chairman.

Senator JOHNSON. Senator Symington?

RUSSIAN EMPHASIS ON STEEL FOR DEFENSE

Senator SYMINGTON. Doctor, back in 1950, the United States had around 90 million tons of steel. The Russians were supposed to have 18 million. Some of us were trying to raise our steel capacity. There was opposition, on the grounds the Russians only had 18 million tons of steel.

Then we looked into it, and found they were putting 50 percent of their steel into defense effort, in their own country; whereas we were supposedly putting 10 percent of ours into defense. So it was 9 to 9, on that basis.

Then, in the National Security Resources Board, we checked and found out we were putting about 3 percent of ours; so they were putting 9 million tons into defense and we were putting in less than 3 million tons a year.

That was just before the Korean war. I understand now that, whereas our production capacity is 120 million, theirs has grown to 50 million; is that about right?

Dr. CHIPMAN. I think it is a little bit on the high side, but it is growing.

Senator SYMINGTON. What would you say it is?

Dr. CHIPMAN. I think it is slightly under that, but my statistics and my ability to remember statistics is a little poor.

Senator SYMINGTON. You were impressed with their metallurgical development?

Dr. CHIPMAN. Definitely, and their rate of growth.

PROGRESS ON ENGINE HEAT PROBLEMS

Senator SYMINGTON. It might interest you to know that one of the generals on the Twining Moscow mission a year ago last June, perhaps the best production man who went over, said that what he was the

most impressed with of anything he saw, was their metallurgical development. This except their plans for the education of youth.

Dr. CHIPMAN. Yes.

Senator SYMINGTON. In 1948 there was an argument between ourselves and another country about a jet engine, as to whether they had or had not sold that engine to the Russians. So, we asked the Chief of Staff of the Air Force, when we got our first MIG-15 what engine was in it. When we did shoot one down, we found it was that engine in the MIG-15.

The point about this is that General Vandenberg told me then, nearly 8 years ago, that they had worked out, in production, in their engine, some metallurgical problems we had not worked out in our laboratories.

Is that the type and character of development that you were referring to?

Dr. CHIPMAN. It could be. There are variations in the kinds of alloys you use in a high-temperature jet engine.

Senator SYMINGTON. Yes.

Dr. CHIPMAN. It is my impression from talking to the metallurgists there, they are using approximately the same type of alloys the British are using.

Senator SYMINGTON. Did you use the word "Bessemer?"

Dr. CHIPMAN. It is used.

Senator SYMINGTON. I mean did you use it a minute ago?

Dr. CHIPMAN. No.

Senator SYMINGTON. How do they make their steel? Mostly in open hearth, basic?

Dr. CHIPMAN. It is mostly open hearth basic steel.

Senator SYMINGTON. What are most of their alloys, electrical steel?

Dr. CHIPMAN. Electric furnaces.

Senator SYMINGTON. Did you see any of the furnaces?

Dr. CHIPMAN. Yes; we saw them.

Senator SYMINGTON. What were the largest sizes?

Dr. CHIPMAN. They were not to compare with yours. The largest size we saw was something like 15¹ tons. That is a small furnace today.

Senator SYMINGTON. Did you go into any foundries?

Dr. CHIPMAN. Yes; one foundry.

Senator SYMINGTON. Are they doing any permanent mold casting or sand?

Dr. CHIPMAN. No. There was ordinary sand casting, green sand casting.

Senator SYMINGTON. What you are really saying is that they are progressing but they are behind us in technology; is that correct?

Dr. CHIPMAN. In certain things they are behind us, but they are not one inch behind us in the blast furnace development.

Senator SYMINGTON. In the making of pig iron?

Dr. CHIPMAN. Blast furnace, which is the basic tool of the industry.

Senator SYMINGTON. You mean in the making of their pig iron?

Dr. CHIPMAN. In the making of their pig iron; that is right.

Senator SYMINGTON. Do they pour it into the open hearths liquid or solidify it?

Dr. CHIPMAN. They pour it in liquid.

¹ Later reference to notes indicates 30 tons. Still a small furnace.

LOW RATE OF STEEL PRODUCTS REJECTION

Senator SYMINGTON. Now, a general testified that when he was over there he saw a job we would put on a turret lathe, but they were doing it on a hand lathe. The worker said he had been doing this same job for 12 years. They had no inspector, because if one made too many parts wrong, they put their initials on them, they knew where they would go. He said, nevertheless, those parts from that old lathe went into the finest radial jet engine he had ever seen.

In other words, they make a good product. Is that what your opinion is?

Dr. CHIPMAN. They make good products. They do not reject much.

Senator SYMINGTON. They make a good product despite their relatively old machinery; is that it?

Dr. CHIPMAN. I suppose so. I had no opportunity to gage the quality of the machine product.

Senator SYMINGTON. I see. You just looked at the production of steel itself.

You talked to Senator Stennis about the nature of their training in metallurgy. You said, in effect, that they make the students specialize more—

Dr. CHIPMAN. Much more.

Senator SYMINGTON (continuing). In a particular part of metallurgy?

Dr. CHIPMAN. A very particular and rather narrow part of metallurgy, and they go into this in great detail, great lengths. They do a lot for those boys which we would expect our students to get after they have gone out into industry. But they expect this because their youngsters go into industry and are expected to fit into a job and know what they are doing. And they very soon become foremen and are promoted to superintendents. They do not promote anyone from the ranks. You have to be a metallurgical engineer in the steel industry in order to get to first base. There is no such thing as the office boy becoming president, or the steel roller becoming general manager. It does not happen.

Senator SYMINGTON. Did you see any of their sheet and strip mills?

Dr. CHIPMAN. There was one narrow strip mill.

Senator SYMINGTON. Automatic or hand?

Dr. CHIPMAN. Automatic.

Senator SYMINGTON. Of strip or sheet?

Dr. CHIPMAN. Strip.

Senator SYMINGTON. How about plate? Did you see any plate mill?

Dr. CHIPMAN. I did not see any plate mills.

Senator SYMINGTON. They must have a number of plate mills based on the number of tanks they build.

Dr. CHIPMAN. That is right.

Senator SYMINGTON. Did you see what you asked to see, or what they permitted you to see? A lot of people go over there, and come back impressed.

Dr. CHIPMAN. They asked us what we wanted to see, which was for us the steel- and iron-making facilities, the ore, the coke, the sintering, everything that goes into steelmaking.

Senator SYMINGTON. So you were interested in the pouring really, not in the rolling?

Dr. CHIPMAN. That is right; that is my chief interest, and that is why I saw it.

We saw a little of rolling. We saw some forging presses. But we did not attempt to go into that as thoroughly.

Senator SYMINGTON. Steel forging presses?

Dr. CHIPMAN. That is right. Regular forging presses. We saw at Sverdlosk a four and ten thousand ton press in the same plant.

Senator SYMINGTON. Thank you, Mr. Chairman.

Senator JOHNSON. Senator Case.

Senator CASE. Mr. Chairman.

Dr. Chipman, I noticed you referred to the types of plants that you saw, the steel plants. You said one of them was practically new.

Did you see any steel plants brought in from Germany during the dismantling period?

Dr. CHIPMAN. No, we saw none which were identified as such.

Senator CASE. In 1947, I was in Germany as a member of a congressional committee, and we made a report then on dismantling, and I remember one item was a large steel plant from Essen was being moved to Russia.

Dr. CHIPMAN. I know they brought in a lot, but we saw nothing.

Senator CASE. Your observation is now, at least, they are establishing plants on their own?

Dr. CHIPMAN. The things we saw were of Russian manufacture. If they had a nameplate on it, it was in Russian. This does not mean very much, of course. It is easy to replace a nameplate.

RECOMMENDS START OF EXCHANGE AT GRADUATE LEVEL

Senator CASE. I was very much interested in your remarks about the attitude of the Russian people and the students. It is entirely possible that in your observations on what will happen after our deterrents have worked and we have reached the stage where we do not get into war but we still have this long-range problem of living on the same planet, would you recommend a student exchange program below the high-school graduate level?

Dr. CHIPMAN. My thought is that it should start at the level of graduate students, people who have got their bachelor degree.

Senator CASE. People who have graduated from college?

Dr. CHIPMAN. People who are in the graduate school. That is to say, exchange of graduates, people perhaps working for a doctor's degree. That would be the level at which experimentation would be begun.

Senator CASE. Would you recommend a visit to Russia by every Member of Congress?

Dr. CHIPMAN. No, sir; I do not know that I would go that far. But it is quite interesting, I can tell you.

Senator CASE. Well, do you think it would be profitable for the average Member of Congress to personally visit Russia?

Dr. CHIPMAN. I think it would be very enlightening, yes. My own thoughts on the matter were considerably changed by my visit.

Senator CASE. That is all, Mr. Chairman.

Senator JOHNSON. Thank you, Senator Case.

Senator Bush.

Senator BUSH. No questions, Mr. Chairman.

Senator JOHNSON. Thank you, Senator Bush.

Senator Barrett.

Senator BARRETT. Just one question.

How many of the graduates in metallurgical engineering were girls?

Dr. CHIPMAN. It is about 20 percent at the present time.

Now, they think, the teachers that I talked to thought that this 20 percent is perhaps a little too high, but steps are being taken now to give preferences to students who have had 2 years of military service or 2 years of industrial experience, and they feel that this granting of preferences here to these 2 categories will undoubtedly diminish the proportion of women.

Senator BARRETT. Women, girls graduating over there in that type of engineering numbered more than all of the students graduating in that field in this country. I think you said it would be 900 for Russia, and 650 for the United States.

Dr. CHIPMAN. Your arithmetic is good.

Senator BARRETT. Were there any girls graduating in this country in metallurgical engineering?

Dr. CHIPMAN. Perhaps 2 or 3.

Senator BARRETT. Does that same percentage apply in all types of engineering colleges?

Dr. CHIPMAN. In engineering, I think it perhaps does. In the sciences, there would be a larger proportion of women.

Senator BARRETT. What is the reason we do not encourage the girls to go into that?

Dr. CHIPMAN. Pardon?

Senator BARRETT. I say what is the reason we do not encourage the girls to go into that type of engineering or any type of engineering?

Dr. CHIPMAN. I have never discouraged one from going into metallurgy. I do not know who does the discouraging.

Senator BARRETT. Well, we have not been successful in interesting them in that.

Dr. CHIPMAN. No, we have not. They are more likely to go into chemistry or biology.

Senator BARRETT. Thank you very much, Mr. Chairman.

Senator JOHNSON. Has counsel any further questions?

Mr. WEISL. No further questions.

Senator JOHNSON. Does any Senator desire to ask any other question?

Dr. Chipman, on behalf of the committee, I would like to express our gratitude to you for coming here and being helpful to us.

The hour is late and it is a tribute to your patriotism and to your desire to serve that you traveled so far to give us the benefit of your knowledge.

You have had a very unusual experience and you are in possession of what is probably the most precious information on an important segment of Russian industry. It is a segment which relates specifically to a subject of this inquiry.

The record we have made today is an excellent one. I think that this will be a very memorable day in the scientific life of our country. We have had an opportunity, at least for 1 day, for the scientists to take over a committee of the United States Senate and to speak to

this country and the people of the world and give them constructive suggestions.

Your contribution along with Dr. Teller and Dr. Bush has been of great importance to us. On behalf of the committee, I thank you, and I hope that we can feel free to call upon you from time to time as this study progresses.

Dr. Chipman, I think it is very safe to say that it is men of your caliber upon whom the future of this country rests, and I am very honored to have been in your presence.

Thank you so much for coming and being with us.

The committee will take a recess until 10 o'clock tomorrow, at which time we will hear Dr. Hagen, General Doolittle, to be followed in executive session by Mr. Allen Dulles.

The committee will recess at this time.

(Whereupon, at 6:30 p. m., the committee recessed to reconvene at 10 a. m., Tuesday, November 26, 1957.)

INQUIRY INTO SATELLITE AND MISSILE PROGRAMS

TUESDAY, NOVEMBER 26, 1957

UNITED STATES SENATE,
PREPAREDNESS INVESTIGATING SUBCOMMITTEE
OF THE COMMITTEE ON ARMED SERVICES,
Washington, D. C.

The subcommittee met, pursuant to call, at 10 a. m., in room 318, Senate Office Building, Senator Lyndon B. Johnson (chairman of the subcommittee) presiding.

Present: Senators Johnson (Texas), Kefauver, Stennis, Symington, Bridges, Saltonstall, and Flanders.

Also present: Senators Byrd, Smith (Maine), Case (South Dakota), Barrett, and Bush, members of the Committee on Armed Services; Senators Carroll and Dirksen.

Edwin L. Weisl, special counsel; Cyrus R. Vance, counsel; Gerald W. Siegel, associate counsel; Solis Horwitz, associate counsel; Daniel F. McGillicuddy, Jr., associate counsel; Stuart P. French, associate counsel; George Bunn, associate counsel; Edwin L. Weisl, Jr., assistant special counsel; Dr. William V. Houston, consultant; Dr. Homer J. Stewart, consultant; and Dr. Edward C. Welsh, staff adviser.

Senator JOHNSON. The committee will come to order.

The committee plans to hear today Gen. James Doolittle, Dr. John Hagen in the morning session, and Director of CIA Allen Dulles, in the afternoon session. We do not plan an evening session.

On Wednesday, beginning at 10 o'clock, we will hear the Secretary of Defense, Mr. McElroy; the Under Secretary of Defense, Mr. Quarles; and then Mr. Holaday.

We do not plan an evening session tomorrow evening, if we can conclude with those witnesses. If we have not completed with their testimony, we will have an evening session.

The committee will then take a recess until December 13.

In the meantime, the staff will make preparations for our witnesses to be heard in open session on the 13th, 14th, 16th, and 17th. If we are able to conclude with the witnesses that are ready to testify at this time, we will conclude the hearings on the 17th until after the Christmas holidays.

If we have not finished with hearing the witnesses ready to testify, we will continue on the 18th, possibly the 19th.

Immediately after the first of the year, we will continue with further hearings. I want to make it abundantly clear there has been no time limit set on the hearings. The authority of the committee does expire at the end of January, but we plan to proceed as expeditiously as we can, cover as much ground as is possible. This is not a situation that permits us to dawdle around and take things in our stride. We are going to be expeditious, but we are going to try to be thorough,

and there have been no limitations set on the number of witnesses or the number of days we will have open hearings.

We will hear as much as possible in open session. If a security question arises, we will go into closed session.

Our first witness this morning is a man who bridges three careers, scientific, industrial, and military. In all three, he has served with high distinction.

Gen. James Doolittle needs no introduction, either to this committee or to the American people. I shall recount his biography only for the sake of making the record of this hearing complete.

General Doolittle is a native of California. He received his bachelor of arts degree from the University of California in 1918, his master of science degree from Massachusetts Institute of Technology in 1924, and his doctor of science degree from the same institution in 1925.

He was an aviator in the United States Army from 1917 to 1930, when he resigned to accept a position with the Shell Oil Co. He was with that corporation until 1940, when he returned to active duty with the Army Air Corps.

During the Second World War he commanded the 12th Air Force in north Africa, the 15th and 8th Air Forces.

He commanded the latter on Okinawa when the war ended in 1945. He returned to inactive duty and his employment with Shell Oil Co. in 1946.

General Doolittle, there are many reasons for calling you before this committee today. You have a distinguished scientific background. You have practical production experience. You hold the highest military award that the country grants to any man, but there is another reason which, to me, is extremely important.

In 1942, our power in the Pacific was gone. Battleships, shore installations, and forts were merely ruins of twisted steel and shattered concrete. We were powerless to halt the advance of an enemy, and American humiliation was quite complete.

Suddenly came the news of the bold, audacious raid over Tokyo. In our darkest hour up to that time, you led Americans to the attack, the attack right at the heart of the enemy. The news electrified the country.

Our people became buoyant and confident and ready to take on any task, no matter how big or how dangerous. The difficult became something to do immediately. The impossible became something that might take a little time.

Once again we Americans are faced with tasks that are difficult, and that seem impossible. We have called upon you today for your views on how the difficult can really be done, and how the impossible can be done in a little time.

General Doolittle, it is a very great pleasure to have you with us today, and now, will you stand and raise your right hand, please?

We have a custom of swearing each witness. Do you solemnly swear that you will give this committee the whole truth and nothing but the truth?

General DOOLITTLE. I do.

Senator JOHNSON. Mr. Weisl, will you proceed?

**TESTIMONY OF JAMES H. DOOLITTLE, CHAIRMAN, SCIENTIFIC
ADVISORY BOARD**

Mr. WEISL. General Doolittle, as our chairman, Senator Johnson stated, you are in a unique position to help this committee and to properly inform the American people. About one-half of your career has been spent in the military field, and the other half has been spent in a business and civilian career.

May I ask you, General, whether you serve on any committees connected with the defense and the preparedness of the United States?

General DOOLITTLE. Yes, Mr. Weisl; I serve on several governmental committees, and am chairman of three.

Mr. WEISL. What committees are you chairman of, General?

General DOOLITTLE. I am Chairman of the Air Force Scientific Advisory Board, Chairman of the National Advisory Committee for Aeronautics, and Chairman of Governor Stassen's Air Inspection Panel.

Mr. WEISL. Have you been appointed on some of these committees by the President of the United States?

General DOOLITTLE. Most of them, sir, are Presidential appointments.

**RUSSIA'S RATE OF PROGRESS AND GROWTH SURPASSES THE UNITED
STATES**

Mr. WEISL. Are you familiar with the testimony which was given yesterday by Dr. Teller and Dr. Bush?

General DOOLITTLE. I read some of it in the papers. I had breakfast with Dr. Teller this morning, and he discussed his testimony.

Mr. WEISL. Do you agree, generally, with Dr. Teller?

General DOOLITTLE. I do.

Mr. WEISL. Do you agree that we are behind Russia in military preparation?

General DOOLITTLE. Yes.

Mr. WEISL. Do you agree with Dr. Teller that the Soviet Union is either ahead of us or about to catch up to us and surpass us in science and technology?

General DOOLITTLE. I believe that the rate of Russian progress is much more rapid than ours; that, in some areas, she has already passed us. If the rate continues, she will pass us in all.

Mr. WEISL. Do you wish to make any further comments on those subjects?

General DOOLITTLE. I might speak a little about why the Soviets are ahead of us in some aspects of missiles. I say "some" aspects because I am not sure she is ahead in all.

There are, as you know, four types of missiles—surface-to-surface, surface-to-air, air-to-surface, and air-to-air.

In the air-to-air missile, there is considerable question as to whether she is ahead of us, whether she has a missile to shoot from one air-plane at another as good as our Falcon or as good as our nuclear-warheaded air-to-air missile.

However, in the field of long-range missiles, surface-to-surface missiles, IRBM's and ICBM's, she is certainly ahead of us.

I think there are several reasons for that. One reason, and, perhaps, the primary reason, is that she started sooner. She started in 1946, and we did not start a coordinated effort until 1953, 7 years later. She has been at it 11 years; and we, 4.

I think a second reason is that she is working harder than we are; even in her schools she works harder. They have a system known as the double-incentive system. I do not advocate it. Here we have a single-incentive system. In Russia, you are rewarded for excellence, and you are destroyed if you do not do a good job.

I believe the third reason she is ahead is because she is sacrificing more than we are. She has a true arms economy. We have, I am afraid, something of a butter economy.

Economists estimate that about one-fourth of Russia's gross national product goes into her military. In our case it is about $8\frac{1}{2}$ percent, or roughly one-third as much relatively.

I may appear to wander afield a little next, but I would like to point out some of Russia's advantages.

One is that she has a definite, clear-cut objective. This objective is world communization and world domination. She has a long-range, flexible, consistent plan for the achievement of that objective.

The series of 5-year programs that she has carried out to implement the plan have been programs of militarization, industrialization, and education. I am sure that the military people have or will tell you about her military program.

The members of the various industries keep closely in touch with her industrial program, and while figures are difficult to confirm, economists and geopoliticians estimate that her industrial base in 1947, just 10 years ago, was one-seventh of ours, that now it is about one-third of ours, and that it is increasing twice as fast.

Her gross national product is about one-third of ours, and is increasing half again as fast.

MUST OVERHAUL OUR EDUCATIONAL SYSTEM TO CATCH UP WITH RUSSIA

Only lately have we come to realize that the primary foundation upon which their new technology is built is their excellent educational system.

Their excellent educational system and their appreciation of the value of science are largely responsible for their rate of technological progress, and for the fact that in some areas they are ahead of us.

In order for us to catch up, I am satisfied that we must overhaul our own educational system.

There are definite educational needs. We need more classrooms, particularly in the secondary schools. We need more science teachers. We need better science teachers. Certainly some of our science teachers are dedicated people, but many of them are not versed in science, not able to teach it properly, and certainly not able to make it live so it is an interesting subject and elicits the interest of the young high school people.

Certainly the scientist and the educator must be given more prestige, and I touch on a delicate subject, more pay.

A Russian scientist professor gets roughly 50 times as much as a day laborer. Here in many cases they do not get as much.

Certainly we must give more kudos, more encouragement, more praise, more honor, if you will, to the science students.

To catch up with Russia, the American people have to be alerted to the threat. The one good thing that sputnik did was to start that awareness.

The basis of the threat is the Soviet excellence in science and technology. Certainly they are ahead of us in some areas; as I said earlier, they are catching up in others, and the real threat is their rate of progress. Their rate of progress is much more rapid than our own.

The thought is sobering, but in no sense hopeless, but there is no room for complacency. We must develop a sense of urgency. We must be willing to work harder and sacrifice more. We must increase the goods produced per man-hour, probably work longer hours.

We would like to balance the budget, cut military expenses, reduce taxes. Russia won't let us.

URGENCY IN MEETING DEFENSE REQUIREMENTS—INCREASED SPENDING

Mr. WEISL. General, you have told us about the more or less long-range program that we must engage in in order to keep up and surpass, if possible, Russia's rate of growth and achievement. Can you tell us something about the immediate problem that faces us?

General DOOLITTLE. Yes, sir.

It is difficult to separate our immediate problem and our long-range problem and the programs that we must have to implement them.

I would certainly start by saying that we must maintain a strong, modern military defense establishment, because the only thing that Russia respects is strength.

In order to say what we have to have in that Military Establishment, I must first disqualify myself as far as the Army is concerned. I am not knowledgeable on their requirements, and I merely say that they should have what they need to do their job.

I know a little more about the Navy, and obviously submarines, antisubmarines, and submarine missiles, are a part of the Navy's program, and they should have what they require in order to carry out those programs.

On the Air Force requirements, I am somewhat more knowledgeable, because I have been 40 years in aviation, having started in 1917 and been associated with it continually ever since.

Certainly the primary requirement, as far as the Air Force is concerned, is a strong Strategic Air Command. This is our basic deterrent, and it is the agency that would be obliged to win a war if we cannot deter a war.

They must have sufficient aircraft; and now the number they have, I should say is skimpy.

Mr. WEISL. Is what?

General DOOLITTLE. Skimpy.

They must have missiles as fast as they are developed and can be fed into the inventory. They must have adequate crews, both air and ground, to fly the aircraft and to maintain them.

They must have sufficient airfields in order to permit the maximum efficient dispersal. There must be some base hardening of those airfields so that a sneak attack could not put them all out of commission.

They must be on maximum alert, and must have the facilities required to permit maximum alert.

The Air Force is now striving toward having one-third of their force on alert at all times. They have not yet achieved this, and it should be achieved with all possible expedition.

They must have enough money for gas, oil, spares, the so-called O. and M. funds, in order that they can obtain and retain a sufficient amount of training.

My own personal experience is, I flew for 30 years. During that time I averaged roughly an hour a day. As I got tied down to a desk and found it impossible to fly as much as I should like, I quit when I couldn't get 20 hours a month.

In some categories, our Air Force is getting 5 hours a month to fly in. This is far too little to maintain the proficiency required. We must be more generous in this particular aspect, which fortunately is not a particularly costly one.

I would like at this point to point up the complexity of the modern airplane. I think the simplest way to point it up, and speaking in round figures and not endeavoring to be precise, because every airplane costs a little more or a little less, according to the number you make, and so forth, but just order of magnitude on complexity.

In World War I, a fighter plane cost about \$5,000. In World War II, about \$50,000. In the Korean war, around \$500,000.

The new long-range Mach-3 interceptor presently being considered will cost several million, say 5 million.

So you have in this period of time gone from a weapon that cost a unit of 1, to a unit of 1,000 times that much.

I think that points up more forcibly than anything that I can say the increased cost of the Military Establishment, and that complexity goes into the maintenance and operation, as well, so it points up the increased importance of continuing to have our crews always trained and alert. So much for SAC.

Mr. WEISL. General, may I interrupt?

General DOOLITTLE. Yes, sir.

Mr. WEISL. Before we leave SAC, you have told us what the Strategic Air Command needs to reach its maximum and necessary—

General DOOLITTLE. No, sir.

Mr. WEISL (continuing). Efficiency.

General DOOLITTLE. No; not to reach its maximum. There is no way we could afford to have it reach its maximum. But to reach its optimum.

Mr. WEISL. But to reach its optimum.

Could you tell us what they have at the present time, without violating security?

General DOOLITTLE. Would you mind, Mr. Chairman, if I deferred that to the military people, who are far more knowledgeable on that particular question? I will merely say, in my mind, they do not have enough.

Senator JOHNSON. Very well.

Mr. WEISL. Can you give the committee any suggestions or any advice as to how they can be helpful in seeing that they do get enough?

General DOOLITTLE. Well, this committee is doing, in my mind, the most important job right now that can be done, and that is, assisting in the alerting of the American public to the threat that we face, and I am quite sure that an alerted American public will react properly

and will support the legislation and the administration in the things that they have to have and they have to do.

Mr. WEISL. General Doolittle, you agree, do you not, that we may not have the time that we had in the First and Second World Wars to get ready?

General DOOLITTLE. Well, certainly the big change that has taken place in the military is a change in the effectiveness of our weapons systems. In all past history, there has never been a revolutionary change in weapons. Every advance in weapons has caused a change in our system. Today, we have a revolutionary weapon in the thermonuclear bomb which changes our entire concept, and our ability to concentrate firepower in time and space means a great many things. We are not going to have time. Our decision—I was coming to some of these later.

Mr. WEISL. Very well.

General DOOLITTLE. But your decisionmaking must be very quick indeed. We do not have time to vacillate and will not have time in the future. I was going to come next to the air-defense part of the Air Force's mission.

Certainly we must have improved radar, improved capability of detecting aircraft at low altitudes, improved radar at high altitudes, extensions of the seaward arms, a rapid development and installation of the SAGE system, which is presently lagging. Our air defenses are dependent on it.

Certainly there must be some improvement in and augmentation of our fighter aircraft, immediate improvement and augmentation of our missiles, and we should start at once on an anti-ICBM program, both the passive phase, that is, the detection phase, and the active phase, that is, the destruction phase. We have been going at this slowly, considering it. The time has come now when we must go full out. Above all things, we have to go at a higher rate. We have to speed up.

In TAC, certainly the Air Force should furnish what the Army requires in fighters and reconnaissance, and in transports. In my mind, a certain element of the Army should be mobile. It should be able to go any place in the world in a matter of hours. It should be able to take its organic equipment with it, and it should be suppliable by air over an indefinite period. All of this adds up to an immediate substantial increase in our military budget.

Mr. WEISL. General Doolittle, you have spoken about the number of hours that an airman has in the air. What are the proper number of hours that an airman ought to have the air to be ready and prepared?

General DOOLITTLE. I wanted to be able to fly any type of airplane, any time, any place, and I considered that when I did not get 20 hours a month, I was no longer able to fly in that way safely.

Mr. WEISL. How much more than 20 hours would you say is needed? I don't expect you to be precise, of course, but I think the committee would like to get some idea.

General DOOLITTLE. I do not think that question can be answered precisely, because it depends upon the job that has to be done. It depends upon the individual. But I certainly feel that enough money should be provided so that those people in charge are able to operate a training program adequate to keep our military organization at maximum effectiveness.

Mr. WEISL. Would you say that at the present time they are not getting enough help to do this

General DOOLITTLE. I said that—the Air Force is obliged within its budget to do those things that they consider most important. As a result of that, some of the things that should be done are not done strictly due to budgetary limitations.

My answer to your question is that the Air Force needs more money. I am not qualified to say what the Navy and the Army need because I am not knowledgeable in those areas.

Mr. WEISL. Have you any suggestions to this committee—

AGGRESSIVE RESEARCH AND DEVELOPMENT PROGRAM NEEDED

General DOOLITTLE. I did not finish my answer to your last question, sir.

Mr. WEISL. I am sorry, sir.

General DOOLITTLE. I got off, when I said what should we do now, I got off on what I considered was the important things to do as far as our Military Establishment is concerned.

I feel also that we must have an aggressive research and development program. We must specialize in basic research, in the acquisition of fundamental knowledge. We must learn more about our planet, we must learn about meteorology, oceanography, geology; we must also learn about outer space.

Here again we require a sound educational program to supply the future scientists and technologists necessary to carry out that program.

I think there should be some relaxation of our present security regulations in order to permit the greater dissemination of information. In the past we have considered that we must not let Russia get any of the secrets that we had. We have since found out that she already has many of those secrets, and that we were penalizing ourselves and our allies by not making more of our scientific information generally available. Because a group of scientists, through discussion and through cross-fertilization of ideas can greatly speed up the rate at which they develop new concepts, and this is extremely important. I feel that we must give more information to the public, more information to our allies. The old rule in general was that we should give out no information that would be of comfort or value to the Russians.

I think the new rule should be that every bit of scientific technical information should be disseminated to our public and to our allies where the dissemination of that information does not do Russia more good than it does us. This will permit a very considerable opening up of our security regulations.

Fifth, I think that it is simply imperative that we maintain a sound economy, that is, we must consider economy in our Military Establishment as well as effectiveness, because this cold war may last a long time.

It is going to last, I am sure, until people change. It may last 1, 5, 10, 50, or 100 years. We have got to be prepared to go along that long.

And last, and not least important, I feel that we must develop and maintain a high degree of morality. That was in answer to your question, what should we do now and in the future.

Mr. WEISL. Well, you have emphasized, as have the other witnesses, that one of the primary needs is to provide enough funds and enough staff to do intensive basic and applied research.

In that connection, I have had several talks with Senator Russell, Senator Johnson, Senator Bridges, and others, and they have told me that any request for basic or applied research that has been made to the Senate has been granted, and in many respects increased.

Do you know of any area—

General DOOLITTLE. At the beginning of this meeting, sir, I advised that I was Chairman of the National Advisory Committee for Aeronautics, a research organization that is charged with the acquisition and coordination of information necessary to keep us ahead in aviation.

Mr. WEISL. Yes, sir.

General DOOLITTLE. I am very grateful to learn that we will get the funds that we need to do our job. [Laughter.]

Mr. WEISL. Sometimes, General Doolittle, when the funds are appropriated, they may not be used.

General DOOLITTLE. That is correct.

Mr. WEISL. And some of the complaints that have been made to my staff and myself in that connection are these: the money is appropriated, then it is stretched out, the research is started and then stopped and then started and then changed and then restarted again.

Have you any comment on that sort of a program in dealing with research?

General DOOLITTLE. I might comment on that by saying that I believe that we people of America have two instinctive traits.

One of them is impatience. Impatience is both good and bad; impatience sometimes makes us dissatisfied with the status quo and is responsible for much of our progress. It certainly is bad when we are dealing with the Asiatic who has infinite patience. We become impatient and he outwaits us.

Another American trait is an unwillingness to accept the unpleasant until we are hurt. When we are hurt enough we react soundly, but frequently, we fail to take preventative action and have to take remedial action.

In the case of air traffic, the aviation fraternity knew that the air traffic was becoming overloaded, that accidents were bound to happen.

Even the press took the question up and the public was acquainted with the great number of near collisions, and still nothing was done about it until we had an accident over the Grand Canyon in which a TWA and United plane crashed with all aboard lost.

Then we began to take immediate action.

I believe that this inherent American trait is responsible for many of our problems. We incline to operate like a pendulum. We are over on one side, very enthusiastic. We are over on the other side, very dejected. We seldom stop right in the middle. This has been reflected in our national policies. It has been reflected in our budget. If you observe the Russian budget, it has gone steadily upward since 1945 at the end of the war.

Our budget went down to almost nothing, went up again to a peak in Korea, came down, went up. Our budget goes up whenever Russia frowns and it goes down whenever she smiles, and this puts us at a distinct disadvantage because you cannot turn off a technical project, a research project, a development project, a production project

like you turn off a faucet and then turn the faucet back on when you want to.

You lose people, you lose time, you lose money.

Mr. WEISL. Have you any suggestions as to what this committee or the Senate or the Congress can do to see that we do not indulge in this turning on and turning off process?

General DOOLITTLE. I believe that the hearings that you are having will be very helpful in pointing out some of the faults in our present system.

WAYS AND MEANS OF IMPROVING MILITARY METHODS AND ADMINISTRATION

Mr. WEISL. General Doolittle, you had considerable experience in the Military Establishment, its ways of getting things done, the various duties that the Joint Chiefs of Staff have, the duties and powers that the Secretary of Defense has.

Can you tell this committee anything that might help them in seeking ways and means to improve the methods and the administration of the Military Establishment?

General DOOLITTLE. This is a very difficult question indeed, and I am neither prepared nor competent to answer it in full.

I would like to point out that it is easier to see faults than to see the proper remedial action that should be taken to correct those faults.

There are certain things that have happened that have made our Military Establishment, which I consider as good, not perfect.

The first of those I briefly spoke of, and that is a truly revolutionary weapon has been added.

Nuclear weapons have increased the ability, our ability to concentrate firepower in time and space in the order of a millionfold. This has been followed by entirely new concepts for the use of weapons systems.

I do not believe that the present system is properly designed to employ with maximum effectiveness and minimum cost some of our new weapons and concepts.

I believe that some changes are required. Some can be made without legislation, some will require legislation.

I believe that the changes must be evolutionary, not revolutionary. Certainly at this time, we must not upset our Military Establishment and even momentarily assume a position of weakness.

There is much that is good in our present system.

As a matter of fact, most of the things are good. They should certainly be saved, and in correcting faults we must be sure that we do not introduce new and more difficult problems.

We must be very careful that the cure is not worse than the disease.

Certainly we should eliminate wasteful duplication. I do not believe that all duplication is wasteful. But we must eliminate wasteful duplication.

We must eliminate destructive competition, and again I do not believe that all competition is destructive—all competition is destructive, there is competition that is good.

I do not know—it may be that we are headed toward a single service in one uniform. I do not advocate it at this time, because I have not had an opportunity to study the entire matter through to conclusion.

I do know that the operating commands must not be interfered with by the three individual services in any way that makes it more difficult for them to do their jobs.

I do know that a joint task force should be truly a joint task force with loyalties to getting the job done and not loyalties to individual services.

I do know that decisions must be rapid. Rapid decisions will save money, will save time, and it is quite possible in the light of today's highly destructive weapons that some day a rapid proper decision may be the difference between survival and our not surviving.

It would seem to me, therefore, that this decision making must be thought of at this time.

A first step, it would seem to me, would be to strengthen the office of the Secretary of Defense. It seems to me that he should be provided with an advisory military staff to assist him in resolving the honest differences of opinion that now occur between dedicated military people.

It is very difficult for a civilian who has recently come in from civil life to cross a dedicated military man who has devoted his entire life to the work in which he is engaged.

I therefore feel that a staff of military advisers in the Office of the Secretary of Defense is called for now, and is a natural first step in whatever changes need to be made in our Military Establishment.

I would like to suggest that before any change is made in our Military Establishment that the matter be studied very carefully with an extremely competent board of people, knowledgeable in the legal aspects, the administrative aspects and the military aspects of our Defense Department.

Mr. WEISL. General Doolittle, I think that your suggestion of an operating staff to advise the Secretary of Defense ought to be clarified. He now has a military staff, does he not?

In what respect would your plan of a general military staff for the Secretary differ from the Joint Chiefs of Staff, for instance?

General DOOLITTLE. I believe that the Joint Chiefs of Staff concept is sound but at present it has one handicap, and that is that the Joint Chiefs of Staff represent both the overall military program, and their obligation as head of their service.

Frequently, the Joint Chiefs of Staff do not come to a unanimous conclusion. I do not believe that in this time of crisis, that we can tolerate delays in arriving at the best possible solution of our military problem.

Mr. WEISL. Would not the military—and I am asking this for clarification only, General—would not the military staff of advisers that you suggest be drawn from the different services and would not they each come with a prejudice, so to speak, for want of a better word, in favor of their particular service?

General DOOLITTLE. They should be drawn from young progressive people who have had insofar as possible, experience in all three services. They would have the advantage over the Chiefs of Staff that they are not, none of them would be head of any one service.

Mr. WEISL. Would these men make service on this general advisory staff their career, or would they serve for a time and then return to their particular service?

General DOOLITTLE. They would certainly serve initially for a period of time and then go back to their individual services, where their service on the staff would be remembered. [Laughter.]

Mr. WEISL. But, General—if they were on this advisory staff, advising the Secretary of Defense, knowing that when they gave this advice they would have to go back to their particular service and if they gave advice, to put it bluntly, that their particular service did not like, would not they be in a position to be rewarded or penalized?

General DOOLITTLE. That would be a determinant. It would be a handicap, but in my mind not an insuperable one.

Mr. WEISL. How would we overcome that to make sure that this general staff was a career staff, and would have the interest of the military as a whole in mind, rather than the interest of a particular service?

General DOOLITTLE. Some day, I believe that we will have to have an old type general staff, with a head. This at the present time may not be ready, we may not yet be ready for that, because there is a great fear, which I consider unwarranted, of a military hierarchy.

But some day, we are going to have to have the means of coordinating our planning, and our operations and doing it on a more rapid basis than we are able to do it today.

Then you would have just what you speak of.

Mr. WEISL. Why could not we have an advisory staff of young, vigorous knowledgeable men who would make a career of permanently being an advisory staff to the Secretary, so that they would have nothing in the back of their minds concerning the rewards or punishments that they might receive after they return?

Why should they have to return to their particular service?

General DOOLITTLE. I believe that is a very desirable thing. I question whether it can be sold at the present time.

Mr. WEISL. Why not?

General DOOLITTLE. Because there is on the part of people and the American public, a fear of a military group who will lead us into war. The reason that I know this fear is unwarranted, is because one of my chores was to send young boys out to die, and I do not believe any senior commander who has ever sent young men out to die, wants war.

I don't believe that any professional group hates war as much as the military.

Mr. WEISL. General, since this would be an advisory group, that would be at the beck and call of the Secretary so that when the Secretary has to decide a military matter or a procurement matter, relating to military, he would have the best professional advice. Why would the public consider this power in the hands of a military group?

General DOOLITTLE. I believe this is an evolutionary program that will take a little doing.

Mr. WEISL. Don't we sometimes underestimate the intelligence and the perception of the public?

General DOOLITTLE. Yes. I have great confidence in the concept that a properly advised public will react soundly, and that is something that this group is doing in a very valuable way.

Mr. WEISL. General, have you any other suggestions that you can give to this committee concerning this problem—this general problem that we are investigating?

General DOOLITTLE. Only one last thought, Mr. Weisl. I am convinced that an America alerted to the urgency of our present situation,

can best Russia philosophically, technologically, industrially, and militarily.

I am equally convinced that it will require harder work on our part, and some sacrifice.

It is considered that the Soviet shortage of consumer goods may be a long-term weakness and that the Soviet people may become dissatisfied. I do not think that we can depend on this. It would be fallacious thinking, wishful thinking for us to depend on it.

However, I am quite sure that the long-term conflict between the Soviets and ourselves will be determined by their willingness to get along with less, as they are doing now, as opposed to our willingness to make more sacrifices than we are making at the present time.

Mr. WEISL. General, you have very eloquently pointed out that this committee can serve a great benefit by advising and alerting the people of the United States to the danger that they face, but in the course of my investigation I find that all of us, including the committee, need more information from the military and the civilians and from the committees that are engaged in this war effort.

And you would agree, would you not, that this is the time for every man with information and knowledge to lay the facts on the table clearly and succinctly without holding anything back so that this committee can be properly informed and take proper action?

General DOOLITTLE. That is correct.

Mr. WEISL. I have no further questions, Mr. Chairman.

MISSILE PROGRAM NEEDS MORE FUNDS, RESEARCH, AND COORDINATION

Senator JOHNSON. Thank you, Mr. Counsel.

General Doolittle, by way of a brief summary, if you were given the full responsibility and the complete and absolute authority over our missile program, what would you do to insure carrying out the recommendations that you have made to this committee?

General DOOLITTLE. Mr. Chairman, I believe that the Air Force missile program under the present Western Development Division, or the recent Western Development Division, has gone ahead very well indeed.

Possibly some additional funds would permit some increase in the rate of readiness and the rate of production of the IRBM, the intermediate range missile.

Senator JOHNSON. Would you consider that highly desirable?

General DOOLITTLE. I consider that highly desirable.

As far as the ICBM is concerned, I believe the program is excellent, that it is adequately financed but we must be very alert should they come in to new problems and new difficulties that we make whatever is necessary available to them in order that that program can go forward with all possible expedition.

Senator JOHNSON. Well, now, if you were given full authority and full responsibility over our missile program in order to carry out the recommendations you make, is the only thing you would suggest more funds?

General DOOLITTLE. Certainly, there is some coordination of the overall long-range missile program required.

As I said, the Air Force program did not get into full gear until that coordination took place within the Air Force on their own program.

Certainly, a national coordinating agency would avoid unnecessary wasteful duplication. And I feel that at the present time we must watch out for two things: One is the fastest possible progress, and two, is the lowest possible cost.

Senator JOHNSON. General, to what extent, in your opinion, has our missile program suffered because of deficiencies in our research and development program?

General DOOLITTLE. It is very difficult to give a quantitative answer, Mr. Chairman, but certainly the rate at which we can progress is a function of our accumulated information, and that information sometimes takes a long time to acquire.

I would like to answer that question by saying that we must do more basic research, and that changes in our overall military program, restrictions in budget should not interfere with our accumulation of basic knowledge.

Rather, I should say, if there is a budget reduction we should do more basic research in order to be able to move more rapidly when the obstruction is removed.

Senator JOHNSON. General Doolittle, do you believe that a project like the Manhattan project would be desirable in connection with the missile program?

General DOOLITTLE. I would rather say, Mr. Chairman, that I believe more coordination of the effort is required.

Senator JOHNSON. General, what, in your judgment, should we do to strengthen America's military research and development program?

General DOOLITTLE. Short term, putting more money into our research and development effort would give the effort an immediate stimulus. But long term, we have to consider the educational program, and we have to consider the prestige of the scientists and the science student.

Senator JOHNSON. So, summarizing, General, you would accelerate the program by providing more funds, and you would attempt to effectuate a better coordination?

General DOOLITTLE. That is correct.

Senator JOHNSON. General, I received in the mail this morning a note from a very distinguished scientist, in which he sent me a little verse that he said he had not composed himself, but which he wanted brought to the attention of the committee. In the light of your testimony of the necessity for more funds I am sure you don't share this fellow's view but I would like to have your opinion of it if you will indulge me a moment. [Reading:]

I'd rather be bombed than be bankrupt,
I'd rather be dead than be broke.
'Tis better by far to remain as we are,
And I'm a solvent if moribund bloke.

General DOOLITTLE. I am afraid I cannot endorse that, sir.

Senator JOHNSON. Thank you, General.

General DOOLITTLE. Thank you very much.

Senator JOHNSON. Senator Bridges?

FOREIGN INTELLIGENCE: COLLECTION, INTERPRETATION, AND USE

Senator BRIDGES. General, I have listened with interest to your testimony and I want to ask you a few questions.

Do you believe that Central Intelligence and various intelligence services have consistently, over a period of years, underestimated the Russian strength?

General DOOLITTLE. No, sir. I believe that frequently those who have interpreted that intelligence have underestimated the Russian strength. The acquisition of intelligence is one thing; the interpretation of intelligence is another, and the use of that intelligence is a third.

Senator BRIDGES. You spoke of the period between 1946 and 1953 during which there was virtually no work done in the general missile program.

During that period, were our intelligence services feeding the proper intelligence information into our Government?

General DOOLITTLE. Mr. Bridges, we have never gotten as many hard facts as we would like to have, out of Russia.

During the period shortly after the war, our intelligence system was poor. Since that time it has consistently improved. Now it is much better.

Senator BRIDGES. Well, you are not in a position then to testify whether or not we got the information between 1946 and 1953 and did not act, or whether we got it and ignored it?

General DOOLITTLE. I would like to point out, Mr. Bridges, that I was on the President's Committee which made a study of the covert side of our Central Intelligence Agency.

I am now on the President's Committee on Foreign Intelligence. I would much prefer, if we are going to deal with intelligence matters, to deal with them in closed session.

Senator BRIDGES. I agree, if you have to go into details.

I was just talking about the general philosophy.

General DOOLITTLE. My embarrassment is that I know some things I cannot say and if I did not know them I could say them.

[Laughter.]

Senator BRIDGES. I understand.

COMPARISON OF UNITED STATES AND RUSSIAN EDUCATIONAL SYSTEMS

I will go back a moment to your statement in which you discussed the Russian educational system and indicated what improvements we need. You stated that we need more and better teachers, greater pay, and more classrooms.

Now that is quite a large order. But haven't you omitted one thing in there, which is in giving the young men and women, the boys and girls of today, too much freedom in the selection of courses which they are taught?

Now, this I believe very firmly and I would like to have an authority like yourself comment on it. I don't think the answer is wholly in more teachers and greater pay and more classrooms. I think the students in the secondary school and in college too, are allowed too much freedom of elective subjects and it is only human nature to pick out the easiest ones.

Now, I have three boys, who went through school and college, and were in the military service, and I found out that their tendency was to elect the easiest subjects. I think you must have a stiffening of the curriculum of schools so that some of the harder subjects that will

be more useful to the students and the country will be required. I think that is one of the great weaknesses in the American system and I wonder if you would comment on that.

General DOOLITTLE. Yes, sir. You may remember that I said we had to work harder and that hard work had to start in school. That was part of my thesis.

At the risk of boring you with some statistics, I would like to say that we take 12 years to go through high school here, 8 years in grammar school, 4 years in high school. In Russia they take 10 years. Here we work 5 days a week. In Russia they work 6 days a week in school. Here we work roughly 5 hours a day partly due to the shortage of classrooms. There, including their homework, they work 12 hours a day. At the end of the college term here 14 percent of our students will have had algebra, geometry, and trigonometry. At the end of their high-school course, 100 percent of their students will have had algebra, geometry, and trigonometry plus the calculus which we don't get until we go to college.

In connection with the sciences, 25 percent of our high-school graduates have 1 year of physics; 100 percent of their high-school graduates have 5 years of physics; 33½ percent of our high-school graduates have 1 year of chemistry; 100 percent of their graduates have 4 years of chemistry.

We are making our high-school course too easy. We are making it so easy that even the stupid boys can get through. That is seriously penalizing the bright boys and seriously penalizing us in the acquisition of the type of people that we need.

In Russia, if a chap is not apt at science, and mathematics, he is sent to a vocational school where he can learn a vocation.

I certainly feel that the first thing we have to do is work harder in our schools. But before we can work harder, we have to have more room in which to work, and better people to direct the work.

Senator BRIDGES. I agree with that. In substance you have confirmed my statement here that there is too much freedom in the election of courses in both secondary schools and in colleges and certainly human nature, being what it is, you must direct young minds——

General DOOLITTLE. That is right.

Senator BRIDGES (continuing). In certain directions where you have given them the opportunities to do their own work.

General DOOLITTLE. Certainly we should not give youngsters an opportunity to be lazy.

INTERSERVICE COMPETITION: ADVISORY STAFF TO SECRETARY OF DEFENSE

Senator BRIDGES. General, one more question here.

You spoke about the fact that there should be competition but not too much competition, that there should be differences of opinion but not too many differences of opinion, and so on, and then you said that you were approaching the subject of one uniform; however, you were not ready to give us a thought on that yet.

Don't you believe that as of today a certain amount of competition between the three services is a very healthy thing, up to a certain point?

General DOOLITTLE. I believe that competition is a very healthful thing. I believe that competition on a football field is a very health-

ful thing. But the competition should be directed toward the opposing team. I believe that when people on the football team compete each one ought do the best job he can do, that is healthy competition. When each chap competes in order to show up the other one, that is destructive competition.

Senator BRIDGES. And there should be at the head a coordinator, a czar, or director, whatever you may call him, who will be the final authority to determine where that competition ends and to direct the competition or funnel it into one objective.

General DOOLITTLE. The point I make, sir, is that weapons have become so devastating that we do not have time to dillydally over decisions. They must be made promptly and they must be made correctly.

Senator BRIDGES. Well, now, in that connection, you have advocated a type of military policy committee to associate with the Secretary of Defense.

I went through the hearings of the Joint Chiefs of Staff and I thought that one of the duties of the Joint Chiefs of Staff was to have the top technical people militarily make the decisions and certainly to advise the Secretary of Defense.

Wouldn't you, in your suggestion, be setting up just one more group that would be a complication rather than an asset?

General DOOLITTLE. I believe the Joint Chiefs of Staff are doing an excellent job. I believe also that there are areas in which the Joint Chiefs of Staff have not come to an agreement. Those disagreements should be resolved. I have offered one suggestion as a means of resolving them. I am not sure it is the best suggestion. I started by saying, I did not have much competence in this particular area, and it is an extremely complicated one, and will require a very comprehensive study.

Senator BRIDGES. But would you not include it, then, as an advisory group, within the Department of Defense. Would not the Secretary of Defense be faced with the same problem that he faces now with the Joint Chiefs?

Is it any more likely that the advisory group would make the decision than the Joint Chiefs would?

General DOOLITTLE. I believe they would, because every serviceman has some loyalty to his service. The Joint Chiefs, each one, as the head of his service, has a much greater responsibility, and all of the people under him feel that he has let them down if he goes against their desires.

Senator BRIDGES. Certainly there is one thing——

General DOOLITTLE. The loyalty goes two ways.

Senator BRIDGES. If it held true, and if the Council ever developed, then those generals or admirals once having served on the Council could never go back into their respective services again. They would have to be retired, because if they went back into their services and they had taken positions against their respective services, while serving on the Council their careers would be ended. That is rather bluntly stated, but human nature would enter into the fact there; would it not?

General DOOLITTLE. I would not go that strongly, sir, but I would say that it would not help them any. [Laughter.]

Senator BRIDGES. That is all.

Senator JOHNSON. Thank you, Senator Bridges.

We are delighted to have the senior member of the Armed Services Committee present with us this morning—a man whose name is known in every American household. He is not a member of the subcommittee, but he is the ranking member of the full committee. Senator Byrd, would you like to ask some questions?

Senator BYRD. Mr. Chairman, most of the questions I have had in mind have already been asked, and I am here to get information. I am not a member of the subcommittee, but I am deeply interested, and I want to thank General Doolittle for a very excellent presentation he has made.

General DOOLITTLE. Thank you, sir.

Senator JOHNSON. Thank you, Senator Byrd. We are delighted to have you with us, and hope you will stay as long as you can.

DEFINITION AND STATUS OF MILITARY PREPAREDNESS

Senator Saltonstall?

Senator SALTONSTALL. Mr. Chairman, thank you.

General Doolittle, may I ask you to elaborate a little on two general terms that you used, about which I am not quite clear. You state that the present weapons system was not adequate. There could be some improvement without legislation and some with legislation. When you use the words "weapons system" just what do you mean?

General DOOLITTLE. I did not mean to use "weapons system" in that relationship. I meant to say that the Military Establishment—in the Military Establishment there could be some changes, and that would effect a more effective utilization of the various weapons systems.

Senator SALTONSTALL. In other words, it is the Military Establishment that are using the present weapons and improving their present weapons, that you spoke about?

General DOOLITTLE. I misspoke myself if I used the term in that way.

Senator SALTONSTALL. Mr. Weisl asked the question whether we were behind Russia in military preparedness, and you answered that question, if I remember correctly, "Yes." Now, there again, "military preparedness" is a very broad term. Would you be willing to define that a little more clearly?

General DOOLITTLE. Speaking of specific weapons, it is my belief that we are ahead of Russia in the capability of our Strategic Air Force. However, you will remember that, shortly after the war, we had an offensive capability; Russia had none, and she devoted her efforts to building up her air defenses; so, she has been building up her air defenses longer than we have. I believe that she has a stronger air defense than we have.

Senator SALTONSTALL. So, when you use the words "military preparedness," you use them more in terms of our defensive posture rather than in our aggressive posture?

General DOOLITTLE. I did, but shouldn't have. I will have to qualify that by saying that at the present time I believe that we are stronger, militarily, than Russia.

Senator SALTONSTALL. Good.

General DOOLITTLE. At the present time, Russia's rate of progress is more rapid than ours, and, unless we continue to forge ahead at full speed, she will soon overtake us.

NACA—MISSION AND REQUIREMENTS

Senator SALTONSTALL. You stated in your opening answer, in your first answer to questions, that you were the Chairman of the National Advisory Committee on Aeronautics.

General DOOLITTLE. NACA, the National Advisory Committee for Aeronautics.

Senator SALTONSTALL. I, personally, have always felt that Congress did not give that Committee adequate support, financially. Could you define a little bit what that Committee does, its work, because always it seemed to me very important and we did not give it due consideration.

General DOOLITTLE. The National Advisory Committee for Aeronautics was established by the Congress in 1915 to develop American aviation and to keep us abreast of, and preferably ahead of, the rest of the world in aeronautics.

It now has three major laboratories, one, the Langley Laboratory, Hampton, Va.; one, the Lewis Laboratory at Cleveland; and one, the Ames Laboratory at Moffett Field, Calif. It has two subsidiary laboratories, one at Edwards Air Force Base; and a missile-testing laboratory at Wallops Island.

The total manpower is in the order of 8,000; the total budget for new equipment and for operation is in the order of \$100 million a year.

Senator SALTONSTALL. Do you believe that we in Congress are supporting that Committee adequately?

General DOOLITTLE. I have had to appear before the Bureau of the Budget, and then before the Congress, and I would be very grateful if both agencies would be more generous in the future.

Senator SALTONSTALL. The work of that Committee is very important.

General DOOLITTLE. I believe it is imperative that this Committee be properly supported if we are to do the research necessary to improve our position. For a long while we wanted to hold our position. Now we must improve our position.

Senator SALTONSTALL. And there is no duplication, from the Government point of view, in the work that this Committee does?

General DOOLITTLE. No, sir. The Government does what work they can in their own laboratories, and the NACA takes care of the overflow from the Government laboratories. They work very closely together.

On the NACA there are 2 senior members from the Air Force, 2 senior members from the Navy, and, I hope there will soon be 2 senior members from the Army. We are presently soliciting that legislation.

Senator SALTONSTALL. And you believe in the work of the National Science Foundation?

General DOOLITTLE. Yes, sir; work very closely with them.

Senator SALTONSTALL. And you follow that work, too, fairly closely?

General DOOLITTLE. The Director—I am the Chairman, sort of Chairman, of the Board of Directors. The actual Director, Hugh

Dryden, who corresponds to the president of a corporation, works very closely with the Science Foundation. As a matter of fact, they are next door; the offices are next door.

RELATIVE POSITION OF ADVISORY STAFF AND JCS

Senator SALTONSTALL. One other question that I am still not clear on is—and this is a touchy question, judging from the way you answered Senator Bridges, and also counsel—is your idea of the position of the Joint Chiefs of Staff. Now, we listened to Dr. Bush yesterday quite at length. Of course, he has some very strong ideas on that subject.

Do I get from you the feeling that the Joint Chiefs of Staff should still be a planning organization, from the point of view of military operation, and that the Secretary of Defense should have also an advisory group to advise him? Or do the Joint Chiefs of Staff, under your conception, become more of an operating, a joint task force agency?

General DOOLITTLE. I would like to see the time come when there was an operating staff.

Senator SALTONSTALL. A joint task force?

General DOOLITTLE. As well as an advisory staff. I think the first step is an advisory staff, which would later become an operating staff.

Senator SALTONSTALL. I'm still not clear on this point.

General DOOLITTLE. I say the first step in giving the Secretary of Defense a military staff would be an advisory staff to advise him on military matters, so he could resolve the differences of opinion that exist at the Joint Chiefs of Staff level. Someday, I would hope to see a general operating staff, with one man able to make the military decision.

Senator SALTONSTALL. Which would be similar to, we will say, General Eisenhower's position in Europe or General MacArthur's position in the Far East?

General DOOLITTLE. That is correct.

Senator SALTONSTALL. My time is up, General, and I would like to just ask you this question: I like the sixth point that you mentioned, about a high degree of morality, when you said our case was not hopeless and that we were moving ahead, and we would be ahead of Russia, industrially, economically, and 3 or 4 other terms, you forgot morality.

Now, you certainly——

General DOOLITTLE. I said philosophically, and considered morality in that.

Senator SALTONSTALL. I would like to have you come right out and say it.

General DOOLITTLE. All right, sir.

Senator SALTONSTALL. Thank you very much.

Senator JOHNSON. Senator Kefauver?

INADEQUATE COORDINATION OF MISSILE PROGRAMS

Senator KEFAUVER. Thank you, Mr. Chairman.

General Doolittle, you said in a general way that what we needed to get on with our rocket and missile and general defense program was more coordination.

Will you give us examples of where the lack of coordination has deterred our efforts, in the missile program, for instance?

General DOOLITTLE. I believe the quicker a decision is made on the Thor-Jupiter controversy, the quicker we will make progress, and the more money we will save.

Senator KEFAUVER. Were you a member of the committee which decided which service was to go ahead with our satellite or inter-continental missile program?

General DOOLITTLE. No, I was not in on that, sir.

Senator KEFAUVER. Do you feel that lack of coordination has substantially held back our missile and satellite and general weapons program?

General DOOLITTLE. I did not sit in on that committee, Mr. Kefauver, and I am not sure of my facts.

Senator KEFAUVER. Well, then, sir, advocating greater cooperation, what specific steps and measures would you take to bring it about?

General DOOLITTLE. I believe you were out when I——

Senator KEFAUVER. No, sir. I have been here all the time. I heard about the advisory board to the Secretary of Defense.

But right now, what specific measures would you take to insure greater coordination?

General DOOLITTLE. I would answer that question by saying that the Air Force missile program is coordinated within the Air Force, and is going ahead very well indeed. I believe that the overall missile program should be coordinated within the Defense Department.

Senator KEFAUVER. Well, how would you do that?

General DOOLITTLE. You are asking me questions that I have not considered. I did not consider that was my job, so I did not give much thought to it, sir.

Senator KEFAUVER. But considering that we hope missiles and satellites may have some civilian use and application in the years to come, do you think that the missile program should be exclusively coordinated in the Defense Department under the Secretary of Defense?

General DOOLITTLE. I believe that the differences of opinion that exist between the services should be resolved in the Office of the Secretary of Defense.

Senator KEFAUVER. Do you feel they have not been?

General DOOLITTLE. Not all of them; no, sir.

Senator KEFAUVER. Which ones have not been?

General DOOLITTLE. I mentioned one, the Jupiter-Thor program.

Senator KEFAUVER. In saying that you feel the Air Force is in a position to go ahead with the satellite or the ICBM and the intermediate missile, and that they should have more money and backing to do that, have you considered the potentialities of the Army program, the Redstone Arsenal?

General DOOLITTLE. I am not acquainted with the Army program, sir.

Senator KEFAUVER. How can you say the Air Force program is better than the others?

General DOOLITTLE. I didn't. I said the Air Force program got better when they coordinated it within the Air Force.

Senator KEFAUVER. Well, do you know, then, which program is better to push at the present time?

General DOOLITTLE. I am a little deaf, sir.

Senator KEFAUVER. I say, do you know, then, which program is better to get behind at the present time, the Air Force program, the Army program, or which program?

General DOOLITTLE. No, sir, I have no recommendations on that.

Senator KEFAUVER. I thought, sir, you advocated the first thing to be done is to get stronger behind the Air Force program.

General DOOLITTLE. No, sir. I strongly recommended that we get behind the best program, and am not in position to say which one that is.

Senator KEFAUVER. Well, how do you think that that should be determined? Who is in the best position to determine that?

General DOOLITTLE. Certainly it should be determined in the Office of the Secretary of Defense.

Senator KEFAUVER. Do you think it has been determined at the present time?

General DOOLITTLE. My understanding is that a decision will be made around the 1st of January. This is purely hearsay. I have not been told this officially.

Senator KEFAUVER. Well, do you not think a decision should have been made a long time ago?

General DOOLITTLE. Yes, sir.

Senator KEFAUVER. How long ago?

General DOOLITTLE. As soon as it was possible to evaluate the two systems.

Senator KEFAUVER. Well, they had a committee operating a year ago to determine that, did they not, headed up by Mr. Quarles? Did they not have a committee to evaluate the various programs and make the decision?

General DOOLITTLE. There has been considerable study of it, but I do not believe that a decision has ever been reached at high level as to which is best, which is the better of the two, and which should be specialized on.

Senator KEFAUVER. You think that is one of our grave shortcomings, the fact that no decision has been made and it has been delayed?

General DOOLITTLE. I think one of our shortcomings, Mr. Kefauver, is a lack of prompt decisions on important things—

Senator KEFAUVER. Thank you, General.

General DOOLITTLE (continuing). Because of honest differences of opinion on the part of military people.

Senator KEFAUVER. Thank you, Mr. Chairman.

Senator JOHNSON. Senator Flanders?

General DOOLITTLE. I am sorry, Mr. Kefauver, I do not hear very well, and I apparently misunderstood something that was said, and I apparently said something that I did not mean to say.

Senator KEFAUVER. Well, I am sorry I did not speak louder. I do not know what it was that you referred to. [Laughter.]

General DOOLITTLE. Well, I did not mean to say that a decision should be made in favor of the Air Force, and if I said that, I misspoke myself. I think a decision should be made in favor of the best weapon.

Senator KEFAUVER. General, as I got the burden of your testimony, in response to questions by Senator Johnson, he asked you what should be done now, and I understood you to say that we should get

behind the Air Force program with money and backing and go ahead with it. So I interpreted that as meaning that you had information as to the superiority of the Air Force program, and you were advocating that over the Army program.

But I find now that that was not the case; is that correct?

General DOOLITTLE. If I created that impression, I spoke poorly.

Mr. WEISL. You did not create that impression as far as counsel was concerned, General Doolittle.

General DOOLITTLE. Thank you, sir.

Senator JOHNSON. Thank you, Senator Kefauver.

INTERSERVICE TRAINING IN SERVICE ACADEMIES

Senator Flanders?

Senator FLANDERS. General, I have been very much interested in and concerned with the question of cooperation between services, every member of which has been trained in 1 service only, and every member of which has served in 1 service only, and expecting objective cooperation.

I would like to inquire of you whether you think there would be any usefulness in cross-fertilization at the stage of training in the three Academies; would there be any usefulness in having a course in which the Army gave the Navy and the Air Force its concept of its sphere of action, and in which, in turn, the Navy presented its point of view before the Army and the Air Force, and the Air Force before the Army and the Navy, in the process of educating the young officers?

General DOOLITTLE. I believe that would be a valuable thing.

Senator FLANDERS I would like——

General DOOLITTLE. And after that, I think interchange in the services would be a valuable thing.

Senator FLANDERS. Yes. But I would like, Mr. Chairman, to nail that suggestion down as one of the things we might well consider.

COMPOSITION OF ADVISORY GROUP

Now, the next thing is like unto that. If I understood our friend, Van Bush, yesterday, his suggestion was that the advisory group might well be made up of elder statesmen of the services who had years of experience and nothing to lose.

What do you think of that proposal?

General DOOLITTLE. The danger in that proposal is that after people leave the service and become separated from it, they soon lose touch with new developments, and that advisory group must be a group of people who are in touch with new developments and who are still young enough to accept and adapt new concepts.

Senator FLANDERS. You would not want to tag them just before they passed out, while they were still in touch?

General DOOLITTLE. I would like to point up, Mr. Flanders, that tradition is a very valuable thing until it begins to interfere with progress, and we have to be very careful in a committee of that kind not to get traditionists on it. For instance, I remember not so long ago when the cavalry had to give up their horse and saber, and become mechanized. They did it very grudgingly. I remember my own group of aviators when we had to give up our helmet and goggles,

the insignia of our profession, and go from open planes into closed planes, we resented it very much, indeed.

So we have to be sure that this group of elder statesmen are (a) read into everything that is going on, and (b) are still a group of aggressive, progressive people who can accept and utilize new concepts.

Senator FLANDERS. I must say, General, that you are making the task of selecting this advisory group rather difficult.

General DOOLITTLE. I think it should be very carefully selected, sir.

AIRCRAFT VERSUS MISSILES: MISSION AND CAPABILITY OF STRATEGIC AIR COMMAND

Senator FLANDERS. Thank you. Now, I have one other question that I wish to ask you, perhaps not in a single question but briefly. There has been some talk here and there about the future of the Air Force being dubious in view of the potentialities of missiles of all sorts and varieties. I showed a picture of 39 of them yesterday which I thought was too much. But in view of all these available potential and hoped for missiles, the field of the Air Force seems to be, in view of some critics, seems to be shrinking. But I think we have agreed so far, as I have listened to the questioning of this committee, that there is at least an intense, invaluable and irreplaceable interim field for the Air Force, whether it is going to pass out eventually or not.

Now, you realize that when I say "pass out," I am not convinced that it is going to, but I am just talking from that standpoint for the moment. In view of the concentration of the Russians initially on defensive measures, have you any confidence in the Air Force as presently constituted being able to reach a good percentage of targets in Russia?

General DOOLITTLE. Yes, sir. I am convinced that the Air Force as presently constituted will be our basic weapon for the immediate future. I see the missile first supplementing and gradually replacing some of the Air Force missions in both offense and defense. I do not expect to see the airplane out of the air in my lifetime.

Senator FLANDERS. You mean militarily out of the air?

General DOOLITTLE. I mean militarily.

Senator FLANDERS. Yes. Strategically, you don't expect to see it strategically out of the air?

General DOOLITTLE. This is a question that cannot be answered until an IRBM and an ICBM have been proven and then put into production, and we are sure that they will do all of the jobs that the present Air Force SAC airplanes will do. By the same token, I do not believe that missiles will completely replace the fighter plane until we have something in a missile that will accomplish the present difficult problem of identification, which only a man can do so far.

Senator FLANDERS. Yes; there is no IBM machine yet can do that.

General DOOLITTLE. No, sir.

Senator FLANDERS. Now then, I just want to express again my understanding that you feel that in spite of the concentration of the Russians on air defense, that the existing and developing Air Force of this country can reach a good percentage of the targets, in case of necessity, in Russia?

General DOOLITTLE. Yes.

Senator FLANDERS. Thank you. That is all, Mr. Chairman.

General DOOLITTLE. May I qualify that by saying that a very few airplanes could not. We have to be able to attack in strength to get enough through to do the job. There is a fallacious theory that if there are 10 targets that we would like to take out and each target can be taken out with 1 bomb that we need only 10 bombs and 10 airplanes. This is wholly fallacious, because we must overwhelm their defenses in order to get through. We must saturate their defenses.

Senator FLANDERS. That leads, Mr. Chairman, if I may have one more question—I think I am within my time—to looking at the same problem in the reverse. You would expect that if the Russians are sensible, and sometimes we think they are and sometimes we think they are not, if they were to attack, the first thing probably that they would attack would be our bomber bases. Is that not a reasonable—

General DOOLITTLE. That is a reasonable assumption.

Senator FLANDERS. Yes. Do you then feel that further dispersal of our bomber bases is a No. 1 requirement in our airplane program?

General DOOLITTLE. Yes, sir. The Air Force presently has a dispersal program. I believe that dispersal program should be hurried so that we have not more than one squadron of heavy bombers on each base.

Senator FLANDERS. Thank you. That is all, Mr. Chairman.

MISSILE PROGRAM DIRECTOR WITH POWERS OF THE PRESIDENT

Senator JOHNSON. Senator Stennis.

Senator STENNIS. General Doolittle, I think your testimony here has certainly been very valuable for the committee; most of the questions I would have asked you have already been asked and have already been answered.

There is one thing, though, that I want to emphasize. As I understand, you say that we are lagging behind Russia now in the rate of progress?

General DOOLITTLE. Yes, sir.

Senator STENNIS. Of our military program, including the missile program. And that this lag is due more to a lack of emphasis than to lack of capacity or ability. Now, you and the other witnesses have convinced me that to really make this program move as it should, there must be some single responsible official armed with the powers of the President to coordinate, as you say, and keep moving this entire missile program at full speed.

Do you agree to that, that there must be someone armed with the powers of the President?

General DOOLITTLE. Yes, sir.

Senator STENNIS. To supervise and push to the utmost the missile program?

General DOOLITTLE. That is right.

Senator STENNIS. Is that correct?

General DOOLITTLE. That is right.

Senator STENNIS. And, if necessary, that official would have to exercise the powers of the President even beyond the Budget Bureau or even the Department of Defense?

General DOOLITTLE. That is right.

Senator STENNIS. I thank you very much, General Doolittle.

That is all, Mr. Chairman.

Senator JOHNSON. Thank you, Senator Stennis.

PRESIDENTIAL ADVISORY COMMISSION COMPOSED OF SENIOR OFFICERS

Senator CASE?

Senator CASE. Thank you, Mr. Chairman.

General Doolittle, your appearances before congressional committees are certainly stimulating in every instance and this morning has been no exception to that proposition. The discussion that you have given us relative to the problems within the Defense Department, the organizational structure of the Defense Department, the definition of roles and missions, is one that has intrigued me in the past a great deal.

Last August when the Military Construction Subcommittee presented its bill to the Congress, I proposed at that time the creation of a Presidential commission to take the first step. It seems to me as I have listened to you this morning, you have defined 2 steps, 2 problems. One is the study of the structure of the Defense Department, and the second is the possible creation of an overall operating staff.

Now, I was very much interested in Senator Flanders' suggestion or the question he put to you about the utilization of some senior officers. Last August when I said I thought the time would come for the President to appoint a commission to examine the structure of the Defense Department and consider the possible simplification of our present triplication of armed services, I suggested that the early retirement of senior officers in recent years affords an ample reserve of qualified men who could serve on such a Presidential commission.

Now, I call your attention to the fact that what I was suggesting there was a Presidential commission to inquire into the structure of the Defense Department. It was not the overall operating staff. So I want to, with that in mind and with your own statement in mind that any reorganization within the Defense Department should be evolutionary so as not to upset it—I wonder if you would not agree that the senior officers who have been early retired and who are still mentally alert and acquainted with the Defense Department, the Defense Establishment, would not afford a pool from which the President might draw material for a commission to study the structure of the Defense Department?

General DOOLITTLE. I believe that such people should serve on a committee of that type. There must be on that committee some knowledge of the military, and it can only be gotten from military people, ex-military people in this case.

Senator CASE. Members of our subcommittee on military construction last summer, as Senator Stennis will recall—Senator Stennis, Senator Jackson, and myself—had several conferences with representatives of the different services when we were making decisions relative to construction of stations for Nike and Talos and Bomarc and all things related to the point defense system or even the small area defense system; and we were impressed, I am sure, with the fact that we have men of great outstanding ability in the Army and in the Air Force, but there seemed to be a limitation on interservice use of their ability.

I am trying to find some way in which we could make available to the total defense problem the abilities of these men. It seemed to

me that a study by a qualified commission was necessary. I am going to, if I may, send you some of my observations on that at the time, but I think nothing more important could be done by this committee than to make some recommendation with regard to the possible simplification of our triplification, which I think we now have, and the determination of roles. We have seen each service interpret its roles, and as a result, we do have a good deal of rivalry and I think some wasteful competition in talent and in material and in funds.

General DOOLITTLE. Yes, sir.

Senator CASE. I think your testimony on that point has been very helpful this morning.

That is all, Mr. Chairman.

Senator JOHNSON. Thank you, Senator Case.

OVERTIME CEILING IS A FISCAL LIMITATION

Senator Symington?

Senator SYMINGTON. General Doolittle, it is a pleasure to see you here this morning, sir. In my opinion, you and General Spaatz are more responsible for furthering the airpower of this country than any other living men. It is an honor to have you before the committee. Can you hear me?

General DOOLITTLE. Just barely, sir.

Senator SYMINGTON. I will try to get a little closer.

One thing that surprised me a bit. You said that the intercontinental ballistic missile was adequately financed. The question of overtime involves the question of financing, and inasmuch as at least until very recently there have been limitations on overtime on the Air Force ballistic missile program, would you not call a limitation on overtime a lack of adequate financing?

General DOOLITTLE. I am repeating, Mr. Symington, what General Schriever told me last week. I asked him if additional money would expedite his program. He said at the present time no. However, there would be points where he would come up against handicaps and then would need extra money to get along.

Senator SYMINGTON. A limitation of overtime would be a fiscal limitation, would it not?

General DOOLITTLE. Yes.

ADDITIONAL FUNDS NEEDED TO RETAIN MECHANICS AND OPERATE PLANES

Senator SYMINGTON. I have a story here by a responsible reporter, Tom Lambert, in the New York Herald Tribune on November 13:

The Defense Department has lifted restrictions on overtime pay for workers developing the Army's intermediate range ballistic missile, but is keeping a ceiling on overtime for most workers on the Air Force's intermediate range and intercontinental ballistic weapons.

Then the article proceeds to develop that in more detail. Do you know if there has been a change in this program since the 13th of November?

General DOOLITTLE. I do not.

Senator SYMINGTON. I also have some more information on that, and I am glad that you do feel that a limitation on overtime is a fiscal limitation.

Now, you mentioned that you thought that, net, we were ahead of Russia primarily because of the Strategic Air Force; is that correct?

General DOOLITTLE. I believe that our Strategic Air Force is ahead of Russia's strategic air force, and that is primarily because of the excellence of the equipment and the superb training of the pilots and crews. It can be made still better if we get a little more money for it.

Senator SYMINGTON. If the Strategic Air Force or much of it over a period of weeks had been grounded because it did not have enough money for fuel, that would affect your opinion in that regard, would it not?

General DOOLITTLE. This to me would be a critical shortage, one not to be tolerated.

Senator SYMINGTON. Now, about the training of the crews, I am glad you brought that up. In the airpower hearings last year, it was pointed out by General LeMay and General Wade how SAC crews suffer because of lack of money, lack of maintenance and operation funds and lack of training funds. One illustration of that was when General Wade said that at the end of the fourth year of his first enlistment the man in SAC is ready for upgrading to the skilled level, to the supervisory technical level. It is at this point that 90 percent of these people leave the service and return home. At this point in his life, the Air Force has invested in him some \$22,500 and has received 1½ years of productive effort.

That is the way they analyze it. In a 4-year man they start getting productive effort back from him in the last 1½ years of his first enlistment. This airman, like so many of our technicians, General Wade continued, has no trouble getting a job that will start him out at a salary paying 2 to 6 times as much as the Air Force can pay him.

What would be your comments on that, General?

General DOOLITTLE. I believe the most serious problem with which the Strategic Air Force is faced today is the acquisition and retention of competent mechanics to maintain the aircraft, the engines, and the electronic equipment, and anything that we can do to retain these people after they have been trained and get them to reenlist is a desirable thing to do.

Senator SYMINGTON. What would you suggest?

General DOOLITTLE. Certainly one thing is money. The Air Force is doing everything they can within their own organization. An increase in pay would be desirable.

Senator SYMINGTON. General Wade's testimony continued:

The 1951 force was, in our opinion, the strongest and most competent force personnelwise that we have ever had in the Strategic Air Command. Please note how this force of 113,000 is depleting itself, and we will expect to retain by December 31 of this year—

that is December 31 last year—

only some 13,000 out of the 113,000 we had in 1951.

The testimony continues:

Without going into the details, you can see the type of input that we had each year.

Then he said:

In December of this year we will have approximately 170,000 airmen in the commands, of which 77,000, or 45 percent of our strength, will be in their first year in SAC. Another 45,000, or 26 percent, will be in their second year. In

other words, 71 percent of our strength will have less than 2 years in the Strategic Air Command.

General LeMay testified that he discussed the situation with the president of one of the leading airlines. He said:

What would you do in a case like that?

And the president of this airline, specifically, Mr. Patterson of United Air Lines said:

I would never let an airplane leave the ground.

What are your comments about that?

General DOOLITTLE. It is necessary to take certain risks in our Military Establishment that we would not take in a commercial airline. On the other hand, those risks must be minimized or we are remiss in our duty.

Senator SYMINGTON. The more risks you take with an insufficiency of educated mechanics, for example, the greater number of unnecessary accidents you are going to have, isn't that correct?

General DOOLITTLE. That is correct, and you have the loss of life, and not only that, but a loss of equipment which would cost much more than the higher pay for the mechanic.

Senator SYMINGTON. Also, if you have that type and character of abortion in your actual efforts in SAC, then you do not have the defense security that you normally would think that you did have?

General DOOLITTLE. That is correct.

Senator SYMINGTON. Or that the people might think that we have, is that correct?

General DOOLITTLE. That is correct.

Senator SYMINGTON. Are you familiar with the Cordiner report?

General DOOLITTLE. In a general way.

Senator SYMINGTON. What do you think of it?

General DOOLITTLE. I think it will do a great deal to help the services.

Senator SYMINGTON. I have no further questions, Mr. Chairman. Thank you.

GOVERNMENTAL RESPONSIBILITY IN FIELD OF EDUCATION

Senator JOHNSON. Senator Bush?

Senator BUSH. Mr. Chairman, I have been interested in all that the gentleman has had to say this morning, very much so. Most of the questions I had in mind have been already answered.

I would like, however, to ask the general, going back to the question of education—and I think he has put into the record some very valuable information about our education at the high-school level, particularly in the sciences and in mathematics, very useful information. I would like to ask the general what he thinks that the Federal Government should do to correct this situation which he regards as so dangerous? And, of course, what the general said today was said in somewhat different terms yesterday by Dr. Teller and Dr. Bush. Now, has the general any specific recommendations as to what should be done at the Federal Government level by the Congress to help correct that situation in the high schools, in stimulating the retention, the development and retention of better teachers and requiring more and better teaching of mathematics and the sciences and requiring

more people to take these courses so as to give us a field from which we can draw material for our scientific professions? Have you any specific suggestions as to what the Federal Government and the Congress might do in that field?

General DOOLITTLE. Mr. Bush, I have some very definite ideas on what is wrong, but I have not yet thought through the best remedial action to be taken to correct it.

Senator BUSH. The problem is a difficult one for us to deal with because, as the general knows, the business of education at the elementary- and high-school level is largely one where the responsibility lies with the towns and cities and with the States, so that our problem is not a simple one. I think we would welcome any advice that you may later care to give upon reflection as to how far the Federal Government should go in invading that field in order to correct that situation.

It might be worth taking up with your committee because it is such a vitally essential point in connection with the committee's responsibilities.

General DOOLITTLE. I am satisfied that to correct the deficiencies in our educational system will require a great deal of money. Whether that money should come from the municipality, the State, or the Federal Government, I am not prepared to say.

Senator BUSH. I have no other questions, Mr. Examiner.

DISTINCTION BETWEEN DESIRABLE AND WASTEFUL DUPLICATION

Senator JOHNSON. Senator Barrett?

Senator BARRETT. General Doolittle, I would like to ask you to comment on a problem here which bothers me. You stated that the progress in Russia in the missile field is greater than ours and then you mentioned that the coordination, insofar as the IRBM's—the Thor and the Jupiter—are concerned, should be resolved. I have in mind that we do have some duplication of effort in the ICBM—the Atlas and the Titan. I have been wondering whether or not there is duplication in Russia in that field also while it might save some money if that might not be the means of making the progress you desire, by having duplication of effort in the IRBM—the Thor and the Jupiter and the Atlas and the Titan in the ICBM?

It is my thought that that is precisely what we did with the atomic bomb. We had not only duplication but triplication of effort in that field, so I have been given to understand. Maybe that is how we made the progress in that project at that time. Maybe we can make it here in the intercontinental missile, in the intermediate range missile, by duplicating the effort.

I would like to have your comments on that, General Doolittle.

General DOOLITTLE. I would like to point out, Mr. Barrett, that in the bomb there was a great deal of duplication because it wasn't known whether it could be made at all or not, and so the exigency of the situation was such that several different methods of approach were tried, and it happened that all of them proved successful. Some were better than others, and so they were standardized on.

That to me is necessary duplication, not wasteful duplication. In the case of the Atlas and the Titan, an evaluation had to be made as to what would be the cost of going ahead just with the Atlas. Then

an evaluation of what would be the cost of going ahead with both programs. When it gets into the area of production, it will not cost much more to make one type than the others; and, as a matter of fact, it will not cost much more to make two types, if the number to be made is sufficiently great. Your production curve flattens off at the top, someplace there you can make several different types.

Certainly, the developmental cost will be considerably greater, but you are developing two items and you are making sure that out of this will come one that will work entirely satisfactorily; and I do not consider that that duplication in that case is wasteful. It has been very carefully analyzed, and sometimes we have to spend additional money to make sure that a developmental project will be satisfactory.

Senator BARRETT. Do I understand that the duplication in the IRBM is not wasteful, but necessary?

General DOOLITTLE. I believe we could make faster progress and save money if we could put all of the people who have been working on both projects on one and wash out the other one.

Senator BARRETT. So you would leave it up to the Secretary of Defense to select one or the other?

General DOOLITTLE. Yes, sir.

Senator BARRETT. Thank you very much.

Senator JOHNSON. Does that conclude your questioning, Senator Barrett?

Senator BARRETT. It does. Thank you, Mr. Chairman.

Senator JOHNSON. Counsel, do you have any additional questions? Mr. WEISL. I do not.

STRATEGIC AIR COMMAND SHOULD BE MODERNIZED EXPEDITIOUSLY

Senator JOHNSON. Does any Senator have any other question of General Doolittle?

Senator SYMINGTON. Mr. Chairman, I have one further question I would like to ask.

Senator JOHNSON. Senator Symington.

Senator SYMINGTON. General, you have mentioned, as did witnesses yesterday, the importance of SAC. It is true also this missile problem is a very important problem, and there will come a time when we will have more missile strength—the ICBM I think we both know we will not have operational for some years to come. However, we cannot fight with weapons we don't have.

If this country is attacked, it has to defend itself with existing weapons; does it not?

General DOOLITTLE. That is right.

Senator SYMINGTON. Therefore, the more modern that the Strategic Air Force is in its planes, the better for the security of the United States, is that a fair statement?

General DOOLITTLE. That is a fair statement.

Senator SYMINGTON. You and I have been through the question of the B-36 over many years. With all due respects to that airplane and, it is a fine airplane, but it was designed in 1941 after the Nazis overran the lowlands. It has performed its job to the best of its ability. It is now getting somewhat obsolete; is it not?

General DOOLITTLE. I should say it is obsolete.

Senator SYMINGTON. Mr. Chairman, I have not discussed this matter with General Doolittle for many months, but the fact is that we have a number of wings of B-36's still in SAC. It is important to replace those wings with more modern airplanes; is it not?

General DOOLITTLE. That is right.

Senator SYMINGTON. Then what justification do you think there is after sputnik not only in not accelerating the production of B-52's, for example, but also in not restoring the cuts in the production schedules that have been made in the year 1957, this year? Do you not think that ought to be changed?

General DOOLITTLE. I believe we should have 2 programs, Mr. Symington, 1 a program of modernizing SAC with modern known or proved types of airplanes that should go forward with all possible expedition.

Paralleling that should be the program of developing missiles to supplement and later to, in part, replace those weapons.

Senator SYMINGTON. I understand that, and I agree with you. The question that I am asking is, do you not think that the reductions that were made in the production schedules for B-52's in the year 1957, should be restored? That would not even be an acceleration of the program. That would just be replacing the amounts cut out earlier this year.

General DOOLITTLE. I would like to see them restored. However, I was not in the position to have to take everything into consideration that caused that curtailment of budget.

Senator SYMINGTON. If this curtailment is purely a fiscal situation, do you not agree that the situation as it now is, based on your own testimony, is such that we can afford to have a modern SAC, not only in people but also in planes?

General DOOLITTLE. I do agree.

Senator SYMINGTON. Thank you, General.

Senator KEFAUVER. Mr. Chairman, may I ask one question?

Senator JOHNSON. Senator Kefauver.

Senator KEFAUVER. General Doolittle, in your opening statement you said that some of the things that had to be done involved some new legislation or additional legislation, and I did not know if you had specified just what you had in mind.

General DOOLITTLE. No, sir. What I meant to say was that some things, some changes, could be made within the existing structure of the Defense Department. Some changes might require legislation. I did not detail what they were.

Senator KEFAUVER. Are you in a position to give us any more details or generalizations about the legislative changes that you think we should be considering?

General DOOLITTLE. No, sir; I am not prepared on that.

Senator KEFAUVER. Very well. Thank you.

SHORTAGE OF SCIENTISTS AND ENGINEERS

Senator JOHNSON. General Doolittle, in your opinion, is there a present shortage of scientists and engineers for the military programs?

General DOOLITTLE. Certainly; we could go faster if we had more.

Senator JOHNSON. Do you think it might be advisable to work out some arrangement with industry where industry would lend them or give them leave for Government service, if they were needed?

General DOOLITTLE. Industry could make a very substantial contribution.

Senator JOHNSON. And you think that should be done?

General DOOLITTLE. I think the exigency of the situation is such that it should.

Senator JOHNSON. And you think there is no question but what it is needed?

General DOOLITTLE. No question but that it is needed and no question but that we have to make some sacrifices, and that is one of the sacrifices we can make.

SUMMARY

Senator JOHNSON. So, General, summarizing, you would accelerate the missile program by increasing the funds available for it. You would attempt to effectuate better coordination that would give the program more efficiency and more speed through a national coordinating agency. You would attempt to cure the present shortage of scientists and engineers by asking industry to make available some of their people to Government when and as needed.

Is that a fair summary of your statement?

General DOOLITTLE. That is correct. That is a fair summary, yes, sir.

Senator JOHNSON. That is what you think can be done and should be done and must be done now?

General DOOLITTLE. Yes, sir.

Senator JOHNSON. Are there any other questions of General Doolittle by any member of the committee?

General, the committee is very grateful to you for coming here this morning. There are not very many men who are capable of achieving distinguished careers in so many different fields. It is a sign of the strength of our Nation that we have such men as you. In listening to your clear exposition of your views, there is a thought that has run through my mind all morning. We are talking here about short-range objectives and long-range objectives as though they were completely separate.

It seems to me that one of our short-range objectives must be to get busy on the long-range objectives immediately, now.

General DOOLITTLE. That is right.

Senator JOHNSON. We cannot become so engrossed in the purely short-range objectives that we forget about the future or postpone it. Your testimony which has outlined so well the conditions which led to our present situation brings this point home forcefully.

General Doolittle, the Nation has good cause to be grateful to you for your outstanding services which have spanned so many years. Not the least is the contribution that you have made to your country in your testimony to this committee this morning.

General Doolittle, on behalf of the members of the Armed Services Committee and the subcommittee in particular, I want you to know that our gratitude is deep.

General DOOLITTLE. Thank you very much, Mr. Chairman. Thank you very much, gentlemen.

Senator JOHNSON. The committee will take a 5-minute recess.

(Short recess.)

Senator JOHNSON. The committee will come to order.

Our next witness is Dr. John Hagen.

Dr. Hagen, will you please come to the witness chair? Raise your right hand.

Do you solemnly swear that the testimony you shall give shall be the whole truth and nothing but the truth?

Dr. HAGEN. I do.

TESTIMONY OF DR. JOHN HAGEN, DIRECTOR, UNITED STATES NAVY PROJECT VANGUARD; MEMBER, PANEL ON RADIO ASTRONOMY, NATIONAL SCIENCE FOUNDATION, AND FORMER CHAIRMAN, ASSOCIATION OF UNIVERSITIES STEERING COMMITTEES

Senator JOHNSON. Our next witness is Dr. John Hagen, a distinguished astronomer and Director of the Navy's Vanguard project, otherwise known as the earth satellite program.

Dr. Hagen is a native of Canada. He received his bachelor of science degree from Boston University in 1929, and his master of arts degree from Wesleyan University in Middletown, Conn., in 1941.

In 1949, he was awarded a doctor of philosophy degree by Georgetown University.

From 1931 to 1935, Dr. Hagen was a research associate at Wesleyan University. At the Naval Research Laboratory he was Superintendent of the Atmosphere and Astrophysics Division, and worked with the development of microwave radar and radio astronomy.

Dr. Hagen has been associated with the Naval Research Laboratory in Washington since 1935.

Dr. Hagen, it is a pleasure to have you before this committee, and we look forward with eager anticipation to your testimony.

I should say for the benefit of the members of the committee that Dr. Hagen will be examined by our associate counsel, Mr. Cyrus Vance, distinguished partner in the firm of Simpson, Thacher & Bartlett.

EXPLANATION OF VANGUARD PROJECT

Mr. Vance?

Mr. VANCE. Dr. Hagen, as Director of the Vanguard program, will you explain what is the Vanguard project and how it fits into the International Geophysical Year?

In this connection, I think it would be helpful if you would first explain what is the International Geophysical Year.

Dr. HAGEN. The International Geophysical Year is a large scientific program designed to do work in geophysics in most of the countries on the face of the earth. I think the number of adhering countries is just over 60.

This kind of endeavor started in the 1880's. I think it was 1882 when the first Polar Year was held. That was a cooperative venture on a much smaller scale.

Then 50 years later, in 1932, the second Polar Year was held. This became a somewhat larger effort and, as we all well know, we had expeditions, for example, to the Antarctic headed by Admiral Byrd.

After the Second World War, an American physicist, Lloyd Berkner, realized that there had been large and very rapid advances in geophysics and astronomy. He knew also that there was to be a

period of maximum solar activity in the years 1957-58, and he proposed that we not wait 50 years for the third Polar Year, but hold it after only 25.

This recommendation was made to international scientific bodies, and there was enthusiastic reception of the idea. The venture became of such proportions that it grew beyond the Polar Year, and it was renamed the International Geophysical Year.

The adhering body in this country is the National Academy of Sciences.

Mr. VANCE. What is the National Academy of Sciences?

Dr. HAGEN. The National Academy of Sciences is a quasi-governmental organization set up by Federal charter, I believe at the time of President Lincoln, when we were in difficulties in the Civil War.

It is made up of leading scientists from nearly all of the fields of science. They serve, among other things, to advise the Government, when requested, on scientific matters.

Mr. VANCE. Dr. Hagen, since this is a scientific project, why is it under the management of the Department of Defense?

Dr. HAGEN. When the proposal was made that some country put a scientific satellite in a semipermanent orbit around the earth as a part of the IGY, it was considered here. A special committee of the National Academy of Sciences and the National Science Foundation studied the feasibility of the project, and determined that it was feasible, with the then known techniques, to put a satellite in an orbit.

They approached the White House with the proposal. The executive department turned to the Department of Defense to implement the program because the Department of Defense had had a wide background in upper atmosphere research; and within the Department of Defense, much of the work of probing the upper atmosphere with rockets had been done at the Naval Research Laboratory. For this purpose special rockets had been designed after we had exhausted the supply of captured V-2's. The new rockets—you are familiar with the names, I am sure—were the Aerobees and the Vikings.

I think this project was put within the Department of Defense because of the experience, not only in the instrumentation and use of rockets, but in the management of this type of project.

Mr. VANCE. What was the specific job which you were given to do?

Dr. HAGEN. As the Director of Project Vanguard, the job that was assigned to me was, first, to put a satellite in an orbit within the time of the IGY; second, to so instrument it and so arrange here on the earth that it could be observed and proven to be in an orbit and third, to so instrument it that useful scientific work could be done in the satellite.

Mr. VANCE. What is the time of the IGY?

Dr. HAGEN. The IGY began in July of 1957, and will continue through December 1958.

PUTTING A SATELLITE INTO AN ORBIT

Mr. VANCE. Would you please describe the launching vehicle, and how it puts a satellite into an orbit?

Dr. HAGEN. Yes, sir. I have some charts here which might help in doing that.

The choice that was made for our participation was to build a launching vehicle developed out of the Viking rocket, which was an atmospheric research probing rocket.

In order to put a satellite in an orbit, it is necessary to do two things: The first of them is to lift the satellite the required distance above the surface of the earth, in this case two or three hundred miles; the second is one has to give it the horizontal velocity that is needed to keep it there in spite of the earth's gravity. That velocity is some 5 miles per second.

Now, the launching vehicle, of which I have a model—I think you can see it best with a model—is constructed in three parts. It is a 3-stage vehicle, some 72 feet long, and it weighs about 22,000 pounds.

The first stage is nearly all tankage for the kerosene and the liquid oxygen which we use as propellants. Down here, the small motor that develops a thrust of 27,000 pounds. After this rocket goes vertically into the air, as you can see on the trajectory over here, about 35 miles, the first stage will burn out. And since it is no longer needed, it falls off into the sea.

The second stage again is a liquid-propellant rocket, smaller than the first. It burns for another couple of minutes, and during that time the nose cone, which protects the satellite and also helps the rocket to go through the dense lower atmosphere is thrown away. The second-stage rocket then burns out and coasts for some several minutes until it is about 300 miles above the surface of the earth, and is properly oriented parallel to the surface of the earth. At that time it is nearly a thousand miles away from the launching point, and then the third stage is ignited.

The third stage is actually set spinning to stabilize it, and then it burns for thirty-odd seconds; and in that time more than half the total required velocity is imparted to the satellite, which is on the nose of the third-stage rocket. In the meantime, the second-stage casing, which has fallen away, follows a ballistic trajectory and falls into the sea some 1,500 miles from the launching point.

When the third stage has finished burning, and if it has gone in the right direction and has had imparted the necessary velocity to the satellite, its empty casing and the satellite will stay in an orbit.

We intend to separate them so that the satellite will go off by itself, and the scientific experiments will not be interfered with by the casing.

ORBITS

Mr. VANCE. I think it would be helpful if you would please tell us in a general way something about orbits.

Dr. HAGEN. I think it is best to start with the moon. The moon is in an orbit around the earth. It is a satellite of the earth. And since it is some 250,000 miles away from the earth, the atmosphere there is practically nonexistent. The moon's orbit is pretty steady and predictable.

We are now trying to make a small manmade moon. The principal difference is that it will be very much closer to the surface of the earth. We hope that our satellites, when they get in orbit, will not be closer than 200 miles to the surface at any time, and will not be farther away than about 1,400 miles.

An orbit around the earth does not necessarily have to be circular. It is circular only in a special case. In all of astronomy, the orbits

of planets around stars or of satellites around planets, in general, are elliptical. The satellite really sees the earth as a point, once it gets into its orbit, and the plane of the orbit will always contain the center of the earth.

As this chart shows, the earth turns around under the satellite. The order is top left, and then on to bottom right. Shown here four successive revolutions. The earth, spinning under the orbit, moves to such an extent that instead of passing over Cape Canaveral in Florida, by the time the first revolution is completed the satellite passes farther to the west. By the time the fourth revolution is completed, the earth has rotated so that the satellite will pass over the Hawaiian Islands and the southern part of South America. Once objects are in orbit, they are independent of the rotation of the earth, but they are carried around the sun with the earth.

Mr. VANCE. We read things in the press about the desirability or lack of desirability of circular and elliptical orbits. Could you comment on that?

Dr. HAGEN. Yes. Our purpose in putting a satellite out there is to conduct scientific experiments. We want to study the upper atmosphere, the very outermost parts of the earth's atmosphere. We also want to study the radiation coming in from the sun and from other parts of the universe, study this radiation outside of the atmosphere; our atmosphere is really an absorbing blanket, and is transparent only in the visible and parts of the radio spectrum.

To do these two jobs, it is probably just as well to have an elliptical orbit as to have a circular one. It would depend somewhat upon the specific experiment you are talking about, but in general all experiments would benefit by having the orbit elliptical rather than circular, because then you study different heights.

TRACKING SATELLITES

Mr. VANCE. How and when will you be able to tell whether the Vanguard satellites are in orbit?

Dr. HAGEN. Are in orbit?

Mr. VANCE. Yes.

Dr. HAGEN. Soon after we launch. We have a tracking system which extends down along the 75th meridian with stations all the way from near Washington, D. C., down as far as Santiago, Chile. We also have a station out on the British island of Antigua in the West Indies.

In launching the vehicle from the Air Force Missile Test Center in Florida, we are launching down along the chain of islands that is the West Indies. There is a safety problem here, and we do have to avoid going over particular islands. However, it is in that general direction.

And so, about 10 minutes after the vehicle is launched, the third stage will have burned out. If we have established an orbit, we should know it by observation at Antigua, for by that time, the satellite will be radiating from its own radio station, and will be passing over Antigua. As it goes over South Africa where there will be another minitrack station, we will get a better reading. And by the time it goes pretty nearly around the earth and goes over San Diego, Calif., we can tell with assurance.

Thus, within 90 minutes we will certainly know whether we have a satellite in an orbit.

Mr. VANCE. Dr. Hagen, how do you get information out of the satellite? How do you track it?

Dr. HAGEN. In the satellite there will be a small radio station. We call that the minitrack oscillator, the minitrack system, which is the system of radio receiving stations shown on the chart.

This small radio station is to be modulated by the information collected by the scientific equipment, the receivers placed on the ground can pick up the information, in its modulated form, demodulate it, and relate it to the readings taken by the instrument in the satellite.

At the same time, since this radio station is radiating continuously, we can effectively direction-find on it. We do this by means of fixed antennas. However, we do continuously measure the instantaneous position in space and time of the object as it goes overhead. All of this information is then rapidly disseminated over a very complex communications system back to a control center here in Washington, and when properly filtered it is sent into a computing center where the orbits are computed and predictions are made on future passages.

The overall network that we have had to set up you can see on this chart here. The outer rings are the various observation stations and each of them is connected through a communications system to the central hub of the scheme, the Vanguard Control Center. That in turn connects with or is in constant touch with the computing center, and also with the optical tracking people of the Army Map Service.

Mr. VANCE. What are your commitments with respect to releasing scientific information to be obtained during the tracking?

Dr. HAGEN. The United States has proposed, and I think basically committed itself, through the National Academy of Sciences, to the international IGY organization, to release within 2 hours of the time of a launching a statement as to its success, and as soon afterwards as possible, of course, the information about the course of the object in the sky.

Mr. VANCE. That may be any time during the International Geophysical Year?

Dr. HAGEN. As far as the orbit information is concerned, it could be any time, but it would be practically useless unless it were done soon.

VANGUARD SATELLITE LAUNCHING SCHEDULE

Mr. VANCE. Now you have stated that the objective is to establish a satellite during this year.

Could you tell us something about the launching schedule?

Dr. HAGEN. I should go back a bit, I think, and explain the development of the vehicles so that you will understand where they fit into the schedule.

As I pointed out in the beginning, we developed this three-stage vehicle to do the specific job. It is not an off-the-shelf item. We therefore had to test all of the component parts during the course of the development, and so our vehicle launching schedule is really in two parts: the first part is a test vehicle schedule wherein we flight-test the different engines that are in the series and flight-test the operation of the electronics. This part has 5 or 6 vehicles in it.

The second part of the schedule contains what we call the satellite launching vehicles. These are identical, and have the capability of putting a 20-inch, 21½-pound sphere in an orbit.

Now we are in the middle of our test vehicle schedule.

The first vehicles, intended to test the separate components, have been flown, and we are now on the verge of flying the first of the three-stage vehicles.

During the course of the early test program the flight of the vehicle testing the third-stage engine was so successful, and the operation of the engine itself was so successful, that we were able to change the nature of the remaining test vehicle program. In place of heavy nose cones filled with measuring instruments, we were able to use a 6-inch sphere, of which this is a model.

This small sphere now contains two minitrack transmitters. Putting that small light sphere on the test vehicle third-stage in place of a heavy nose cone the vehicle has the capability of putting the sphere in an orbit if all parts of the test go smoothly and the operation of all motors is up to par.

We are at that phase now. We have the first of the three-stage vehicles well along in its processing and we are readying it for launching. It will be launched sometime during the month of December. It will then be followed by two more test vehicles of the same kind.

After that, by the month of March, we will be prepared to launch satellite launching vehicles with the full-scale IGY satellite in them.

Mr. VANCE. Could you give us a general picture of the operations which will be required in connection with the launching vehicle?

Dr. HAGEN. Yes. The most difficult part perhaps of this whole program is right there. Actually this vehicle that we are using for the satellite launching is in many ways more complex than some of the single-stage missiles with which we are familiar. In preparing a vehicle like this for launching, one must go over it in minute detail and check each component part to make sure that each is completely in accord with its specifications and is operating properly. After that he must assemble the vehicle and burn the engines with the vehicle clamped down to a stand, to make sure that the sequence of operations is correct.

Before he comes to the launching he must check all of the electronics. In an automobile you have a speedometer and other gadgets on the panel which you can look at, and even those of us who are not automotive engineers need those gadgets in order to drive our cars properly. In the same way there must be gadgets in these missiles which you must read, so there is an elaborate telemetering system in the missile which broadcasts information about the operation of the various parts.

This whole electronics system has to be checked out before the vehicle is prepared for launching.

In the checkout if you put on paper, as we have done, all of the sequential operations that must occur, each successfully, in order that the vehicle get off the stand and do what it is supposed to do, the list of operations strings out to the length of the table before which you sit. All of these things then you see must be doubly checked before the vehicle flies. Then as you get ready to launch it, you must fuel the vehicle, recheck, and you are ready to go.

The picture over here is of the flight of TV-2—test vehicle 2—which is the first vehicle having the Vanguard configuration. That is, all of our vehicles now will look exactly like that. The vehicle is a second or two away from the stand in the photograph. The engine is, as you see, burning with the flame straight down. All of our tests at Patrick to date have been successful. They have more than exceeded our expectations, and it is the success of these earlier vehicles that gives us confidence that we are going to go along successfully with the more complicated three-stage vehicle.

Mr. VANCE. Dr. Hagen, prior to the launching of Sputnik I to your knowledge was any consideration given to trying to speed up the Vanguard project?

Dr. HAGEN. Yes, sir. You will recall I said we changed our launching program. The flight of the vehicle which flew the third stage for the first time, was in May of this year. After the data had been analyzed and it became clear that we indeed had in this one trial solved all the problems involved, we did that which would speed the program up and give us an orbiting vehicle at the earliest possible time, and that was to get rid of the heavy nose cone and substitute this small subsatellite. We made the decision to do that about the 15th of July, which was some months before sputnik.

PRIORITY—LIMITATION AND PROGRESS

Mr. VANCE. In your opinion have we gone ahead as fast as we could or should in our Vanguard project?

Dr. HAGEN. Well, sir, there has always been a great sense of urgency on the part of the people working in the project.

The only limitation on speed, I think, here has been that based upon the decisions made earlier on priority and on the adequacy of funding for the project.

Senator JOHNSON. What is your answer to the question, Doctor?

Dr. HAGEN. Pardon?

Senator JOHNSON. What is your answer to his question?

Dr. HAGEN. I thought I had answered it, sir.

Senator JOHNSON. I did not get it if you did.

How did you answer it?

Dr. Hagen. I would like you to ask me again if you don't think I answered it.

Senator JOHNSON. Would you restate it again?

Dr. HAGEN. I say there has been a sense of urgency always within the project and that the project has been handled within the limitations set upon it in the beginning, of priority and of the availability of funding.

Mr. VANCE. What were those limitations?

Dr. HAGEN. The limitation on priority was that the project must never interfere with our higher priority ballistic-missiles projects. It had a secondary priority classification.

Mr. VANCE. Were there any other limitations?

Dr. HAGEN. The project was funded, as you know, from the emergency fund, the Secretary's emergency fund, until quite recently when it was justified before Congress and it was then funded to completion by action of the congressional committees.

Mr. VANCE. In your opinion if these limitations had not existed, could the project have been speeded up?

Dr. HAGEN. I think if, in the very beginning, this country had decided that it was urgent to complete the satellite project at the earliest possible date and had taken the necessary actions to make this possible, certainly we could have speeded it up; yes.

Mr. VANCE. Do you think that you could have gotten it up ahead of Sputnik I?

Dr. HAGEN. The answer to that is a hypothetical one. I believe we would have had a good chance of doing that.

Mr. VANCE. What is your best opinion?

Dr. HAGEN. I think that we probably would have come very close to the same time, if not ahead of it.

SCIENTIFIC INFORMATION

Mr. VANCE. Dr. Hagen, since the object of the Vanguard project is to get scientific information, I think it would be helpful if you would explain more fully what is the scientific information which will be obtained from the Vanguard project?

Dr. HAGEN. The scientific program laid out for the satellite project in the IGY has been determined by a panel of the National Academy of Sciences.

The panel is under their Committee for the IGY which is headed by Professor Kaplan. Out of a tremendous number of suggestions as to good experiments that should be done, they have built their program around 4 satellite packages, and it is easier to explain the thing in terms of the 4 satellite packages.

Mr. VANCE. Please do.

Dr. HAGEN. Once they chose the experiment and chose the experimenters, the laboratories or the universities which would conduct these experiments, then funds were allocated to these people. The experimenters worked in conjunction with our group in project Vanguard where the instrumentation of the experiment was done.

As you can recall from the chart over there of the sphere, in the central compartment there were the minitrack oscillator, the batteries, and the modulators; these were connected to the experimental equipment with the help of our people.

In the first package, the chief experiment or the principal experiment, is that of the measurement of the ultraviolet radiation from the sun. The earth's atmosphere absorbs the principal part of this ultraviolet radiation. If it were not for the earth's atmosphere, our skins would be burned to a crisp in a short time.

The sun is very active in the ultraviolet, and it is of great interest to a great many fields of science to understand the variation in this ultraviolet radiation. And so the idea here is to put a detector of ultraviolet radiation in the satellite and let it stay up in the air some 2 or 3 weeks at the least and get sequential measurements of the ultraviolet radiation.

In addition, in that first package there are several experiments which will measure the satellite's environmental conditions. We are tremendously interested in the environment that exists outside the atmosphere. Our interests—we will probably say more about that later—can best be served by making the direct measurements as early as possible. So in this first package we will be measuring temperature, pressure, erosion of the surface by micrometeors.

There will also be microphones on the package which will detect individual collisions with micrometeors. By these means, then, we will study the outside atmosphere.

Senator JOHNSON. Dr. Hagen, if you will permit, the committee will take a recess until 2:30.

We will resume at this point at 2:30 p. m.

(Whereupon, at 1 p. m. the committee was recessed, to reconvene at 2:30 p. m. of the same day.)

AFTERNOON SESSION

Senator JOHNSON. The committee will come to order.

For the information of the members of the committee and the press, at the conclusion of Dr. Hagen's testimony, we will go into executive session and meet in the Armed Services Committee Room to hear the Director of Central Intelligence, Mr. Allen Dulles. At the conclusion of his testimony I will meet with the press and tell them anything that I may be able to as a result of that testimony.

Dr. Hagen, we appreciate very much your coming back to be with us this afternoon.

We are very proud of the quality of testimony that has been adduced thus far in the hearing.

We have had witnesses whom we believe are dedicated to the best interests of this Nation. They did not come from the White House or the Pentagon or Congress. They came from all walks of American life.

Before these hearings are concluded, we are going to ask each branch of the military services, the Army, the Navy, and the Air Force to come and testify. They will receive a full opportunity to present all facts relevant to this inquiry in both open and closed hearings.

Each branch of the military service has already been examined by the staff of this committee, and further examination will take place within the services between now and the time the committee resumes on December 13.

To illustrate, in the Navy, Secretary Norton, Admiral Burke, Chief of Naval Operations, Admiral Clark and Admiral Hayward in charge of research and development, Dr. Thomson, civilian research adviser, and many other officers and advisers have been interviewed.

The Navy will get a full opportunity to present its case to us in both open and closed sessions.

In the Army, General Medaris, General Gavin, Dr. von Braun, the head of the Jupiter missile project at Redstone; Dr. Martin, civilian head of research and development of the Army, as well as many other Army officers and civilians, have been interviewed.

The Army will be given every opportunity to present its position to this committee fully and adequately in open and closed sessions.

In the Air Force General White, General LeMay, General Putt, the head of research and development, both military and civilian, have been interviewed. As in the case of the Navy and the Army, the Air Force will get every opportunity to present its case before us.

I think that all of you must realize a great many man-hours have gone into interrogation and interviewing prior to the presentation of the witnesses.

The defense and budget departments have been studied by our staff. These departments will be fully examined to give them every opportunity to present all relevant facts to this committee.

This Preparedness Subcommittee will reach no premature conclusions and has no preconceived notions. When all the facts are presented they will be studied and a fair report of recommendations and conclusions will be made to the full committee in the event the subcommittee feels that it is desirable and in the national interest to do so.

Dr. Hagen, we thank you for indulging us. Counsel, will you proceed with the examination of the witness?

TESTIMONY OF DR. JOHN HAGEN—Resumed

VANGUARD SATELLITE EXPERIMENTS

Mr. VANCE. Dr. Hagen, would you please continue with your description of the experiments in connection with the Vanguard project?

Dr. HAGEN. As I recall, I said there were four separate packages, and I think I have described the first.

The second package was to have been a cosmic-ray experiment. The factors back of the experiment are these: Cosmic rays are particles coming in from outer space at high velocity. They do not penetrate our atmosphere in their primary condition. They come into the atmosphere, collide with the molecules of the atmosphere, and then secondary cosmic rays strike the earth.

In order to have a complete understanding of these cosmic rays and from that a better understanding of the universe, we need to study the primary cosmic rays outside the atmosphere; so in this second satellite there were to be detectors which would measure and study the primary cosmic rays. In addition, in this package, there was planned a meteoric detection experiment.

Now, the program has recently been changed, and in place of this cosmic ray experiment, which now goes over to the Army program, we have substituted a meteorological experiment which is being conducted by the Signal Engineering Laboratory of the Army. In this experiment there are 2 or 3 photocells in the satellite, of a rather simple telescope type construction. As the satellite spins and revolves around the earth, they scan the surface of the earth to give us a picture of the cloud cover around its equatorial belt, within the hundred minutes or so that it takes the satellite to complete an orbit.

This is a very important thing for the meteorologist. Never before has it been possible to calculate the total heat input into the atmosphere and thereby make a scientific study of the heat engine which is the atmosphere, and therefore be able to predict the weather more precisely.

(At this point a light bulb fell from a chandelier before the committee table.)

Dr. HAGEN. I think that was the casing. [Laughter.]

Senator JOHNSON. Is that a part of your project?

Dr. HAGEN. No, sir; I think that is one of those strange flying objects. [Laughter.]

Well, in any event, then, there is this second experiment which is now meteorological and will give us a much better understanding of the earth's weather.

The third package is one containing magnetometers which will allow us to measure the earth's magnetic field at some distance above the earth. This experiment is being conducted by the Naval Research Laboratory.

As you may know, the earth's magnetic field is due not only to processes within the earth, but also to currents in the ionosphere. The earth's field varies and causes us some difficulties in communications. It is important to understand what causes these variations. One of the theories is that there is a ring of current in the ionosphere which has an intensity of thousands of amperes and is caused by the electrons and protons coming from the sun.

The measurement of the field with the satellite at a height of 200 or 300 miles will allow us to determine whether in fact there is such a current, and thereby to have a much better understanding of the earth's magnetic field.

The fourth package is a meteorological experiment in which the University of Wisconsin is placing radiometers out at the ends of the satellite antennas. These radiometers will measure the total radiation from the sun, the reflected radiation from the earth, and the earth's heat radiation. All of these things together, then, in conjunction with that second experiment, will give a much, much more complete picture of the earth's weather.

Now those are the four particular experiments that are planned for the IGY and, as you can see, they are all geophysical experiments. This program was designed in the beginning as, and is being conducted as, a geophysical experiment with some astronomy.

There are other experiments that should be done before a man could safely go up into space. Some of these are the environmental experiments that were referred to in the first package.

There are other things like the problems of recovery, of navigation, of a more complete picture of the high energy radiation, of the effects of weightlessness, and things of that nature, all of which should be studied before we think of going beyond the IGY series of satellite experiments.

Mr. VANCE. It is your recommendation that this should be done?

Dr. HAGEN. I surely do recommend that it be done, and that a very carefully coordinated program be set up as soon as possible to see that we do go into it in a well-thought-out and planned way.

VANGUARD PRIORITY REQUEST

Mr. VANCE. Before going into the next topic, I want to ask you, Dr. Hagen, whether or not you ever asked for top industrial priority with respect to the Vanguard project?

Dr. HAGEN. Early in the project—I think I explained earlier that those of us in the project have always had a sense of urgency about this thing—we did request top priority or high priority for the project so that we could get along at the maximum possible speed.

Mr. VANCE. When did you make that request?

Dr. HAGEN. I cannot give you the exact month, but it was sometime late in 1955 or early in 1956.

Mr. VANCE. To whom did you make the request?

Dr. HAGEN. Well, in the organization in which we work, our requests go through the Office of Naval Research and from there they go on up through the Navy Department to the Department of Defense.

Mr. VANCE. Was your request granted?

Dr. HAGEN. No; it was not, in the form in which we asked it.

Mr. VANCE. Do you know who made the decision not to grant it?

Dr. HAGEN. I do not know.

Mr. VANCE. Did you subsequently make any recommendations with respect to speeding up your launching schedule?

Dr. HAGEN. Yes; we did.

If you will recall, I said that the flight of this third stage was extremely successful, and at that time we saw an opportunity to advance the date when we could possibly put an object in an orbit, and the way we could do that within the program as it then stood was to change the later vehicles and put the small satellite on them.

I think it is obvious, in answer to a question that I think Senator Johnson was after earlier, that had this project in the beginning been conceived of as a top priority project, then certainly we would have gone ahead faster than we did under the limitations under which we worked.

Mr. VANCE. That was your recommendation?

Dr. HAGEN. Yes.

REQUESTED LAUNCHING SCHEDULE SPEED UP

Mr. VANCE. Now you spoke of this second recommendation, speed up the launching schedule.

To whom did you make that recommendation?

Dr. HAGEN. By that time, the Department of Defense had named Mr. Holaday as the special assistant for guided missiles and this program was placed under his cognizance, so this recommendation was made directly to Mr. Holaday.

Mr. VANCE. When?

Dr. HAGEN. Approximately the 15th of July of this year.

Mr. VANCE. What happened on that recommendation?

Dr. HAGEN. Mr. Holaday investigated the recommendation, and soon agreed that it was a wise move for us to make, and so we immediately proceeded. Our actions, I think probably started around the first of August.

Mr. VANCE. And your recommendations were fully carried out in this later aspect?

Dr. HAGEN. Yes; we have fully carried out this recommendation.

MILITARY BENEFITS

Mr. VANCE. Now so far we have talked about the scientific advantages of the satellite. Could you tell us something about the military benefits to be gained from a satellite?

Dr. HAGEN. Yes. I think that to discuss fully the military advantages one would have to have a closed meeting, but I think it should be pointed out that the defense of this country in the technological age in which we live benefits from every scientific and every engineering

advance, and it is therefore to the advantage of the Department of Defense to carry forward work like this even though there may be no immediate military justification of the program.

Mr. VANCE. You feel you could go no further in open session?

Dr. HAGEN. I could only mention a few things that are of obvious advantage. One is that satellites, close-in satellites, can certainly be excellent aids to navigation. Within the Navy we have this navigation problem. The problem is not confined of course to the Navy but we are very aware of it. Close-in satellites can help in navigation. They could also help in such things as television relays.

Mr. VANCE. What are they?

Dr. HAGEN. You can place a satellite in an orbit some 22,000 miles or so above the earth, at which time it has a period of just 1 day. So you could place it over the United States, for example, and if you instrumented it as a television relay station, you could feed television programs into the satellite and have them rebroadcast to cover the whole of the United States with one transmitter. This is an obvious thing which will be done some day and it certainly has its military advantages.

Another thing that is of extreme interest to the military is one that I referred to earlier. It is of extreme importance to understand the conditions that exist several hundred miles above the surface of the earth, because certainly it is through these regions that not only instruments in our missiles but, later, men are going to travel, and you must understand the conditions before you can safely do this.

Mr. VANCE. Are there any further comments you wish to make?

Dr. HAGEN. I think that is as far as I should go.

RUSSIAN SATELLITES

Mr. VANCE. With respect to the Russian satellites I would like to find out how much we know about them.

First of all, how much have the Russians told us?

Dr. HAGEN. The Russians have told us very little in a direct fashion about their satellites. I think the most direct information we have was given at a meeting here in Washington in September, at which time we were told of their plan to put a spherical object in an orbit. It was well described, that is, it was described as 23 inches in diameter and weighing 184 pounds. We were not, of course, told at that time anything about their dates.

Mr. VANCE. Were the Russian satellites a part of their IGY effort?

Dr. HAGEN. The first report on the first satellite was, no, that it was a test sphere, but later this was withdrawn and now I think they have named both of their satellites as a part of the IGY.

Mr. VANCE. Then have they submitted any scientific information?

Dr. HAGEN. No; no scientific information, to my knowledge, has been submitted. The proper channel for that, is to submit this information to the international IGY organization in Brussels. All of the adhering nations have agreed to do this. But I should point out that there is no time limit on this agreement. This is understandable, because it takes different amounts of time to reduce different kinds of data.

The only thing we can say here is that we must wait and see whether the Russians do report the scientific results that they have obtained.

Mr. VANCE. What should the Russians tell us under the IGY agreement?

Dr. HAGEN. Under the IGY agreement, they should tell us what the experiments were, they should tell us what the results were, and show us the data. They should describe the vehicle, that is, the satellite itself, in which the experiments were located. But they are not required, under the agreement, nor are we, to describe the launching vehicle.

Mr. VANCE. Did they tell us within the required time that they had launched Sputniks I and II?

Dr. HAGEN. So far as I can determine, I think they did. Their announcement was, seemed to have come within the time of the first orbit, and that was about, well, within 90-odd minutes.

Mr. VANCE. And the requirement is 2 hours?

Dr. HAGEN. The requirement is 2 hours.

Mr. VANCE. From our own observations of the Russian satellites, what have we learned?

Dr. HAGEN. We have learned quite a bit. There are two classes of experiments that can be done with a satellite. This I should have pointed out earlier in conjunction with our own program, and suppose I take a minute and do this.

One class of experiment deals only with observing the satellite, whether it be observed by radio or by optical means.

When a satellite is in an orbit around the earth, there are two things which keep that orbit from being a permanent orbit, and being held in a fixed plane in space.

First, there is the attraction of the earth's equatorial bulge. The earth is bigger at the Equator than it is at the poles. This bulge tends to pull the orbit over, and when you try to do that, instead of falling over it precesses or turns exactly as a gyroscope does. So by observing the rate at which orbits precess, you can learn something about the ratio of the polar and equatorial diameters of the earth, and there is a very important thing from both the military and civilian point of view.

The other kind of perturbation or change is that due to what is left of the atmosphere when you get out that far. I should point out that at that distance above the surface of the earth, the pressure is about the same as it is inside a well-evacuated radio tube. There is very, very little gas, but there still is enough so that there is a drag effect on the satellite. Now, by observing the rate at which the orbit decays, one can determine the density of the air at these great altitudes.

PERIGEE AND APOGEE

Mr. VANCE. Just a minute, Doctor. By "decay," what do you mean?

Dr. HAGEN. By "decay," I mean this: Remember, I said orbits were mostly elliptical. They come close to the earth. That is called perigee. And on the other side, called apogee, they might be a thousand miles away from the earth as you can see from the chart over here.

As the energy is taken out of the orbit by the drag of the atmosphere, the apogee descends, the orbits decay, or shrinks in size, and the satellite eventually comes into the denser atmosphere; if it is a light shell,

such as this one, it will burn up, just as the meteor does. So, by observing the rate at which that orbit changes, you can determine the density of the atmosphere.

TRACKING RUSSIAN SATELLITE

Well, now, coming back to your original question: The Russian satellite is available to us to make this kind of observation, and this we are doing. We have already arrived at conclusions about the density of the atmosphere from observations of the rate of decay of the orbit, and we have a confirmation of the shape of the earth.

This information is approximate only, because the Russians chose a very poor frequency for the observation of the satellite in orbit. They chose a low frequency which could be easily heard by amateur radio enthusiasts and anybody with a shortwave radio, but it does not lend itself to accurate tracking. We therefore have not had extremely accurate tracking of these satellites such as we hope to get with our own, and we therefore do not have the geodetic information that we might have had.

Mr. VANCE. By "geodetic information," what do you mean?

Dr. HAGEN. Information on the shape of the earth and the mapping of the surface of the earth.

Mr. VANCE. With respect to the first Soviet satellite which was launched on October 4—

Dr. HAGEN. Yes.

Mr. VANCE (continuing). Explain what you can about it, its orbit, configuration, and so forth.

Dr. HAGEN. That satellite was launched at approximately 5:30 in the afternoon of the 4th of October. After it was in orbit, the satellite was separated from the rocket casing, which was the last stage of the rocket. The casing is obviously much larger than the satellite. Very, very few people have seen that satellite, but I am sure many in this room have seen the rocket casing.

From the rate of drag on the casing, which depends upon the ratio of the mass of the object to its area or size, and from the relative rate of drag for the satellite itself, we can draw rough conclusions as to the dimensions of the casing. If we add to that the information that can be obtained from simply observing it in reflecting sunlight and estimating the size from its brightness, we can say that it was a fairly large rocket which pushed this satellite aloft.

The casing, however, being larger than the satellite, had its orbit destroyed earlier and, as it fell in closer to the earth, went faster and faster, and got ahead of the satellite. At the present time, it is down pretty low. I do not know the precise number, but it is on the order of 120 miles or so, and it will not be very long, it will be a matter of weeks, before that comes all the way into the atmosphere and disappears as a meteor.

Mr. VANCE. How about the nose cone and the satellite itself?

Dr. HAGEN. The nose cone, we have lost track of, to my knowledge. It has probably come into the atmosphere long before this. The satellite itself, being a compact, massive thing, will stay up for a much longer time. It will be next spring before that comes into the atmosphere, I am sure.

Mr. VANCE. What conclusions, if any, can you draw, with respect to their guidance system, from the projecting of the two satellites in orbit?

Dr. HAGEN. I cannot draw too many conclusions about guidance without making certain assumptions. If we were to assume that they were shooting for an exact circular orbit, then you can draw some conclusions. However, as I pointed out earlier, there are advantages to elliptical orbits. So, we can only assume that they built in sufficient excess velocity to get an elliptical orbit. Therefore, the only conclusions you can draw are that their guidance is good enough to do that, and that is something on the order, in terms of angle, of a degree or so. Whether it is, indeed, finer than that, there is no way of knowing.

Mr. VANCE. Now, with respect to the second sputnik, which was launched on November 2—

Dr. HAGEN. Yes.

Mr. VANCE (continuing). What can you tell us about that?

Dr. HAGEN. Well, as you all know, this was handled in a different fashion. There was no separation. The experiments, which they reported weighed some thousand pounds, were left intact in the nose of the vehicle, so that the second satellite is as bright as the casing of the first vehicle.

With this satellite, they did not achieve as nearly circular an orbit as they did in the first. It was lower in the sky, to begin with, although it had a greater apogee. The perigee figure, I think, was 140 miles, and the apogee more like 1,100 miles. The second rocket, then, has had its orbit modified more rapidly than the first.

In addition to the dog with which we are now all familiar, they did say they had other experiments there, experiments on solar ultraviolet and cosmic rays, bearing a marked similarity to the scientific program that we have planned.

The radio transmitters in both of these lasted for just a short time. In the first case, the radio transmitter died out in some 3 weeks. In the second case, it lasted for an even shorter time. I believe that it was about 7 days after the satellite was launched that the radio transmitter failed. It was on the 8th of November that it failed.

Mr. VANCE. How long will this stay up?

Dr. HAGEN. This one will stay up, I feel, for certainly another several weeks, and maybe a month or two.

Mr. VANCE. What conclusions, if any, can we draw with respect to guidance from Sputnik II?

Dr. HAGEN. No more, I think, than from Sputnik I. Again, it is a matter of knowing what their aim was in the beginning, and this we do not know.

Mr. VANCE. You mentioned accuracy within a degree. Would you amplify on that a little bit?

Dr. HAGEN. Yes. In our case, where we are designing from the beginning to put a satellite in an orbit, we have determined that if we have a guidance accuracy of about $1\frac{1}{2}^\circ$, that, with the velocity excess we have at hand, we will safely put the satellite in a useful orbit.

Looking at the orbit that they achieved, if we assume that they started along the same avenue, then they could have been satisfied with the same guidance accuracy, and this is, of course, a much looser

accuracy than is required for the kind of things that you are primarily interested in.

Mr. VANCE. The ICBM?

Dr. HAGEN. Yes.

Mr. VANCE. What sort of accuracy is required there?

Dr. HAGEN. I couldn't give you the exact number at this meeting.

Mr. VANCE. But it is less than a degree?

Dr. HAGEN. It certainly is much less than a degree.

Mr. VANCE. Now, can you tell us anything about the rocketry used to launch these two satellites?

Dr. HAGEN. Just based on certain assumptions. The only thing that I think I could tell you here is that there is every indication that they are well advanced in the area of propulsion; that the rockets that put both of these satellites in the air were probably similar. It looks very much to us as if they had attacked this part of their ICBM problem with vigor and, certainly, with all the resources at their command.

Mr. VANCE. Can we draw any conclusions with respect to the amount of thrust which is required to get this into orbit?

Dr. HAGEN. We can. But, again, I would not want to discuss the thrusts here. The thrusts are on the order of the thrust that you would require for an ICBM. Maybe, at this time, I should point out something here. We seem to be getting by with a small thrust, 27,000 pounds. This is because the rocket that we are using is designed specifically to put a satellite in an orbit. The rocketry that they are using is obviously not. The rocketry they are using comes out of their military programs.

JUPITER-C AND VANGUARD PROGRAM

Mr. VANCE. Dr. Hagen, on November 8, 1957, it was reported in the public press that Secretary McElroy had announced the Army would supplement the existing Vanguard program by launching earth satellites using the Jupiter-C rocket as the launching vehicle. What do you know about this?

Dr. HAGEN. Well, this program, as I understand it, was announced as a backup program for Project Vanguard. It was an attempt on the part of the Department to doubly insure that we were ready with our IGY commitments in March.

Mr. VANCE. What connection, if any, would you have with this Army satellite?

Dr. HAGEN. We have no connection with the missile aspect of the Army program. We do have an indirect connection in the science program. As I pointed out earlier, the second scientific experiment, the cosmic-ray experiment, is now being put into the Army program, and we are also supplying some of the instrumentation that will go into the satellite the Army will use.

Mr. VANCE. You will work with the Army on that?

Dr. HAGEN. In this way; in the field of the scientific instrumentation.

Mr. VANCE. Is that the extent of the cooperation you will give?

Dr. HAGEN. At the present writing, we are not involved with them on rocketry.

Mr. VANCE. Just what is the relationship of the two programs? Are they independent, or are they supplementary?

Dr. HAGEN. They are being coordinated by Mr. Holaday's office, and the intent here is to take the device which the Army has and bring it along in time to make a true backup to the Vanguard for the March commitment.

Mr. VANCE. Do we have any information with respect to launching schedules of the Army satellite?

Dr. HAGEN. No, sir. I do not have any official dates on their schedule.

Mr. VANCE. Is there any other comment you would like to make, Dr. Hagen, on anything which I have not asked you?

Dr. HAGEN. No, sir. I think we have gone pretty much down the road.

Oh, yes; there is one other point I should make, which is in the area of cooperation. It is clear now that all of the United States satellites will be tracked by the Vanguard minitrack system. The Army satellite will have in it instrumentation and a radio transmitter which is compatible with our system so that we can do the tracking.

Mr. VANCE. Mr. Chairman, I have no further questions.

Senator JOHNSON. Mr. Weisl, do you have any questions you would like to ask?

Mr. WEISL. No, sir.

RUSSIAN SATELLITE AND IGY

Senator JOHNSON. Dr. Hagen, from a psychological and political standpoint, would it not have been of the highest importance to our own position in the world to put a satellite in orbit ahead of the Russians?

Dr. HAGEN. That is my personal opinion. I certainly believe so; yes.

Senator JOHNSON. From the political standpoint, from the scientific standpoint, from the psychological standpoint, we have suffered as a result of their launching the two sputniks ahead of us?

Dr. HAGEN. In most of those areas; yes. I am not so sure about the scientific standpoint. I think that the point here is that one should wait until the end of the IGY, and then take stock and see whether the program that this country has set out has produced scientific information of value that is comparable with, better than, or worse than that the Russians have.

Senator JOHNSON. When did the Russians tell us that they would launch a 184-pound satellite?

Dr. HAGEN. The first time that the Russians told us that their satellite would weigh 184 pounds was at the meetings of the National Academy in September of this year. They did not, however, tell us when the launching would be.

Senator JOHNSON. But they did tell us in September this year that they were going to launch a 184-pound satellite?

Dr. HAGEN. Yes, sir.

Senator JOHNSON. When did we inform the public?

Dr. HAGEN. Of this fact?

Senator JOHNSON. Yes.

Dr. HAGEN. On that same day. There were newspaper reporters in the room at the time.

Senator JOHNSON. And the press carried the Russian notification to us?

Dr. HAGEN. Oh, yes, sir.

Senator JOHNSON. What date was that?

Dr. HAGEN. This was some day around the 20th of September. I am not sure of the exact date.

Senator JOHNSON. Would it be possible to launch a satellite of greater weight than the Vanguard satellite with the Vanguard launching equipment, and would there be any scientific advantage in doing so?

Dr. HAGEN. With an improvement in the third stage engine, which we now know how to make, yes, it would be possible to launch a satellite of greater weight, and it would certainly be of advantage to us to do so. We would be able to do more things with it than we can with our present satellite.

Senator JOHNSON. I think you stated the Vanguard program was wholly a scientific program, and was given no priority. Is this the customary method followed by the Department of Defense in carrying out basic scientific research?

Dr. HAGEN. I think in the main, yes, although I must admit I am not aware of the priority of all the programs in Defense.

Senator JOHNSON. Russia is a member of the IGY, I believe you testified.

Dr. HAGEN. Yes, sir.

Senator JOHNSON. And each member was required by agreement to inform the others of the launching of a satellite.

Dr. HAGEN. That is correct.

Senator JOHNSON. And Russia did this.

Dr. HAGEN. Yes, sir.

Senator JOHNSON. You feel she complied with her agreement in toto concerning revealing scientific information as she was required to do by the agreement?

Dr. HAGEN. I think we will have to wait and see before we can answer that question. Remember, there was no time limit placed upon the supplying of information about the scientific experiments. It can be said that she has not been as cooperative in that way as this country has been, but legally, I think she may well be still within her rights.

Senator JOHNSON. Viewing this whole thing in retrospect now, you think we took a calculated risk and we lost?

Dr. HAGEN. I think that is a fair statement; yes.

Senator JOHNSON. Thank you, Doctor.

Senator Bridges?

DIFFERENCE BETWEEN ARMY AND NAVY ROCKET

Senator Saltonstall?

Senator SALTONSTALL. Thank you, Mr. Chairman.

Dr. Hagen, if I as a layman might ask you several questions that are difficult for me to express: One thing I did not understand from listening to you, why did your experiment start out with a different form of rocketry than the Army?

In other words, if the Russians were using their military rocketry, and were getting satisfactory results, why did we use a less effective smaller form of rocketry?

Dr. HAGEN. I think the answer to that is this: That you have to look back to the summer of 1955, because it was at that time that the problem was put, and at that time we did not have proven military rockets of the IRBM type that were available for this purpose. Of the various rockets that were available, each of the services had an opportunity to make a recommendation to a committee which was established by the Department of Defense, and which studied the problem.

The Committee decided that of all of the proposals made, the proposal made by the Navy stood the greatest chance of giving the scientists the kind of vehicle that they needed to do their scientific work.

Senator SALTONSTALL. Then it was not lack of coordination between the services, but a determination at that time that this Navy rocket was the best one for this purpose?

Dr. HAGEN. Yes, sir; that is exactly right.

Senator SALTONSTALL. I would like to ask this question—Mr. Chairman, I yield to you for a moment.

PRESIDENT EISENHOWER'S ILLNESS

Senator JOHNSON. The committee has just been informed by a press bulletin that President Eisenhower has suffered another form of heart attack. This bulletin states:

Judging from a statement issued by the White House the President could be described as the victim of a cerebral attack, but the White House physician, Maj. Gen. Howard Snyder, relayed word to reporters that the President, in his judgment, had not suffered a cerebral hemorrhage.

Of course this is very distressing news to all of us, I know that each member of the committee feels as I do, that we hope that he is not seriously ill. The President has our prayers for an early and I hope complete recovery.

Thank you, Senator Saltonstall.

We will go on with the hearing.

WEIGHT AND THRUST—UNITED STATES AND RUSSIAN

Senator SALTONSTALL. Thank you, Mr. Chairman. You express my feelings.

Dr. Hagen, do you believe that the Russians have gained anything in the development of an ICBM or an IRBM by launching their satellite, particularly with respect to the reentry problem?

You talked about guidance and you talked about rocketry.

Now as I understand it, the other two points, if you want to make them, are accuracy and getting it back through the atmosphere, I am asking you now about the atmosphere.

Dr. HAGEN. Well, it is not clear to me that they stand to learn anything concerning reentry through the satellite experiment. They made no attempt to recover that dog, for example.

Senator SALTONSTALL. Now, I would like to know the weights. As I understand it, the weight of your proposed satellite is 21½ pounds?

Dr. HAGEN Yes, sir.

Mr. VANCE. And the Russian's first satellite was 184 pounds?

Dr. HAGEN. That is correct.

Mr. VANCE. And the second one was what?

Dr. HAGEN. It was nearer—well they did not make it clear what the exact weight was. They did say that there were approximately a thousand pounds of equipment up in the nose of the rocket.

Senator SALTONSTALL. Was our weight at 21½ pounds chosen because of the amount of rocketry that we had?

Dr. HAGEN. In a way, yes. It was chosen as the best compromise that could be made between the kind of rocketry that we had to start with, and the time element with which we were dealing, and the magnitude of the experiment that the country wanted to get into.

Senator SALTONSTALL. Yes. So there is no military significance of any great weight in the fact that they have shot up a satellite that is much heavier than ours?

Dr. HAGEN. It does not reflect upon our ability in military rocketry. There is a military significance in that it shows that they have capabilities with these big rockets.

Senator SALTONSTALL. In other words, what we do know is that they have the thrust power?

Dr. HAGEN. Yes, sir.

Senator SALTONSTALL. Which is so important?

Dr. HAGEN. Yes, sir. This is correct, yes.

Senator SALTONSTALL. And by using our Army rocketry do you believe that we have an equivalent thrust power?

Dr. HAGEN. Now, sir, I would like to understand you exactly, do you mean by our Army, the Jupiter-C?

Senator SALTONSTALL. Well, is it the one that you are using?

Dr. HAGEN. The one that we are using is based on the Viking rocket. It has a thrust of some 27,000 pounds and is a finely designed rocket.

Senator STENNIS. Will you suspend until we get order here? We actually cannot hear the witness and actually have not been able to.

Senator JOHNSON. I am sorry, I did not know that.

The disturbance comes from the television cameras.

Senator STENNIS. You can't realize that. I just cannot hear the witness.

Senator JOHNSON. Could I appeal to the technicians on my right to cooperate with us during our consideration of the witness' testimony?

I have had other Senators speak to me about it.

We want to be as cooperative as possible, but the first purpose of the inquiry is for the Senators to get information. If they cannot hear the witness because of either work being done or private conversation, we will have to take steps to insure that they can hear the witness.

Senator Stennis, I beg your pardon, I am sorry I did not know about it. I hope you won't be so patient next time. If you will call it to my attention, we will either clear up the noise or clear out the cameras.

Proceed, Mr. Saltonstall.

Senator SALTONSTALL. Mr. Chairman, may I repeat my question, and I have lost track of time but I have two questions.

Senator JOHNSON. Senator, you proceed in your own discretion.

Senator SALTONSTALL. Thank you. Mr. Weisl has just told me that you could put, as I understood him, 2 or 3 of these rockets in together and that would give you a much greater thrust.

Dr. HAGEN. Yes, sir.

Senator SALTONSTALL. So the fact that the Russians have this thrust, is not significant beyond the fact that we know they have it.

They haven't any thrust that is particularly greater than ours, in your opinion?

Dr. HAGEN. It is very hard to come back with a very clear and concise answer to that. It is clear, I think that the Russians have large propulsive power. They have that power, and they have been using it.

The point is, or the point I was making, is that we were comparing potatoes and peas here when we compare with they are doing with our Vanguard experiment, because our rocketry for this is not a military rocket, and we should not draw conclusions about our military capabilities in this comparison. I think that you have to go outside to do that.

SATELLITE-GUIDANCE ACCURACY

Senator SALTONSTALL. Well, thank you.

Just one more question.

Mr. Vance asked you this question in a little different form but it is not clear in my mind. I read in the newspaper, for instance, that some scientist was quoted as saying that the Russians' ability to shoot this satellite into its orbit indicated a guidance accuracy of 5° , as I understood the article.

Now you say that this was about a degree, and then you say what we are interested in in ballistic missiles, I think I quote you correctly as saying, that it is less than a degree?

Dr. HAGEN. Yes, sir.

Senator SALTONSTALL. Could you describe a little more accurately, perhaps with your chart, what you mean by that, because it is not clear to me at all?

Dr. HAGEN. I don't know that I have a chart here that shows that particular thing, but maybe I can do it with gestures.

The angle that you are worried about is the pitch angle in the rocket. If you have lots of excess velocity, maybe it would be 2,000 feet per second, something on that order, then you can afford to make an error of 5° in this pitch angle and still have an acceptable orbit. However, your excess velocity is lower than that, and in their first rocket it was—it was only 600 feet per second—then the allowable error is about 1° in round numbers.

For a ballistic missile, however, where you are aiming at something thousands of miles away, and you must hit it within a mile or so, then the allowable error is an order of magnitude smaller than that.

Senator SALTONSTALL. In other words, your only interest in a satellite is to have a sufficient speed with whatever margin of error in guidance you needed to keep it in its orbit?

Dr. HAGEN. Yes, sir; exactly.

Senator SALTONSTALL. With a ballistic missile, you have got to have it much more accurate because it has got to come up and down again at a certain point?

Dr. HAGEN. Yes, sir, and hit a target.

Senator SALTONSTALL. And hit a target?

Dr. HAGEN. Yes, sir.

Senator SALTONSTALL. So the guidance on that must be much more accurate?

Dr. HAGEN. Much finer.

Senator SALTONSTALL. Have we any evidence from this satellite of the guidance that the Russians may have?

Dr. HAGEN. No, sir; not in that context. The only thing we can do is draw very, very general conclusions and say that it was at least as good as about 1°, and that is interesting to the satellite problem, but it is not interesting to the other.

Senator SALTONSTALL. Thank you, Mr. Chairman.

Thank you, Dr. Hagen.

Senator JOHNSON. Senator Bridges was detained by a phone call when his time came for questioning.

I wonder if he has any questions.

Senator BRIDGES. No question, Mr. Chairman.

Senator JOHNSON. Senator Byrd?

Senator BYRD. Thank you very much, Mr. Chairman.

Senator JOHNSON. Senator Kefauver?

NUMBER OF SCHEDULE CHANGES

Senator KEFAUVER. Thank you, Mr. Chairman.

Dr. Hagen, how many times have we revised our schedule for the launching of this satellite?

In other words, in June of 1957, did you not somewhere say that it would be launched in October of this year, and in October you revised it to March, and now you have a smaller one and—or is this the small one that is revised in March?

Dr. HAGEN. No, this is the smaller one, and it is scheduled to go in December. Now as to the number of times that we have changed the schedule, I might say that it has been a good many times. We periodically review the status of the work and have tried to keep our plans for launching consistent with the status of the work.

At the very beginning of the project, at the time when the specifications were first definitively laid out, which was in March of 1956, we projected the date of October 1957. And this date has changed several times, I don't recall the exact number of times, in the interim. We do report these dates in a classified manner to the Department in our monthly reports.

Senator KEFAUVER. Wasn't it your Captain Metsger who said in June that you expected to launch it in October?

Dr. HAGEN. In June of 1957—

Senator KEFAUVER. June of 1957.

Dr. HAGEN. I am sorry, I don't recall, and I should have seen that testimony, the exact wording there, but at that time, I am not sure. I would have to have the record in front of me of our scheduling to know whether by that time we had changed the planned date for the first launching from October.

My recollection is that we had.

Senator KEFAUVER. Well, June 3, 1957, you were present when Captain Metsger said that?

Dr. HAGEN. Yes.

Senator KEFAUVER. It will be the first artificial satellite.

Was that your thinking at that time?

Dr. HAGEN. This is the point that I was making. I am not sure of the dates of the actual changes in our schedule. I would have to look at the records to make sure. It seems a bit late for that date.

Senator KEFAUVER. Well, this is the hearing of June 3, 1957, before the Appropriations Subcommittee.

Did you not have information that the Soviet were about to launch their satellite?

Dr. HAGEN. No, sir. I have never had information, and certainly not at that time, that the launching of the Soviet satellite was in any way imminent.

Senator KEFAUVER. Well, sir, you reportedly said at the Press Club on October 11 that the satellite could have gone up earlier but then it was a question of who made the decision against giving Vanguard a priority status.

Your answer in a very general way, the Department of Defense.

What did you mean by that, that—will you explain that?

Dr. HAGEN. Yes.

We, being a part of the Department of Defense, received our directions from the Department of Defense.

The enabling letter which started us on our way and cited the priorities under which we would operate came from the Deputy Secretary of Defense.

Senator KEFAUVER. Who was that?

Dr. HAGEN. Mr. Robertson at that time.

Senator KEFAUVER. Well, then, these decisions did cut back the priority of the satellite so that you could have launched it—

Dr. HAGEN. It did not cut it back. It just was never set up that high to begin with. It never was at a high level. It started out at a level which would not interfere with a higher priority ballistic missile project.

Senator KEFAUVER. If it had a higher priority could you have had it in orbit in 6 months or a year before the sputnik?

Dr. HAGEN. I would not want to say precisely how much sooner, but I would want to say that had we in the beginning been given the priority and the things that go with priority, which are men, materials, funds—had we had those in the beginning, we would certainly have improved the dates that we presently have, and I think we certainly would have been ahead of the Russians.

FUNDS

Senator KEFAUVER. Well, Congress has given you all the money you asked for in this field, for this program.

Dr. HAGEN. I think this is—

Senator KEFAUVER. You asked for 35—

Dr. HAGEN. That is certainly correct, yes.

Senator KEFAUVER. You asked for \$35 million and then withdrew the request; did you not?

Dr. HAGEN. No. We did not really withdraw the request.

This program was funded in the beginning out of the Secretary's emergency fund. There never was a price tag on the project per se.

The procedure was that we would go to the Department with a budget for our operations and make a request for funds for the remainder of that particular year, and some months, it would be 2 or 3 months after the request, the funds would be forthcoming.

This kind of financing went on until, I think it was June, July, and August of this year, when we came before the Congress, the Chief of Naval Research, Admiral Bennett, presented the budget to completion for the project, and this is when that 34.2 figure came up.

Senator KEFAUVER. The point is you got all the money of Congress that you requested?

Dr. HAGEN. Yes, sir, I think this is right.

DOD SATELLITE COMMITTEE

Senator KEFAUVER. Just one more question, Mr. Chairman.

You referred to a committee established in the Defense Department to decide which of the services would perfect the rocketry of the satellite and it was given to the Navy finally.

How long did that committee consider the matter before it rendered a decision?

Dr. HAGEN. I cannot tell you precisely, but it was on the order of 2 months.

Senator KEFAUVER. Wasn't it longer than that? Didn't it have one chairman who withdrew, then another chairman who—

Dr. HAGEN. Well, I was not a part of the whole of the proceedings of that committee, so I do not believe that I am in a position to tell you exactly. I believe that the length of time that committee was considering the problem was on the order of 2 months but I do not know that in detail.

Senator KEFAUVER. Was it the committee of which Mr. Quarles was finally the Chairman?

Dr. HAGEN. No, sir, this was the Committee on Special Capabilities which reported to Mr. Quarles at that time.

Senator KEFAUVER. Was there another committee in addition to that one?

Dr. HAGEN. I am sure there were other committees within the Department. I think, I am not sure, though, of which committee you are referring to.

Senator KEAVER. I was referring, sir, to the committee to make a decision not to give the rocketry to the Army or to the Air Force but to the Navy.

Dr. HAGEN. The Committee on Special Capabilities does not in this sense decide, they recommend. And this recommendation was made to the Department of Defense, and as I recall it at that time, the man who sat in the position to which the recommendation would be made was Mr. Quarles. And the Department of Defense made the decision, based on the recommendation of the Committee on Special Capabilities.

Senator KEFAUVER. All right, thank you, Doctor.

Senator JOHNSON. Is that all the questions you have, Senator Kefauver?

Senator KEFAUVER. Yes.

Senator JOHNSON. Thank you very much, Senator.

Senator Flanders, any questions?

SATELLITE GUIDANCE

SENATOR FLANDERS. Sir, I had to go out once or twice and I did not get the significance of this December 3 device which you have on your desk.

Is it expected to put that in more or less self-sustaining orbit?

Dr. HAGEN. Yes, sir.

It will be on a test vehicle, and if that vehicle functions properly this will go in a self-sustaining orbit.

Senator FLANDERS. The orbit will be approximately of as long a life as you would expect from a later device?

Dr. HAGEN. Not quite as long. Because the area mass ratio is different, it might not last as long. However, there is an interesting thing about this which I did not point out before, and that is that these things up here are solar cells so if this stays in an orbit for several months it will continue to radiate all that while.

Senator FLANDERS. That device is not provided for the larger one?

Dr. HAGEN. At the present writing, it is not.

Senator FLANDERS. Yes.

Now, you have been speaking about guidance. I take it that for the satellite the guidance is in the vertical plane, primarily?

Dr. HAGEN. I laid emphasis on the vertical plane because that is the critical thing.

As a matter of fact, however, there is guidance along all three axes, in roll, pitch, and yaw. If you made a mark with a piece of chalk on the vehicle on the ground before it was launched you can say that mark will be on top when it gets through its orbit.

Senator FLANDERS. Well, now, just for the fun of it, I carry my date book in my pocket which is a General Electric date book.

Dr. HAGEN. Yes, sir.

Senator FLANDERS. And I figured out what a degree means at a thousand miles.

I take it that at a thousand miles a minute gives 1,540 feet of error, and at 3,000 miles it gives pretty nearly a mile of error.

So 1/60th of a degree gets to be of importance in the intercontinental thing?

Dr. HAGEN. Yes, sir; that is correct. That is the arithmetic.

Senator FLANDERS. You mentioned—you used the word once in a while—the engine. Is this anything more than a simple rocket?

Is there any other mechanism involved?

Dr. HAGEN. No. Well, there are many other mechanisms in the rocket.

Senator FLANDERS. Yes. The propulsion?

Dr. HAGEN. The propulsion is a straightforward liquid rocket in the first two stages, and a solid propellant rocket in the third stage.

Senator FLANDERS. What is that little thing on the tail of rocket No. 1?

Dr. HAGEN. Oh, that is the nozzle of the engine, and you know this rocket had no fins.

Senator FLANDERS. Yes.

Dr. HAGEN. This is one of the developments that came out of the Viking program.

We found we could steer the rocket by moving the engine back and forth much as you would balance a broom on your finger.

JUPITER VERSUS THOR

Senator FLANDERS. Yes.

Well, that is interesting.

Now was not Jupiter in the further stage of development than the rocket you are presently using and, if so, why didn't you use Jupiter?

Dr. HAGEN. To which Jupiter are you referring, sir?

Senator FLANDERS. Well, the only Jupiter I know of is the one that has supposedly had some fairly successful trials down at Canaveral.

Dr. HAGEN. Well, the reason I asked the question is because there is a Jupiter per se, and a Jupiter-C, and I wondered, are you thinking of the IRBM Jupiter?

Senator FLANDERS. Yes.

Dr. HAGEN. The IRBM Jupiter, to the best of my knowledge, was not available in the summer of 1955 to the extent that one would have felt safe in using it for this purpose. We now know that if we should take either of the IRBM's, the Jupiter or the Thor, and put some of these Vanguard components on them, we could put much larger things in good orbits.

Senator FLANDERS. However, are you willing to say that there was no shift from your present Vanguard proposal to one of the IRBM's indicated, that no such shift would have improved the final launching of a successful missile?

Dr. HAGEN. It is touch and go. I think that this is almost correct, that you have to make certain assumptions about what kind of priorities you have to get the right to take these things when you want them. But assuming that, for the argument that you had all of the priority in the world, I think you just about break even.

Senator FLANDERS. Yes. Well, I felt that it was important to hear you say that.

Dr. HAGEN. Yes, sir.

Senator FLANDERS. Because that subject has been under considerable discussion.

Dr. HAGEN. Yes.

ELLIPTICAL VERSUS CIRCULAR

Senator FLANDERS. Just one other thing about the orbits.

Is it easier to get an elliptical orbit than it is to get a circular one?

Dr. HAGEN. Yes, sir. The circular orbit is just a special case of the elliptical.

Senator FLANDERS. I see.

Dr. HAGEN. If you hit everything exactly right you can make a circle.

Senator FLANDERS. But you really were stating your purpose when you said there were advantages to the elliptical orbit that did not inhere in the circular orbit?

Dr. HAGEN. That is quite correct; yes, sir.

Senator FLANDERS. And because of the apogee, you can get one set of observations and at the perigee the other?

I am trying to remember how I saw those two words spelled in that press release but they were funny. I am through, Mr. Chairman.

Senator JOHNSON. Thank you, Senator Flanders.

Senator Stennis?

REENTRY NOSE CONE

Senator STENNIS. Dr. Hagen, I wanted to ask you about this cone the President showed in his address on the television.

You will recall that he said it had been beyond the atmosphere, and had returned. Well, if you have personal knowledge of that, would you enlarge on it some and give us the significance of it?

Dr. HAGEN. Well, sir, I have very little personal knowledge of that, only what I—the only thing I can say is what I read in the newspapers, and my knowledge really is limited almost to that.

That was a nose cone out of a test for the reentry problem. It had been sent up on a missile and came back down into the atmosphere at some supersonic speed, and——

Senator STENNIS. Without being destroyed?

Dr. HAGEN. Without being burned up, yes.

Senator STENNIS. Well, was that in itself a sufficient demonstration there to establish this superproblem of reentry, as the witnesses described it yesterday?

Dr. HAGEN. I am not really—I think I am beginning to get to the point where I am not competent to discuss this, because I don't know the details.

SPUTNIK I AND II

Senator STENNIS. By the way, this sputnik that could be seen from the ground here Sunday evening in Washington——

Dr. HAGEN. Yes.

Senator STENNIS (continuing). Which one was that, and was that the cone or the rocket casing, or what?

Dr. HAGEN. That was the casing of the first Soviet satellite. It can only be seen in twilight, and of course it is seen for a while and then you wait a few weeks and it comes back again. This is the second or third appearance of that. But it was of the first satellite.

Senator STENNIS. May I ask you if you saw it?

Dr. HAGEN. Yes, sir. I saw it the night before last on the way home from work.

Senator STENNIS. Well, I claim the distinction of having seen it myself, and I am very much impressed.

Dr. HAGEN. It is a very thrilling thing to see.

Senator STENNIS. Distinctly not a star or a plane or anything of that kind.

Dr. HAGEN. Right.

Senator STENNIS. You say that this second sputnik, you expect it to stay up, did you say, several weeks or several months?

Dr. HAGEN. Oh, I think it probably would be months.

Senator STENNIS. Months?

Dr. HAGEN. Months, yes. I cannot say how many, but several.

Senator STENNIS. If you commented on the weight of this second sputnik, I did not hear it.

Dr. HAGEN. No, sir; I did not give it.

Senator STENNIS. Would you comment on that? This 1,108 pounds, do you think that it does weigh that much? And, if so, what is the significance of being able to launch one that heavy?

Dr. HAGEN. Yes; I think there is every evidence that it weighs that much, and that was what was back of the statement I made

that what they have done so far with the satellites has indicated that they have worked with vim and vigor on their ICBM problem. The launcher is of that type.

Senator STENNIS. And that is the main threat, is it not, from Sputnik II; that is, what Sputnik II demonstrates?

Dr. HAGEN. It certainly is; yes.

Senator STENNIS. With this launching power, then, it is very reasonable to assume a corresponding development over in this other field; is that correct, now?

Dr. HAGEN. That is quite correct. You cannot tell from the satellite effort how far along they are with the other or how far in their tests and guidance and all of that, but nevertheless they have demonstrated that at least in these tests they have the propulsion.

Senator STENNIS. The disturbing news came here a while ago during your testimony, and I did not know just how far you went in giving a military appraisal to this Sputnik II.

Did you say that you would desire closed hearings on it to give that testimony?

Dr. HAGEN. I would prefer to talk about that in a closed hearing; yes, sir.

Senator STENNIS. Very well.

That is all I have, Mr. Chairman. Thank you.

Senator JOHNSON. Thank you, Senator Stennis.

Senator CASE?

Senator Smith?

Senator SMITH. I have no questions, Mr. Chairman.

Senator JOHNSON. Senator Symington?

Senator CASE?

RECOVERY OF NOSE CONE

Senator CASE. Mr. Chairman.

Dr. Hagen, was it an accident that this cone was recovered which the President showed in his broadcast, or was it anticipated that it would be recovered?

Dr. HAGEN. It was no accident. It was designed to be recovered, and there were elaborate precautions made to actually recover it.

Senator CASE. Then the fact of its recovery was, it was a successful effort?

Dr. HAGEN. I think in every way, yes.

Senator CASE. Are you free to say whether or not it was recovered where and when it was expected that it might be recovered?

Dr. HAGEN. Well, only—again, I didn't take part in that experiment. I do not know the dates. But let me say that this thing that you saw that was recovered—I think I detect something—this was never a satellite.

Senator CASE. I understand that, but it did represent a certain achievement if something can be sent as far as that was and then recovered—

Dr. HAGEN. Yes.

Senator CASE (continuing). At a point where it might be expected to be recovered.

Dr. HAGEN. Yes.

Senator CASE. And recovered more or less intact.

Dr. HAGEN. That is correct. It was an Army experiment. The Navy, however, did participate in the recovery, and they did have ships in the right area at the right time to pick the thing up.

Senator CASE. Now, it is implicit in what you just said that it was recovered at sea.

Dr. HAGEN. Oh, I thought that this was generally known.

Senator CASE. Well, I was just bringing this out to sharpen the point that the recovery at sea required an anticipation of where it might be recovered, and how it might be recovered, and that that effort was successful.

Dr. HAGEN. Yes.

Senator CASE. I was down at Canaveral the other day, and heard some further information about it, but what you have just said wholly corresponds with that.

But I was impressed by what I heard there, and by what you have said here, that the fact of the recovery required certain planning, and that that involved anticipation as to timing and conditions and method, and that that was all successfully done.

Dr. HAGEN. Yes, this is true.

Senator CASE. Are you free to translate the thrust or the propulsion that sent Sputnik II, with the weight that it had, to the height that it achieved, into terms of an ICBM?

Dr. HAGEN. These are the kinds of numbers that I would prefer to talk about in a closed session, and not in an open one. I am sorry.

Senator CASE. Thank you very much.

That is all, Mr. Chairman.

Senator JOHNSON. Senator Bush?

Senator BUSH. I have no questions, Mr. Chairman.

Senator JOHNSON. Senator Barrett?

Senator BARRETT. No questions, Mr. Chairman.

Senator JOHNSON. Senator Carroll?

SENSE OF URGENCY

Senator CARROLL. Dr. Hagen, as I recall that part of your testimony, you said that you personally had had a sense of urgency—

Dr. HAGEN. Yes, sir.

Senator CARROLL (continuing): About this program.

Dr. HAGEN. Yes, sir.

Senator CARROLL. Were the scientists connected with the Navy in close contact with scientists of the other military establishments, the Army and Air Force, in this matter, because of this sense of urgency?

Dr. HAGEN. Not every one of them, of course, but where the need arose I think the answer is "Yes."

Senator CARROLL. Did I understand correctly that in May of this year, due to the development of the engine of the third rocket, you abandoned the nose cone concept to the sphere that you have indicated, the missile?

Dr. HAGEN. The test was in May, but the decision to do this, based on the derived information from the test, did not come until July.

Senator CARROLL. It was July, then, that certain decisions were made?

Dr. HAGEN. Yes, sir.

RAND REPORT

Senator CARROLL. It has been brought to my attention that there was a 24-page report submitted by the RAND Corp., of Santa Monica, Calif. It was a report made to the Air Corps, June 21.

Dr. HAGEN. Yes, sir.

Senator CARROLL. This fits into the general period between May and July.

In that 24-page report, it indicates that the Soviet publications, scientific publications, I assume, indicate that the Russians were about to send forth a satellite.

So this article—and I am reading from the Washington News of November 22, 1957—contained a sketch of a dog harnessed for space flight. Were you aware of that RAND report?

Dr. HAGEN. No, sir.

Senator CARROLL. Was that ever called to your attention, as you cooperated with scientists of the other military establishments?

Dr. HAGEN. I don't believe it was.

Senator CARROLL. Did you know that the Russians were about to launch, according to this report, or, if you heard about the report or from other sources, they were about to launch their project in the latter part of September?

Dr. HAGEN. No, sir; I think the answer to that is "No."

Senator CARROLL. That is all.

CONCLUSION

Senator JOHNSON. Thank you, Senator Carroll.

Are there any further questions of counsel?

Any additional questions of any Senator?

Doctor, would you tell this committee of anything which you think needs to be done now to place this Nation in a more secure standpoint in relation to the Soviet Union?

Dr. HAGEN. In the area in which I am now working, I think that certainly, as I indicated before, there should be an organization and plans made to go further in the area of space investigation and space flight.

Senator JOHNSON. You would say that the present organization and the existence of plans at the present time in the area in which you are working are inadequate?

Dr. HAGEN. At the present time, I think it is; yes.

Senator JOHNSON. If you had the complete authority and responsibility, what changes would you make?

Dr. HAGEN. I think what is needed, and the precise location of the organization, is perhaps debatable; but what is needed is a single organization devoted to this type of work. Whether that organization would be better placed in the Department of Defense or whether it is better a separate agency is the question to which I do not have the answer, but I know it would work within the Department of Defense. There should be, however, this single agency into which policy decisions should be passed, and then both the authority and the responsibility for action would be given to the agency.

Senator JOHNSON. And I assume the necessary funds to carry it out?

Dr. HAGEN. Yes, sir; that goes with the authority.

Senator JOHNSON. Do you have any recommendations that you think you should make to this committee that you have not already made?

Dr. HAGEN. I believe I have pretty much covered what I had in mind when I came; yes, sir.

Senator JOHNSON. Are you familiar with the testimony taken yesterday by this committee?

Dr. HAGEN. Not in detail. I heard a bit of the testimony of Dr. Bush. But I did not hear or read, so far, Dr. Teller's.

Senator JOHNSON. Do you have any comment to make on Dr. Bush's recommendations?

Dr. HAGEN. What I heard, I was entirely in agreement with.

Senator JOHNSON. Dr. Hagen, the charts to which you referred in your testimony will be made a part of the record.

Dr. HAGEN. Thank you.

(The charts referred to appear on following pages.)

Senator JOHNSON. Dr. Hagen, the committee thanks you very much for your—

Senator STENNIS. Mr. Chairman, may I say just one additional word?

Senator JOHNSON. Senator Stennis.

Senator STENNIS. Dr. Hagen, I want to commend you for the very clear statement you have made about this one responsible authority in charge of the program, one who had the responsibility and the authority to act in the premises.

I have asked others that question. I did not ask you, because I thought you might be a little too intimately connected with it to want to give a flat opinion, but I think you have given a very clear one and a very valuable one.

May I add this additional point there, and see if you do not also include this: You set up this person with authority to correlate and get all the program together and run it. If it is going to be overruled by, say, the Secretary of Defense or the Bureau of the Budget, he still does not have the authority to move.

Now, will he not also have to have the authority which is right next to the President himself, to be exercising the President's authority directly, to overcome any impediment of that kind from whatever source, Budget Bureau or wherever?

Dr. HAGEN. Yes, sir; that is correct. You get into an area where I guess it is the sin of being big.

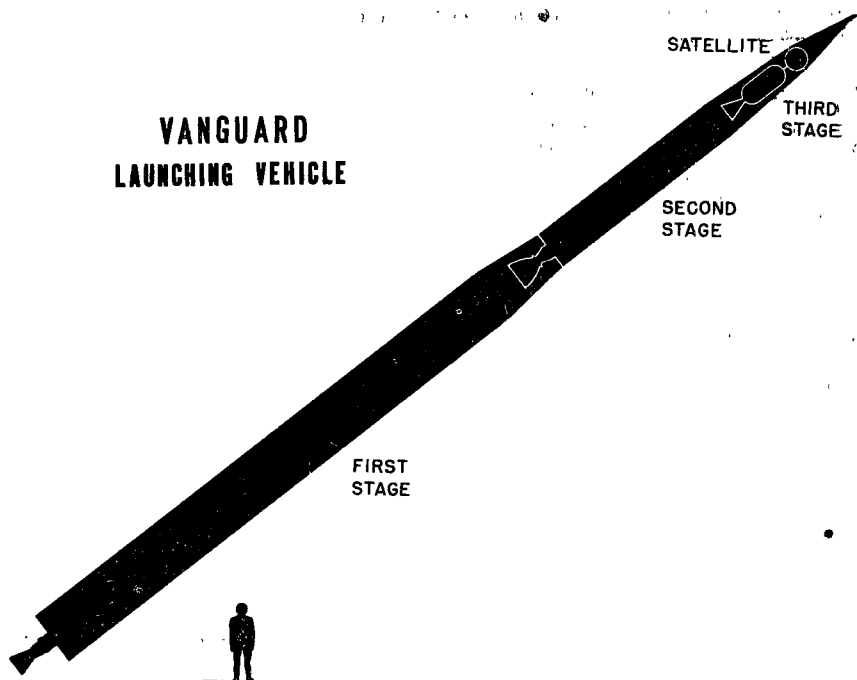

The clear delegation of authority does not always hold because of the simultaneous delegation of authority by the man above you to his staff, who can then second-guess on decisions.

Senator STENNIS. But my point was to have the real authority that would make the programming, under all circumstances, it would have to be Presidential authority that this man holds and exercises subject only to the President himself.

Dr. HAGEN. It would certainly help to have that weight behind it; yes, sir.

Senator STENNIS. Well, it is almost necessary; is it not?

Dr. HAGEN. That depends, again, on the statement of the authority, and the method of operation of, in this instance, the Department of Defense. I think it could be so stated that the man in the Department of Defense could proceed in an uninhibited fashion, but it would have to be made clear in the beginning that he did have this authority.

Senator STENNIS. And thereby would be, in effect, exercising or speaking for the President, as being superior in this field to the other departments, say for instance the Budget Bureau or the Department of Defense itself, if need be. He would have to be superior to them.

Dr. HAGEN. I do not like to say yes to that. I feel I am just a little bit out of my field when I start talking about——

Senator STENNIS. I appreciate very much the comment that you made, and you do feel the absolute necessity for this unified authority there with power to reach decisions and then to act?

Dr. HAGEN. I certainly do, if we intend to go anywhere in this area.

Senator STENNIS. Thank you very much, Doctor.

Senator JOHNSON. Does that conclude your questioning?

Senator STENNIS. Thank you very much, Mr. Chairman.

Senator JOHNSON. Dr. Hagen, the committee wants to thank you for your testimony. You have enlightened us on an extremely complicated subject, and I think all of us are much better able to understand it, after your explanation.

Dr. HAGEN. Thank you.

Senator JOHNSON. We hope now that you will go back to your work and speed up the important job that you have, and that you will receive the cooperation that is necessary in order to see that we make all the advances that are possible.

I think that every member of the committee has observed your dedication and your devotion, and we are grateful for the contribution you have made to us today.

Thank you very much.

The committee will hear the Director of Central Intelligence, Mr. Allen Dulles, in the Armed Services Committee Room, for the balance of the afternoon.

If we can conclude with his testimony, we will resume our meeting here in the Caucus Room tomorrow morning at 10 o'clock.

The committee will take a 10-minute recess, and then reconvene in the Armed Services Committee Room on the second floor.

The committee is now in recess.

(Whereupon, at 4:05 p. m., the committee recessed, to reconvene in executive session in room 212, Senate Office Building, at 4:15 p. m.)

INQUIRY INTO SATELLITE AND MISSILE PROGRAMS

WEDNESDAY, NOVEMBER 27, 1957

UNITED STATES SENATE,
PREPAREDNESS INVESTIGATING SUBCOMMITTEE
OF THE COMMITTEE ON ARMED SERVICES,
Washington, D. C.

The subcommittee met, pursuant to recess, at 2:20 p. m., in room 318, Senate Office Building, Senator Lyndon B. Johnson (chairman of the subcommittee) presiding.

Present: Senators Johnson (Texas), presiding, Kefauver, Stennis, Symington, Saltonstall, and Flanders.

Also present: Senators Byrd, Smith (Maine), Case (South Dakota), Bush, and Barrett, members of the Committee on Armed Services; Senator Cooper; Edwin L. Weisl, special counsel; Cyrus R. Vance, counsel; Gerald Siegel, associate counsel; Solis Horwitz, associate counsel; Daniel F. McGillicuddy, Jr., associate counsel; Stuart P. French, associate counsel; George Bunn, associate counsel; Edwin L. Weisl, Jr., associate counsel; Dr. William V. Houston, consultant; Dr. Homer Joe Stewart, consultant; and Dr. Edward C. Welsh, staff adviser.

Senator JOHNSON. The committee will come to order, please.

We plan to hear the Secretary of Defense, Mr. Neil H. McElroy, the Deputy Secretary of Defense, Mr. Quarles, and Mr. Holaday. If necessary, we will have an evening session in order to conclude with their testimony. As the testimony goes on, we can better determine how long we will be here this evening.

Our first witness is the Secretary of Defense, Mr. Neil McElroy.

Mr. McElroy, will you stand, please, and take the oath? Raise your right hand.

Do you solemnly swear the testimony you will give this committee will be the whole truth and nothing but the truth?

Secretary McELROY. I do.

Senator JOHNSON. Mr. McElroy, the subcommittee is fully aware that a tremendous burden has been placed upon your shoulders. We are also aware of the fact that it is a burden which you have assumed only recently.

We do not expect you to give us a long and exhaustive review of all the things that have happened in the past. In the event we must go over history, we would naturally turn to those who have the history at their fingertips, and who participated in making it.

You are here today to tell this committee as much as you can about your plans to meet this serious situation. During the course of our preliminary inquiries, it became apparent that you are one of the very few men in this whole picture who has the unquestioned right to make decisions. There are others who presumably have

that right, but the extent of their authority is in most cases still unclear, at least to this committee.

All of us are very much aware of the tremendous obligations that go with such a right.

Mr. Secretary, it is a pleasure to have you with us today.

Counsel may proceed with the examination. Mr. Wiesel.

TESTIMONY OF HON. NEIL HOSLER McELROY, SECRETARY OF DEFENSE

Mr. WEISL. Mr. Secretary, have you any statement that you wish to read to this committee?

Secretary McELROY. I do have a statement, Mr. Chairman and members of the committee, and counsel, that I would like to make at this point, if I may.

Mr. Quarles and Mr. Holaday and I are, of course, very glad to be with you and to make ourselves available for any questions you may want to ask of us.

However, before you begin your questioning, I have a brief statement to make which will, I believe, report an action which the Defense Department is taking today and which will be of considerable interest to this committee.

REASSESSMENT OF PROGRAM

We have been undertaking, during the past few days, an intensive reassessment of our position with respect to the testing and development program of our IRBM missiles, the Thor and the Jupiter. We have been greatly encouraged by the success that has been achieved in the recent tests of both of these missiles.

It is now clear that while neither of the missiles can be regarded as having completed its development phase, they both are at a point at which we believe we can, on the basis of judgment, make a sound decision to program additional production for operational purposes.

Accordingly, we are today authorizing the placing into production of both the Jupiter and the Thor missiles. By making use of the production capacity now available for both the Jupiter and the Thor, an operational capability can be achieved by the end of 1958 in the United Kingdom; and, as soon as necessary arrangements can be effected, at other appropriate locations.

The Department of the Army has assured the Air Force, which has the operational responsibility for the deployment of the land-based IRBM, of its full support in training of personnel and in other ways in which it might assist in making these weapons operational at the earliest practicable date.

In reaching these conclusions, we have benefited by the advice of Dr. James R. Killian, recently appointed Special Assistant to the President for Science and Technology.

While we cannot at this time define just what new appropriation and other authorization by the Congress will be required, we expect to submit any needed proposals to this end soon after Congress meets in January.

We believe, however, that we will not have extended our commitments beyond a manageable point before Congress may have had an opportunity to indicate its decisions in these matters.

Mr. Chairman and members of the committee, that is the report of the action that I wanted to put before you, and inasmuch as we were able to come to this conclusion late last evening, we felt that it would be appropriate to bring a report of that decision to this committee at this time.

I would like also to say that we considered making a report of greater length on some of the things that we felt might simply give historical background, particularly of a recent nature, with respect to actions that have been taken by the Department of Defense to move along, to speed up the missile program. We decided that it would take up unnecessarily the time of your committee, that most of these things would already have been reported to you, that if they had not already been reported to you they probably would be brought out in the questioning, so we have no other statement to make at this time, and are available for questions as you please.

Senator JOHNSON. Mr. Secretary, I want to make this observation before counsel proceeds with the questioning.

The statement you have made just now to the committee, and to the country, is good news. I hope, as this committee continues its investigation, there will be more reassessments, followed by more good news.

Will you proceed, Counsel?

Mr. WEISL. Mr. Secretary, in your statement you allege that you have been greatly encouraged by the success that has been achieved in the recent tests of both these missiles, referring to the Thor and the Jupiter missiles.

We read in the morning papers that the test of the Jupiter last night was a failure. Can you perhaps give us some light on the relationship of that failure to the report of success in your statement?

Secretary McELROY. I was conscious of that in writing this particular statement, Mr. Weisl.

I would say, of course, that the firing of a missile which was not successful in relationship to what was expected of it could not be regarded as favorable.

The reference that I made to our encouragement had not to do with a specific firing, but had to do with a succession of firings which, in their progression, did test various aspects of each of the two missiles.

This assessment I am talking about is an assessment that has been made by our scientific advisers. We believe it to be correct.

REASONS FOR PRODUCTION

However, the very fact that, in the case of a Jupiter last evening, there was an unsuccessful firing is one of the reasons why we are proceeding at this time with both missiles instead of with one only.

We feel that it is not right—we think it would be a wrong decision—inasmuch as you do not have a thoroughly proved missile as between the two, to move in any direction except on the two together.

Mr. WEISL. In your statement you also informed the committee that you are authorizing, as you have just said, the production of both the Thor and the Jupiter missile.

Now, the Jupiter missile is being developed by the Army; is that not true?

Secretary McELROY. That is correct.

Mr. WEISL. In view of the assignment of roles and missions to the Army, will the Army ever have occasion to use the Jupiter?

Secretary McELROY. Well, as I have said in my statement, Mr. Weisl, the role and mission is and has been assigned to the Air Force, which has the operational responsibility for the deployment of the land-based IRBM.

That decision was made some time ago, and is fully accepted by the Army as well as by the Air Force.

Mr. WEISL. In other words, the Army will have no control over the operation of the Jupiter when it becomes operational, and will not have any use for it in the performance of its roles or missions.

Secretary McELROY. The Air Force will handle the operation of the Jupiter as well as the Thor.

Mr. WEISL. Do you believe, Mr. Secretary, that it is a wise use of brainpower and manpower to have the Army develop a missile that it will have no use for in the performance of its duty in case of war?

RELATION BETWEEN PRODUCTION AND OPERATION

Secretary McELROY. I think in this case that this development of this missile, which has been very ably done by the Army, could be done for another service. I would say that there needs to be a close working relationship between the producing service and the operating service, if they are two different services.

We feel that will be done in the case of the Air Force taking over the Jupiter missile for operation.

Mr. WEISL. In your opinion, Mr. Secretary, would it not be better for the Army to use its brainpower and manpower to work on missiles and other implements of war that it will use in case of war, rather than to work on and implement missiles that the Air Force or some other branch of the service will use?

Secretary McELROY. My judgment, in response to that question, would be that we should use the facilities that are available in the various services for any of the important needs that we have.

The Army was asked to proceed in one direction, and this was with one group of scientists, toward the attempt to get an operational IRBM. The Air Force was asked to undertake the same assignment moving in another direction.

It was regarded as of sufficient importance that we not find ourselves having traveled a blind path by going in only one direction to develop an IRBM; that we should travel two different directions.

To me, it did not make a tremendous difference whether you followed those 2 avenues under 1 service or under 2 services. It is all the Defense Department. And it seems to me a perfectly normal thing to use the best-qualified people you have, whichever the service, in order to get the optimum in terms of performance for this country.

Mr. WEISL. Yes, sir.

REDSTONE MISSILE

Is the Army developing a Redland missile?

Secretary McELROY. Redstone.

Mr. WEISL. I mean the Redstone missile, I am sorry.

Secretary McELROY. The Army has a Redstone missile. The Army is very much interested in developing an improved Redstone missile, and a project is under consideration at the present time between the Army and the Department of Defense looking toward the authorization of the work, research and development work, and ultimate operability of an improvement on the Redstone.

Mr. WEISL. Will the Redstone missile have a range of 500 miles?

Secretary McELROY. I do not know what the range will be. The range will be whatever seems to be required under the conclusion of the Joint Chiefs of Staff for the Army mission.

The Redstone up to this time has been approximately in the range of 175 miles.

Mr. WEISL. Under the assignment by the Defense Department to the Army of its roles and missions is it not limited to 200 miles?

Secretary McELROY. I believe that is correct.

Mr. WEISL. So that if the Redstone missile has a range of 500 miles, it, too, would not be used by the Army.

Secretary McELROY. I think there could be a change in the roles and missions at that point.

Mr. WEISL. I see.

Do you believe there should be a change in the assignment of roles and missions to the Army?

Secretary McELROY. I would like to put it in these terms: The military advisers to the Department of Defense are the Joint Chiefs of Staff, and I would be quite favorable to putting that question before the Joint Chiefs.

Mr. WEISL. I see.

Mr. Secretary, in what respect does the Thor missile differ from the Jupiter missile?

Secretary McELROY. I will have to pass that one. I think perhaps I could refer that one to Mr. Quarles if you would like to have a better informed man tell you.

Mr. WEISL. The reason I asked that question, Mr. Secretary, is that in the course of our limited investigation, we were advised by some informed people in the military service there that there was practically no difference between the Thor and the Jupiter. That they represent a duplication of effort, and that perhaps one or the other should have been made in order to save time, to save manpower, and to save scientific organization.

Secretary McELROY. May I ask if it would be all right for me to refer it to Mr. Holaday or Mr. Quarles because they are better able to answer that?

Mr. WEISL. All right, sir.

Senator JOHNSON. If counsel will permit I suggest that either you ask Mr. Quarles when he is the witness, or, if counsel prefers, he can ask him now.

Do you want to ask Mr. Quarles now?

Mr. WEISL. Whatever the committee desires. I think it would be better perhaps to examine the witnesses separately on that subject, but if the committee desires we might ask the question now to save time.

Counsel certainly has no objection.

Senator JOHNSON. I would suggest you proceed with the examination of Secretary McElroy. Mr. Quarles will be with us the rest of the day.

Mr. WEISL. Mr. Secretary, have you had the opportunity to make a study of our missile program since taking office?

Secretary McELROY. I had the good fortune to be advised by my predecessor to travel around the country some before taking office. And in the course of that I was directed toward a number of our manufacturing plants and installations, both of an aircraft and of a missile character, so that I had the privilege of visiting the Western Development Command where the Air Force is undertaking its development of the ICBM's and of the Thor IRBM, and I also spent some time in Huntsville where I visited and could become acquainted with the people who were responsible for the development of the Jupiter.

I have great confidence in both, I might say.

It was most impressive to me, having come from industry into the Defense Department area, to find the quality of people who are working in both of these important arsenals.

Mr. WEISL. As a result of your studies and investigations, have you come to any conclusion or conclusions with respect to our missile program?

Secretary McELROY. I don't believe I understand exactly what that is pertinent to.

I reached some conclusions like the one we have reported here today.

Mr. WEISL. Well, perhaps I could be more specific.

Have you reached the conclusion that in the missile program we were behind or ahead of the Russians?

I might, in order not to appear as trying to lay the foundation for something else, I might say that in your press conference of November 15, 1957, you stated "We are behind the Russians in missile and satellite developments."

Secretary McELROY. Let me speak to that point.

The question that had been asked of me there led me to give this unequivocal answer since it referred at least as I interpreted it, to a combination of a missile and a satellite.

It seems to me it was quite obvious that we were behind the Russians in that respect because there were already Russian satellites in the air, and we did not have any in the air.

POSITION RELATIVE TO RUSSIA

It is not as clear to me that we are behind the Russians in the overall missile development. As I am sure your committee has found and knows very well, there is a great multiplicity of missiles in our arsenal that are operable.

We are, however, I believe at the present time in this country primarily concerned with the longer range ballistic missiles, and I take it to a considerable extent the question that is being asked is being asked with respect to the two programs of the IRBM and the ICBM.

Mr. WEISL. Let me try to be more specific, Mr. Secretary.

Are we ahead or behind the Russians in the development of the intercontinental ballistic missile?

Secretary McELROY. I don't believe we have positive knowledge as to whether we are behind, and I am quite sure we don't have positive knowledge as to whether we are ahead.

I really have no positive view on that. I would certainly proceed, however, in our programs on the basis that we must accelerate our programs in order to stay ahead, if we are ahead, and to get ahead if we are not ahead.

Mr. WEISL. Have you any basis for believing that we are ahead in that field?

Secretary McELROY. I have no basis for believing that we are ahead.

Mr. WEISL. Have you any basis whatever for believing that we are behind in that field?

Secretary McELROY. On a relative time basis, I do not have any such information.

Mr. WEISL. Well, let me put it another way, sir: When the Russians launched a satellite weighing half a ton, did they have to have an instrument in the nature of an intercontinental ballistic missile to put in orbit an object of that weight.

Secretary McELROY. I am told that in order to put in or build an instrument of the weight of the most recent satellite they needed to have a rocket with sufficient thrust that it would have provided adequate thrust for an intercontinental missile.

However, I am also informed that there are many other things that are required in addition simply to rockets of that thrust before you have an operable ICBM, and it is in those other areas that I do not have the information, I do not believe it is available to any of us.

Mr. WEISL. What other things do we have to know besides the fact that they have a rocket engine that has sufficient thrust to catapult a half-ton satellite in orbit?

Secretary McELROY. Well, here again, I can simply tell you what I have been informed, and not through thorough understanding of this.

It does seem to be evident that you must have a returnable nose cone.

If it burns up on the way back in through the atmosphere to hit its target, then of course it can become an ineffective weapon.

Another thing that the weapon must have is some reasonable guidance system.

So that even though it does have a nose cone that will let it come back and hit the ground, it needs to hit the ground somewhere near where you are trying to smash an objective.

All of this becomes pretty delicate in its instrumentation, because once you put one of these tremendous instruments up in the air and get the ICBM on orbit, it is there and it will go wherever it is to be told to go at that point, and of course its tremendous speed and tremendous distance means that it needs to have very, very great exactness.

So that I do not think we can assume that they have an ICBM from the fact that they are able simply to provide rockets of tremendous thrust.

Mr. WEISL. Mr. Secretary, do we have a rocket engine with sufficient thrust to place a half-ton satellite in orbit?

Secretary McELROY. I am told that the answer to that is that we don't have a single rocket engine but that we would use multiple rocket engines which would be adequate to do what you are suggesting.

POSSIBILITY OF SATELLITE LAUNCHING

Mr. WEISL. So that in your opinion, by the use of multiple rocket engines, we could launch a satellite weighing a half ton?

Secretary McELROY. In my judgment.

Mr. WEISL. In orbit? We might or we could?

Secretary McELROY. In my judgment we could if we had the other knowledge required to put a satellite in orbit, and I think we must prove that by some of the test satellite firings which are scheduled for December and up through March.

Mr. WEISL. In addition to having a rocket engine or a series of rocket engines of sufficient thrust, we must have propulsion of sufficient power to launch such a satellite in orbit?

Secretary McELROY. Yes. Are you talking about fuel?

Mr. WEISL. I am talking about fuel. Do you believe that we have that type of fuel?

Secretary McELROY. I believe from what I am told that with our fuel as it now is available to us, and with the rocket engines that we have available to us, and using them in multiple form, that we can do what you have asked in terms of putting a half-ton satellite up into the outer atmosphere.

Mr. WEISL. While we do not need as accurate a guidance to place a satellite in orbit as we do to hit a precise target with a missile, yet there is some guidance required to place a satellite precisely in orbit, is there not, Mr. Secretary?

Secretary McELROY. Yes.

Mr. WEISL. And the Russians certainly have that much guidance?

Secretary McELROY. Oh, yes. I don't want to underestimate, Mr. Counsel, nor to the committee, the importance of the technical capacity that has been demonstrated by the Russians having placed these two satellites in orbit, which they have done.

Mr. WEISL. I do not want to belabor the point, Mr. Secretary, but I think you will agree that it is safe or safer for this country to assume that the Russians have or will soon have an intercontinental ballistic missile with proper guidance and that they have a solution of the reentry problem.

Don't you think that is a safe course for us to pursue?

Secretary McELROY. That would be the way I would prefer to run the Defense Department on the assumption that we should be prepared for just such a situation.

INTERMEDIATE MISSILES

Mr. WEISL. Now in the field of intermediate missiles, that is to say missiles with a range of up to 1,500 miles, where do we stand?

Secretary McELROY. We stand about where my statement as read to the committee when we began indicated that we stand.

We feel that in the case of both of the Thor and the Jupiter that we have had sufficient encouragement that we can expect to have production models of the Jupiter and of the Thor delivered and put on site with crews that can handle them for firing by the end of 1958, which is just about a year from now.

Mr. WEISL. When you speak of models or types, do you mean by the end of 1958 we will be in production of a sufficient number of

the Thors or the Jupiters or both actually to put them in operation with trained crews.

Secretary McELROY. Yes; I am talking about the first squadron which would be put into the United Kingdom under the agreement worked out with the British some time ago.

I think it was at Bermuda, at the Bermuda conference.

Mr. WEISL. What does a squadron consist of, Mr. Secretary?

Secretary McELROY. A squadron—

Mr. WEISL. Is that a security problem?

Secretary McELROY. Yes.

Mr. WEISL. Would you say that in respect to—

Secretary McELROY. I am a little naive about these things.

Mr. WEISL. Sir?

Secretary McELROY. I am a little naive about this—this is the first time I have been at a public hearing.

Mr. WEISL. So am I. You and I are in the same boat and I hope you will correct me or stop me at any time if I enter into classified or security areas.

It sometimes is difficult to distinguish them because sometimes what the military tell me are secrets, appear in the newspapers or magazines the next day.

Secretary McELROY. It is also true with me.

Mr. WEISL. I am sure. [Laughter.]

Would you say we are ahead or behind the Russians in the field of the intermediate missiles or IRBM's, as they are commonly called?

Secretary McELROY. I have some feeling that we could answer this question a good deal more frankly if we could—if we did not have an open hearing.

Mr. WEISL. Very well, sir.

On October 18, Mr. Secretary, you had a memorandum prepared directing the three services to pinpoint problems concerning the development of missiles, of ballistic missiles.

What was the result of the memorandum?

Did you get any reports?

Secretary McELROY. Yes.

Mr. WEISL. What were the reports?

Secretary McELROY. Weekly reports that I get from Mr. Holaday report on the progress made on the testing during the previous week, and indicate where, if anywhere, any easing up in the rules on such things as overtime might be helpful in accelerating the program.

The principal thing I can say to you is that I do have the weekly reports. Each time that I receive them, Mr. Holaday and I discuss them. He indicates where action may be helpful, and in some cases I have been able to take care of it.

In fact, I think in every case with which I am familiar, I have done so.

BOTTLENECKS IN PROGRAM

Mr. WEISL. Can you without breaching security, tell the committee what bottlenecks you found and what remedies you took to eliminate them?

Secretary McELROY. Well, the principal bottleneck that we felt we found early was the limitation on overtime in certain instances.

Where that was discovered we moved rather quickly in order to authorize overtime since the services indicated that any such freedom from restriction would help them in speeding up of their programs.

Mr. WEISL. Mr. Secretary, in the course of our short study, we were advised that in August of this year a telegram was sent to all manufacturers of missiles that no requests for overtime would be honored.

Are you aware of such a telegram?

That was not sent during your period as Secretary.

Secretary McELROY. I am not familiar with the order being distributed by telegram nor am I familiar with it having been distributed at exactly that time.

Mr. WEISL. If such a telegram were sent, Mr. Secretary, or any other information or notification given to manufacturers, will you be good enough to supply it to the committee?

(The request telegram is as follows:)

In response to the request for a copy of a telegram or other communication sent to manufacturers of missiles in August 1957 prohibiting overtime, there follows the relevant text of a specimen of such a communication addressed to the Douglas Aircraft Co., Inc., attention: F. W. Conant, senior vice president, Santa Monica, Calif., subject: "Elimination of Overtime, WS-315A program," dated August 23, 1957, and signed by H. M. Zinn, Air Force administrative contracting officer at Douglas Aircraft Co., Inc., Santa Monica, Calif.

"Effective September 2, 1957, the administrative contracting officer is limited to approve overtime on all work under subject program other than that relating to the test effort to a maximum of 3 percent, and this amount only upon a showing of justification that such overtime is needed to resolve emergencies and critical bottlenecks. It is not intended that the flight and static test program be impeded, and if necessary and justification therefor is established, the administrative contracting officer may approve additional overtime to support such flight and static test, and engineering effort in support thereof, to an overall maximum of 6 percent of total programed man-hours. In other words; in the event that a maximum of 3 percent is justified and used for work other than in support of the test program, then an additional 3 percent of total programed man-hours may be approved by the administrative contracting officer for support of the test program; and whatever lesser amount than 3 percent of "other" work is justified and used may be added to the allowance in support of the test program up to an overall maximum of 6 percent of total programed man-hours.

"In the event that overtime in excess of that specified above is required, the approval of the Ballistic Missiles Office must be obtained and the procedures set forth in reference B must be complied with.

"If in your opinion you will require overtime during September and subsequent months in excess of that specified above it is suggested that your application therefore be submitted immediately so that a decision by the Ballistic Missiles Office may be made prior to September 2, 1957."

Secretary McELROY. Yes, of course.

Mr. WEISL. Now, in your memorandum you stated that all requests for overtime since you took office, have been approved.

Secretary McELROY. You mean for relief from overtime restrictions?

Mr. WEISL. Yes, from relief or relief from overtime restrictions.

Secretary McELROY. Relief from overtime restrictions.

LETTING OF CONTRACTS

Mr. WEISL. Mr. Secretary, may I ask you whether you have made a study of the letting of contracts to manufacturers?

What I mean is this: As we understand the system, when an order is given to a manufacturer to produce a product such as a missile or

some component part of a missile, there is no incentive given to him to deliver that missile earlier or to make it better.

He receives a cost-plus fixed fee for his services.

If he does bad work, he gets the fee. If he does good work he gets the same fee. If he delivers the product ahead of time he gets no reward. If he delivers the product after he agrees to deliver it, he gets no penalty.

Have you made a study of that entire subject?

Secretary McELROY. I have not made a study of that subject since I have been in office.

I am sympathetic to the question that you raise. I have discussed this with my associates because it has been necessary for me to understand contracting procedures.

I am told that even though organizations such as the Hoover Committee and others who have reviewed practices of the Defense Department have commented somewhat as you have, nevertheless there has been no way found up to this time for operating new and untried weapons like the development of a new missile on the basis that you would suggest which would provide incentive both for improvement and for earlier delivery and for what I would hope would be lower costs.

Mr. WEISL. In order to make clear, and I think I have made it clear, what I am getting at and what the committee wants to get at let me say this:

If our system of free enterprise is right, and we believe it is, it is based on an incentive proposition.

In other words, people to do good work, to make better products, to make them quicker, are given an incentive.

Now in our investigation of the letting out of contracts for missiles and for other defense or military products, we find that incentive provisions are completely absent.

In other words, a supplier has no incentive to deliver goods quickly, to make them better.

He is just as well off and sometimes better off to take his own sweet time and deliver them later, and I think the committee would like you, Mr. Secretary, to make a study of that entire subject or delegate someone to make a study of that subject, to see if we cannot do in defense what business does privately and give people an incentive to get things done quicker and penalize them if they do not get things done quicker.

Secretary McELROY. I will be glad to undertake such a study. I think it should be understood, however, that there are contracts that do provide incentives. They are in the types of procurement which are more standard items.

(The secretary's study on incentives and penalties is as follows:)

Following are illustrations of how incentives and "penalties" are provided within the contracting and administrative authority under which the Department of Defense operates.

As indicated during the hearings, contracts are awarded on a firm fixed-price basis whenever possible. This provides the greatest incentive to a contractor to perform his contract as rapidly and inexpensively as he can. If costs are less than originally estimated, the fixed contract price paid to the contractor leaves him with a larger profit than originally estimated.

It is not usually feasible to enter into a firm fixed-price contract which involves the simultaneous development and production of complicated technical equipment. By and large, such contracts would be inequitable for both the Government

and the contractor, since neither costs nor completion dates can be predicted with acceptable accuracy in advance. As a result, any fixed price to which a contractor would agree would be inflated by sums estimated to meet the contingencies involved in such novel work. However, in contracts for such equipment, clauses are used establishing a target price and providing for redetermination of that price at certain times during the performance of the contract. It is Department of Defense policy to pay a higher profit to those contractors who will assume a greater degree of risk by agreeing to redetermine prices at an early point in contract performance.

In another widely used contract form, the fixed-price incentive contract, a formula is established by negotiation, whereby the price will fluctuate with experienced costs. If the final cost exceeds the target cost, the price is adjusted so that the contractor's profit will be less than if the final costs equal the target. Such contracts provide for ceilings upon upward revision of the price. On the other hand, if the final costs are less than the target, the price is so redetermined as to provide a higher rate of profit to the contractor than if he had merely met the target cost.

Cost reimbursement type contracts, the final category of defense contracts, are performed with the least amount of risk on the part of the contractors. In these contracts there is still an incentive to perform faster and cheaper, because if a contractor exceeds the estimate of costs, his fee is normally not increased, and thus his rate of profit is reduced.

A cost reimbursement type contract is considered only when it is for the procurement of items of such nature and complexity that costs of performance cannot be estimated with reasonable accuracy. Generally, it is used in research and development work where scope and nature of the work cannot be definitely specified; where the supplies are not items regularly manufactured or the services called for have not been previously performed, or partial experience will not reveal a proper pricing level for the remainder of the production; or where specifications are not complete and major changes substantially affecting the scope of the work are expected.

A variation of the cost reimbursement type contract is a cost-plus-incentive-fee contract in which the amount of the contractor's fee will, to some extent, depend on whether he has equaled or run above or below the estimated cost.

In addition to contractor profit incentive inherent in the type of contract used, there are other incentives and penalties which the Department may use in a variety of contractual situations. Some of these are discussed below.

Generally, defense contracts make no provision for increased compensation to the contractor if he performs a contract in a shorter time than provided by the delivery schedule. However, such provisions have been placed in contracts. Recent illustrations are the Snark and B-58 contracts of the Air Force in which a formula was agreed upon providing for an additional fee if the contract delivery schedule was accelerated.

In both negotiated and formally advertised contracts, incentives may be provided to prospective contractors which are not readily apparent in the contract terms. For example, procurement agencies may indicate a desired delivery schedule and inform the bidders that other delivery schedules may be acceptable but that the contracting officer will give great weight in evaluating bids to proposed delivery schedules which are faster than the desired schedule. In such instances, contracts have been awarded to the bidder who has offered a delivery schedule which is most advantageous to the Government. Such contracts will normally contain a corresponding penalty provision providing for reduction of the price in case the agreed delivery schedule is not met.

In some contracts it has been possible to provide for allowance of increased profit if specifications are exceeded. This type of incentive is more or less limited to first development contracts, involving testing for configuration and performance characteristics. This feature has been included in recent contracts for the B-58, F-106 and the Snark missile.

Finally, major manufacturers are aware of the fact that continued procurement of a weapon may well depend upon how satisfactorily early contracts are performed. Thus, the hope for continued Government business is probably one of the prime incentives.

Turning now to some of the "penalty" provisions inherent in defense contracts, in routine production contracts, contractors who either fail to perform in time or who are so dilatory as to endanger performance of the contract are subject to termination for default. Contractors submitting items which do not conform to specifications are subject to penalties contained in the inspection and default clauses inserted in all contracts. This may result in the contractor's having to

replace the item or rework in place, or acceptance of the nonspecification item by the Government at a reduced price.

Liquidated damages clauses are authorized for insertion in contracts. Such clauses may be used where time is of the essence and whenever the contracting department deems such a clause to be necessary for the protection of the Government.

Additionally, contractors who have poor performance records may be denied contracts upon the basis that they are not considered to be responsible bidders under procurement regulations. Contractors who are guilty of a willful failure to perform defense contracts or who have a history of serious failure to perform, or of unsatisfactory performance, in accordance with the terms of one or more contracts, may be debarred from doing business with the Department of Defense for a specified period of time which, under governmentwide regulations, is generally about 3 years.

Secretary McELROY. The real problem has been to find any set of criteria under which you could make incentive payments to people who are working on development contracts such as the IRBM contracts.

But we will certainly take your suggestion, Mr. Weisl, and we will be very glad to work on it because I am confident that in that area as well as many others in which we work, there is definite improvement possible.

Mr. WEISL. Mr. Secretary, we have been advised and perhaps erroneously, but we have been advised that it is illegal to give a supplier a bonus for good work or better work; is that true?

Secretary McELROY. I don't—the word "bonus" I am not clear on.

Mr. WEISL. Well, a bonus means something extra.

Secretary McELROY. Yes.

Mr. WEISL. Some inducement. We have also been told where something extra is given to a supplier of war goods, that on renegotiation that bonus or that extra payment, if it has been made, is immediately cut out.

Secretary McELROY. Well, I have heard those statements and I think there may be some justification in them; but the fact that the renegotiation would take them out does not get away from the fact that there is an attempt made to provide an incentive in those areas where you can set up the criteria.

The operation of the renegotiation act is something which is always discussed pro and con when it comes up.

I don't know what I can say about that one because it usually is determined by someone other than the administrative side of Government.

Mr. WEISL. Mr. Secretary, this committee feels very strongly that where time is of the essence and where our country is in such a critical condition, we ought to bend every effort to give every supplier an incentive to do better work and quicker work so that we get these weapons on time or ahead of schedule.

Secretary McELROY. I think it is a sound observation.

Mr. WEISL. I believe you are sympathetic to that viewpoint?

Secretary McELROY. Absolutely.

Mr. WEISL. And the committee would very much appreciate it if you would study that matter and at your earliest convenience report what has been done in that respect.

(See Secretary's study, p. 203.)

Secretary McELROY. All right.

RESTORES RESEARCH REDUCTION

Mr. WEISL. On October 28, Mr. Secretary, you rescinded an order of your predecessor and restored \$170 million that the Congress appropriated for research and development; is that right?

Secretary McELROY. I rescinded an order which reduced research and development by 10 percent and it was commonly construed as restoring against a million—a billion—

Mr. WEISL. \$170 million, Mr. Secretary?

Secretary McELROY. Against a billion, seven, of research and development total.

Mr. WEISL. Well, \$170 million may not sound like a great deal as compared to a billion, seven hundred million, but some distinguished scientists as Dr. Teller and Dr. Bush testified that in research five or ten million dollars may mean the difference between a good development and no development at all. At any rate, you felt that and we compliment you that you decided to restore this cut.

Secretary McELROY. Well, thank you. We felt that it was in order. I don't say this in any necessary disagreement with my predecessor.

Mr. WEISL. I understand that.

Secretary McELROY. He made his decision on what he felt were fully justifiable grounds, and we made the other decision on what we thought were fully justifiable grounds.

Mr. WEISL. Well, I make the point because people often say that Congress did not give the Defense Department enough money for research.

Well, here is a case where Congress did give the Department money for research and the Department cut the appropriation by \$170 million and you were wise enough and good enough to restore that cut.

Secretary McELROY. I think I should say to you, and that was the reason for my hesitation, that the \$170 million is not research expenditure in the sense in which I believe Dr. Teller would refer to research.

Mr. WEISL. Well, what division of research and development is that cut restored to?

Do you mean—

Secretary McELROY. Part of it was research in the sense that he thinks of research and development. I mean thinks of research—

Mr. WEISL. Are you distinguishing between basic research and applied research?

Secretary McELROY. That is right.

Mr. WEISL. And this was mostly for applied research?

Secretary McELROY. A substantial portion of it was applied research but a considerable amount—and we wanted that to be freed up also—was to restore the basic research contracts which we had mostly with universities.

Mr. WEISL. Thank you.

JUPITER-C AUTHORIZED

On November 8, Mr. Secretary; you authorized the Army to use the Jupiter-C missile to launch a satellite; is that correct?

Secretary McELROY. I don't know about the date but I did authorize that that be done.

Mr. WEISL. And this order of yours reversed an order that was made in the middle of 1955; is that correct?

Secretary McELROY. Well, I am not conscious of its reversing one but it supplemented one.

Mr. WEISL. It supplemented one.

Now, why did you feel that it was necessary, Mr. Secretary, and I am not asking, please don't believe that I ask any of these questions critically. It is merely my effort to get at the facts.

Secretary McELROY. I want to answer quite honestly.

It was my belief at that time in consultation with my associates that there was some doubt, not major but some doubt as to the success that would be attendant upon the launching of a satellite by the selected method, the Navy Vanguard method.

We felt that there had been some evidence that our major competitor in the world was able to do this.

We felt that in the general interest of this country, both nationally and internationally, that we should make certain that we would be able to launch satellites for our International Geophysical Year commitment which went through the year 1958.

So we authorized this additional program as it was announced as a supplement to the Vanguard program simply as a kind of insurance which we felt at that time was desirable to provide.

Mr. WEISL. Yes, sir. Mr. Secretary, Dr. Hagen, in charge of the Vanguard satellite program, testified here yesterday that he had requested top priority for his program and that had he been given top priority he could have launched a satellite ahead of the Russians.

We have examined men from the Jupiter program who told us that they advised the Defense Department that they could have launched a satellite 6 months or a year ago.

PRIORITY REQUEST

Can you give us any information from your study of the satellite and missile programs, first, why Dr. Hagen's request for priority was refused?

Secretary McELROY. I am told by my associates that the request that was reported by Dr. Hagen was not received by the Defense Department.

Mr. WEISL. It was not received? Would it have gone to the Defense Department or would it have gone to some other department?

Secretary McELROY. Well, I would have thought it would have gone to the Defense Department.

Mr. WEISL. So that the Defense Department—

Secretary McELROY. There seems to be some difference here in recollection and understanding. I don't mean to suggest at all that Dr. Hagen would have said something that he did not believe to be exactly as he said it, because Dr. Hagen is a thoroughly fine man.

Mr. WEISL. Yes, sir.

Secretary McELROY. I think there is some difference of recollection.

Mr. WEISL. The Vanguard project, however, was under the Defense Department, was it not?

Secretary McELROY. Yes. It is under the Navy.

Mr. WEISL. So that, if such a request were made, it would have to go to someone in the Defense Department?

Secretary McELROY. Yes; I would have thought so.

Mr. WEISL. Is the organization of the Defense Department so complex that a request of such importance could be made without anyone in the Defense Department knowing anything about it?

Secretary McELROY. I should not think so.

Mr. WEISL. Could it have been lost in the mails?

Secretary McELROY. I doubt it. No.

Mr. WEISL. Could it have gone to the Navy?

Secretary McELROY. Oh, it could have gone to the Navy.

Mr. WEISL. And, if the Navy received it, would it have had to go to someone in the Defense Department for decision, or could the Navy have made that decision independently of anyone in the Defense Department?

Secretary McELROY. I don't know whether this may help at all to clear this up, but I am told that Dr. Hagen reported to this committee that the project had never been given high priority, but there is no understanding on the part of our people, from his testimony, that he said he had requested that it be given high priority.

Mr. WEISL. Oh, no. He positively stated under oath here that he requested high priority and that the request went, first, to the Navy research department, and then he said he understood it went to some committee or some advisory committee. He did not know, however. But he positively stated he made that request.

Secretary McELROY. I think that the only thing I can do is to give you a report after I investigate, because I have no knowledge.

Mr. WEISL. Thank you, sir.

Secretary McELROY. Would you like me to do that?

Mr. WEISL. Mr. Chairman, would you like him to report on that?

Senator JOHNSON. I would certainly like for you to supply all of the information you have in your possession or that you may be able to obtain concerning whether or not the request was made and, if so, to whom it was made and what decision was made in connection therewith. For your information, I should like to read, very briefly, Dr. Hagen's statement so you may have full information on what you may be requested to supply.

Secretary McELROY. Yes, sir.

(The Department of Defense report on Priorities—Vanguard is as follows:)

PRIORITIES—VANGUARD

All military procurement is rated "DO" under the Office of Defense Mobilization-Business and Defense Services Administration industrial priority system. The symbol "DX" is a higher rating and takes precedence over "DO" rated orders, if necessary, to meet required delivery dates. It should be noted that the "DX" rating, prior to January 1957, was utilized by BDSA only on a case-by-case basis to meet specific bottlenecks. In January of 1957, DOD was authorized by ODM to use "DX" rating on a program basis, i. e., to rate all contracts and orders for a program designated as of highest national importance.

As contrasted with the "DO" and "DX" ratings, the master urgency list is part of the system used internally within DOD to identify relative priority of segments of its procurement program. The system provides for four categories of urgency, "S" and categories 1, 2, and 3. "S" items, and those items in category 1 which need special attention, are listed on the master urgency list in descending order.

It can generally be said that a "DX" program rating is part of the industrial priority system, indicating the highest national priority, and an "S" urgency

assignment is part of a DOD system of relative urgencies assigned to guide DOD expediting and special assistance actions in cases of conflict between competing military programs.

The following is a chronology of the priority actions taken with respect to the Vanguard program:

1. On April 2, 1956, the Navy requested that Project Vanguard be included in category "S" of the DOD master urgency list. Prior to this time, no request had been made to place Project Vanguard in any position on the master urgency list.
2. On May 29, 1956, the Department of Defense approved the inclusion of Project Vanguard as item No. 1 in category 1. In this position, Vanguard was outranked by only relatively few urgent military items assigned to category "S," including ICBM and IRBM, and it took precedence over all other items of military equipment, including missiles such as Nike. The priority assigned to Vanguard served to expedite requests for special assistance in cases where production difficulties required application of higher ratings or issuance of directives to break specific bottlenecks.
3. On December 19, 1956, the Navy advised that the assigned priority of category 1, item No. 1, appeared adequate at the time, but that it might become necessary to request a category "S" priority as the program entered the critical testing stage.
4. In view of the urgency which the Vanguard project assumed in October 1957, the Navy Department requested on October 30 that the project be placed in the "S" category and that the Navy Department be authorized to issue "DX" ratings. On November 7, the DOD placed Vanguard in category "S."
5. Concurrently, the DOD requested the Director of ODM and the Administrator of BDSA to authorize the use of the "DX" industrial priority rating for Project Vanguard. Upon receipt of these approvals, the DOD delegated "DX" rating authority for all procurement for the Vanguard program on November 7, 1957.

Senator JOHNSON. Dr. Hagen in his testimony yesterday stated as follows, and I quote:

Dr. HAGEN. Early in the project, (I think I explained earlier that those of us in the project have always had a sense of urgency about this thing) we did request top priority or high priority for the project so that we could get along at the maximum possible speed.

Mr. VANCE. When did you make that request?

Dr. HAGEN. I cannot give you the exact month, but it was some time late in 1955 or early in 1956.

Mr. VANCE. To whom did you make the request?

Dr. HAGEN. Well, in the organization in which we work, our requests go through the office of Naval Research and from there they go on up through the Navy Department to the Department of Defense.

Mr. VANCE. Was your request granted?

Dr. HAGEN. No, it was not, in the form in which we asked it.

Mr. VANCE. Do you know who made the decision not to grant it?

Dr. HAGEN. I do not know.

Mr. VANCE. Did you subsequently make any recommendations with respect to speeding up your launching schedule?

Dr. HAGEN. Yes, we did.

If you will recall, I said that the flight of this third stage was extremely successful, and at that time, we saw an opportunity to advance the date when we could possibly put an object in an orbit, and the way we could do that within the program as it then stood, was to change the later vehicles and put the small satellite on them.

I think it is obvious, in answer to a question that I think Senator Johnson was after earlier, that had this project in the beginning been conceived of as a top priority project, then certainly we would have gone ahead faster than we did under the limitations under which we worked.

Mr. VANCE. That was your recommendation?

Dr. HAGEN. Yes.

Secretary McELROY. Well, suppose I take that as the testimony, and see what we can find to comment on, and we will file such a paper with the committee. (See p. 208.)

Senator JOHNSON. Thank you, Mr. Secretary.

Mr. WEISL. Mr. Secretary—and again I say please don't think that anyone is criticizing you, we are just trying to get at the facts in the best way we can—do you not believe that where a project as important as the launching of a satellite is involved, someone in the Defense Department ought to know how a request for top priority is disposed of?

Secretary McELROY. Well, this is the only thing I can say, and this is speculatively: These requests, a request of the type that you are talking about, would have to go through some hands, and the determination of moving it on to the point of where a decision could be made of such importance as this would be a decision that could be made at each level.

I do not know whether this was passed on or not, but I intend to report to you.

But it could always happen that somebody along the line would not pass it on, and if Dr. Hagen, or the man who was really quite interested in it, did not press to see that it did happen, it might get stuck along the way.

Mr. WEISL. I do not know what Dr. Hagen could have done beyond making the request; and if it happened to Dr. Hagen, it could happen to others in the missile program, and if such a thing does happen to others in the missile program, it might very seriously delay and affect our entire program.

And it may be true that this complexity of organization that we have been told exists in the Department of Defense, has got to be streamlined to a point where the right hand will know what the left hand is doing, so to speak.

Secretary McELROY. I would like to comment on that point.

Certainly we would prefer to have a Defense Department that was about 5 percent as big as it is. I think it is almost impossible to expect to have as simple an organization to handle an operation of the size of this tremendous defense effort, as it would be to have a small business kind of operation.

I think that I could say, though, from my own examination of this missile program—which, of course, because of my having put my neck out a country mile and taking it onto myself, I have had to do that—I do not find that the kind of thing you are talking about has contributed in any important way to a slowdown in the development of the missiles.

There has been, because missiles have a high priority, a very quick line to the point of decision. This is particularly true since Mr. Holaday's assumption of office, but I believe it was true even before that.

Mr. WEISL. Yes, sir.

Senator JOHNSON. Mr. Counsel, I think I should point out, in fairness to the Secretary, that the testimony which goes on at pages 359 to 360 indicates that a second request was initiated by Dr. Hagen; that that request was initiated after Dr. Holaday had been named as special assistant; and that Dr. Holaday received that request directly on the 15th of July of this year; and that he investigated the recommendation and soon agreed that it was a wise move, and immediately proceeded.

Secretary McELROY. I see. We will make that part of our record. Thank you, sir.

DR. KILLIAN'S APPOINTMENT

Mr. WEISL. Mr. Secretary, on November 7, the President announced the appointment of Dr. Killian as his assistant in connection with scientific and technological developments in matters in the defense of our country.

In that same statement or speech, he said that Dr. Killian would provide himself with a staff of competent scientific and technical advisers; that he was authorizing the appointment of Mr. Holaday as a special assistant in charge of the guided-missile program with full power, the same power as the Secretary of Defense had in that program.

First of all, may I ask you, Mr. Secretary, if you know what power Dr. Killian has?

Secretary McELROY. Well, I know what power Dr. Killian believes that he has [laughter], and this is by the statement of the President, so I think that this is—

Mr. WEISL. What is the power that you believe that he has?

Secretary McELROY. His power is to serve as a scientific adviser to the President. Inasmuch as a great amount of the application of science in Government is concerned with the defense effort, he would work closely with the defense effort in order to be in a position to advise the President about the scientific applications in defense.

I do not believe that it was intended at any point for Dr. Killian to come into the Defense Department for order giving, and I do not believe that he thinks so.

Mr. WEISL. Yes, sir.

Well, have you worked out some *modus operandi* so that you and the President's adviser, Dr. Killian, cooperate and work together on the speedup or the acceleration of the missile program?

Secretary McELROY. We think that we have. We start from the fact that both Mr. Quarles and I, and I believe also Mr. Holaday—but I speak with positiveness about Mr. Quarles and myself—have known Dr. Killian for many years; and since we have the kind of advance knowledge of him and his working, we consider that his coming into this picture is of nothing but complete advantage to the entire effort, regardless of where he puts his time.

He has been at the Defense Department, for example, this morning for several hours, working with us on certain high-priority programs.

He has been doing that in order that he may advise the President with respect to them in the way that I think the President has hoped that Dr. Killian would serve as a scientific adviser.

I think we have a very good relationship started, and we intend to keep it going that way, because we think he can be of very great help to us as well as to the President.

Mr. WEISL. However, he has no power.

Secretary McELROY. I would say his power is advisory, but with his strength of position with the President, and the President having unquestioned power, he also has very considerable power by just kind of rubbing off.

KILLIAN DOES NOT HIRE PEOPLE IN DEPARTMENT OF DEFENSE

Mr. WEISL. But he has no direct power to hire anyone or fire anyone, to raise anyone's salary?

Secretary McELROY. He has a staff, but he does not have direct power to hire people in the Defense Department.

Mr. WEISL. What staff has he?

Secretary McELROY. I would rather be relieved of that one, because I have not really gone into that in detail with Dr. Killian. I know he is going to have some staff.

Mr. WEISL. Well, the staff that he has advises him?

Secretary McELROY. Works with him, helps him.

Mr. WEISL. Works with him. And then he, in turn, advises the President.

Secretary McELROY. Yes, sir; that is my understanding.

Mr. WEISL. Then he carries that advice over to you.

Secretary McELROY. Well, that is right. Principally, I would say that he not only advises us, but he becomes familiar with what we are doing, or propose to do, in such ways that he can advise the President with respect to those programs.

Mr. WEISL. Mr. Secretary, Dr. Killian is a very distinguished scientist, and an experienced man in administration, and he has worked in Government and headed commissions before.

Back in 1955, he made a thorough investigation of the missile and satellite program, and made certain recommendations.

Without going into those recommendations—we will have to go into them in closed session—do you of your own knowledge know whether those recommendations were followed?

Secretary McELROY. I do not know. I do not know specifically about those recommendations, except in quite general terms, so I would prefer not to comment in response to that.

Mr. WEISL. Now, pursuant to the President's directive, you appointed Mr. Holaday as Director of Guided Missiles, and in that directive you stated:

The Director of Guided Missiles will direct all activities in the Department of Defense relating to research, development, engineering, production, and procurement of guided missiles.

Does that mean that he has authority only in the Department of Defense, or does he have authority in the various branches such as the Army, the Navy, and the Air Corps, in connection with guided missiles?

Secretary McELROY. He has the authority of the Secretary of Defense, to whom he is an assistant, in the various services as well as in the Office of Defense.

Mr. WEISL. In our effort to find out just what his authority is, Mr. Secretary, we examined the press conference that you held in that connection.

Secretary McELROY. I remember I was pressed considerably on this point.

Mr. WEISL. And in that press conference, when you were questioned about what Mr. Holaday's new powers and responsibilities were, you stated, and I quote:

He is not an operating executive who directs individuals who are working on any of these missile programs. That is done in the services themselves.

Now, how can a man be a director of the guided missiles program when he has no authority to direct the individuals who are working on any of these missile programs and when that work is done in the services themselves? Now, just how does that work?

Secretary McELROY. Well, it is a very good question. [Laughter.]

The answer must stem from the fact that we concluded—at least this was a separate conclusion of mine which I take it was a followup on a conclusion reached by my predecessor—that any change in the operation of the missile program at this particular stage would have really dangerous possibilities of slowing down the entire effort.

So that instead of there being any belief that we could actually make a gain by pulling all of them together under one actual directing director in the sense that I think you were reaching for, that—

Mr. WEISL. I am not reaching for it. That is what the public, I think, and the committee have been led to believe that Mr. Holaday is.

HOLADAY'S AUTHORITY ENLARGED

Secretary McELROY. I think that I made clear in my statements just what Mr. Holaday was not expected to do as well as what he was expected to do. We did not think that there should be any change in the actual operation by the services of their respective missile programs, for the reason that I have given.

We felt it would actually have a dangerous possibility of slowing down the entire effort at a time when we could not, in this country, afford to slow down.

So what we felt we should do was to extend the authority of Mr. Holaday, which up to that time had been restricted to certain types of missiles, so that it would cover the entire missile field.

That was done in this directive.

And the other thing was to give him, through the addition of the title of Director of Guided Missiles, an added authority of the title to supply his coordinating authority with direction.

It is not an order-placing, it is not an order-canceling kind of direction. It is a coordinating direction.

Mr. WEISL. Now, Mr. Secretary, our Commander in Chief told the people as follows on November 7 of this year:

I have directed that the Secretary make certain that the guided-missile Director is clothed with all the authority that the Secretary himself possesses in this field, so that no administrative or interservice block can occur, and to work intimately with this official.

Now, I think a reasonable construction of that direction by the President of the United States is that Mr. Holaday is the boss, and he is going to direct the missile program and have power and responsibility over everyone connected with it, and can direct the Army, the Navy, or the Air Force, after hearing their story, and that he would be the boss. At least that is my poor—perhaps I am dumb in believing that that is what was meant, but that is the way I interpret that language.

Secretary McELROY. We interpreted it in the way in which we took action.

Mr. WEISL. But, if he has no authority over the men in the Army, Navy, and Air Force who are managing and developing these guided missiles, he is nothing again but an adviser.

Secretary McELROY. I think the men in the Army, Navy, and Air Force know that he has authority.

Mr. WEISL. They may know it, but, unless he has the power to enforce that authority, what good is their knowledge of it?

Secretary McELROY. He has the power of the Secretary of Defense, to whom he is an assistant.

Mr. WEISL. But you said in your interview, Mr. McElroy, that he does not have that power.

Secretary McELROY. I think, if you will read it, that you will find that I did say so, because that was my entire point; that the strength of the assistant to the Secretary, who is also the Director of Guided Missiles, is derived from his position as assistant to the Secretary of Defense.

Mr. WEISL. But you say he is not an operating executive?

Secretary McELROY. That is correct.

Mr. WEISL. How can a man have power without being an operating executive? I may not understand the language properly. Maybe I am not a good enough or experienced businessman. Maybe I am just a poor country lawyer, but it seems to me that a man with power must be an operating executive. He certainly is not the head of a debating society.

Secretary McELROY. There is no question but what if the Secretary, if I were operating the program myself, that I would operate it in the same way that Mr. Holaday is operating. I would operate through the services.

Mr. WEISL. I do not say I—but it seems to me that, of course, you have got to operate through the services, but somebody has got to be the boss, and if a fellow is a director of a program, he has got to be the boss of that program, unless you overrule something that he wants to do, and that was what the President, I think, meant when he said that he will be clothed with the same power that you have, and you certainly have the power to tell the Air Force and the Navy and the Army what to do in guided missiles. In other words, you do not leave the discretion to them, I hope, entirely.

Secretary McELROY. No.

HOLADAY RECOMMENDED MANUFACTURE OF BOTH

Mr. WEISL. Your statement which you made to us today indicates that you have decided or someone decided that the Thor and the Jupiter programs were to go ahead separately. Did Mr. Holaday decide that?

Secretary McELROY. It was on Mr. Holaday's recommendation.

Mr. WEISL. Who decides which project goes to which service? For instance, suppose there is a new missile that someone suggests, and it looks like a reasonable one to put into operation. Does Mr. Holaday have the power to decide which service that missile goes to and which service develops it or who develops it?

Secretary McELROY. What customarily happens is that the service goes to Mr. Holaday to propose this missile, and Mr. Holaday will then recommend to the Secretary of Defense.

Mr. WEISL. Then what happens?

Secretary McELROY. The Secretary of Defense discusses it with Mr. Holaday, who then, in all probability, refers this to the Joint Chiefs of Staff for their determination of whether there is a need for this missile, a military need, and the Joint Chiefs of Staff—

Mr. WEISL. Then what happens after the Joint Chiefs of Staff consider it?

Secretary McELROY. Then there is a question of the financing of it. If the Joint Chiefs of Staff say that this is needed, if the project is to be financed, the approval then can be given, provided the financing is available in appropriations already made.

Mr. WEISL. Who gives that approval?

Secretary McELROY. Who gives the approval?

Mr. WEISL. Yes, sir.

Secretary McELROY. To proceed?

Mr. WEISL. Yes, sir.

Secretary McELROY. The Secretary of Defense.

Mr. WEISL. Does it have to go to the National Security Council?

Secretary McELROY. It would depend on the importance of the change.

Mr. WEISL. How important must it be before it goes to the National Security Council?

Secretary McELROY. If we have any doubt about it, we would send it there.

Mr. WEISL. And if you had no doubt about it, you would not have to send it there?

Secretary McELROY. Correct.

Mr. WEISL. Are there any committees working under Mr. Holaday?

Secretary McELROY. Yes, there is a Ballistic Missiles Advisory Committee.

Mr. WEISL. Who is on that Committee?

Secretary McELROY. I do not have all of the names. I am sure that we can get them for you.

Mr. WEISL. Are they people from within the Department, or are they outside of it?

Secretary McELROY. They are practically all from outside.

Mr. WEISL. And the name of that Committee is the Ballistic Committee, the Ballistic Missiles Committee?

Secretary McELROY. I have lost a word in there. The Ballistic Missiles Advisory Committee is the one I am talking about. It is outside people.

Mr. WEISL. And what happens? What powers or duties do they have or what do they do?

Secretary McELROY. They advise.

Mr. WEISL. Whom?

Secretary McELROY. Mr. Holaday. They are people highly qualified, technically.

Mr. WEISL. Are they qualified to pass on missile programs?

Secretary McELROY. They are qualified to advise Mr. Holaday on missile programs.

Mr. WEISL. I know that, but are they people experienced in that field? What are they? Are they scientists or professors?

Secretary McELROY. Professors mostly.

Mr. WEISL. And they advise Mr. Holaday what to do about a particular missile?

Secretary McELROY. Yes.

POWER OF THE COMPTROLLER

Mr. WEISL. Can the comptroller of the Defense Department overrule Mr. Holaday's recommendations on the ground that funds are not available for a particular missile program?

Secretary McELROY. Certainly if there is no money to finance a program, then there will either have to be some action taken that can be done internally, that sometimes is possible—

Mr. WEISL. What power has the comptroller got in the Defense Department?

Secretary McELROY. The power the comptroller has is to say whether there is any financing available for a program as proposed by anyone of the services or by the Department of Defense itself.

Mr. WEISL. He has a pool of money or an appropriation of money available for general projects. Does he decide whether that pool of money or any part of it should be allocated to any particular project or not?

Secretary McELROY. If you are talking about a reserve fund—

Mr. WEISL. Yes.

Secretary McELROY. There is a reserve fund to the Secretary of Defense. There is a research and development fund under discretionary authority of the Secretary of Defense. He has no authority to dispense that money. That money, if it is to be assigned, would be done by the Secretary of Defense.

Mr. WEISL. To cut it short, Mr. Secretary, do you have complete power over the Comptroller of the Department of Defense? Can you direct him what to do with the money that he has in any fund?

Secretary McELROY. So long as he has the money.

Mr. WEISL. So long as he has the money, you can direct him?

Secretary McELROY. That is correct.

Mr. WEISL. Does the atomic airplane come within the classified or secret phase of the Defense Department?

Secretary McELROY. If you ask very much about it, it does.

Mr. WEISL. Sir?

Secretary McELROY. What you have said so far does not but almost anything else you say will.

Mr. WEISL. I did not hear what you said.

Secretary McELROY. I said what you said so far would not but almost anything else would.

Mr. WEISL. Any delving into that?

Secretary McELROY. Yes, I think that would be quite sensitive.

Mr. WEISL. I must confess, Mr. Secretary, perhaps due to my obtuseness, that I still do not know what power Mr. Holaday has.

Secretary McELROY. That is the reason I said when you asked it, it was a very good question. I personally believe that Mr. Holaday does not feel deficient in authority. I think that he has what is needed to be an effective executive in the missile field, but I also would admit that my explanation of it of necessity leaves something to be desired for those people who simply listen to what I say.

Mr. WEISL. I would feel, Mr. Secretary, that if the chairman of this committee authorized me to conduct an investigation of the preparedness program, that he would not tell me that I could not question witnesses without his consent, that I could not go into this department or that department without somebody's consent, that I had to have some power to examine and question witnesses without his consent.

Anyway, I will not belabor the point any further.

Senator JOHNSON. Counsel, could I interrupt there to ask this question.

Mr. Secretary, do you consider yourself the real missile director?

Secretary McELROY. No, I do not. I consider Mr. Holaday the missile director. I consider that I am easily accessible to him when he needs the power that I happen to possess. Also, I have undertaken to review this program once a week to be certain that anything that I may contribute to Mr. Holaday can be certain to be there for him.

Senator JOHNSON. Mr. Holaday has the right to suggest, to recommend. You have the power of decision, is that correct?

Secretary McELROY. That is correct, and he sees me with regularity. I think he probably in the last few weeks, as you would guess, has seen me more consistently and steadier than anyone else in the Defense Department, with the exception of Mr. Quarles.

Senator JOHNSON. This looks like a new version of the old game, "Missile, missile, who has got the missile."

It seems to me that Dr. Killian has been selected to advise and suggest and counsel with the President, but he is clothed with no authority to make or enforce the decisions or to issue or place into effect orders or commands. It seems to me that Mr. Holaday is in somewhat the same situation. He is clothed by you with authority to coordinate and to keep in touch and to make recommendations, to get information and perhaps to act as a reporter; but the actual decision itself, the real missile program direction, the real power, the authority to get the job done, to say yes or no, right or wrong, do or do not, is with the Secretary of Defense.

Is that an unfair interpretation?

Secretary McELROY. I think you have to say that. It falls right in place, what you have said, from the position that Mr. Holaday has as assistant to the Secretary of Defense.

Senator JOHNSON. Then it is fair for the public to assume that while we have some window dressing, and while it might be necessary and desirable that all of us have counsel and advice and coordination under us, that Dr. Killian and Mr. Holaday are, in effect, counselors and advisors, but the operating heads, the decisionmakers, are the Secretary of Defense and the President of the United States?

KILLIAN'S CONNECTION WITH DEPARTMENTS IS ADVISORY

Secretary McELROY. Let me say that in my judgment, Mr. Chairman, that would apply a good deal more to Dr. Killian than it would to Mr. Holaday. We think of Mr. Holaday as having a good deal more authority in terms of working out a final program in the various missile fields, that he and the operating departments can then present to the Secretary of Defense, or that he himself can present to the Secretary of Defense; whereas I would judge that Dr. Killian—I do not like to be in the position of saying what he is to do, but nevertheless this is my understanding—actually is simply a man who understands and advises the President. And at the same time because of the very force of his standing in the country, would be listened to, but only advisory, by the departments with whom he is talking for the purpose of getting information to inform the President.

Senator JOHNSON. Thank you, counsel.

Mr. WEISL. Mr. Secretary, on November 15 I believe you announced the creation of a post for a manager of antimissile and military space-project developments. Have you made that appointment?

Secretary McELROY. No; we have not made the appointment. I wish that I had had time to settle into that one and do it because we would like to do it as quickly as we can. But the recruitment has not yet been accomplished. We want a very good man for the job.

Mr. WEISL. What is the purpose of that post?

Secretary McELROY. The purpose is an immediate one: to pull under a single manager—this is the first time this has been done in the Defense Department—actual operating units for the research and development work that goes on in the antimissile missile field and in the satellite and space applications field.

Mr. WEISL. What power will that manager or director have?

Secretary McELROY. He would have complete responsibility.

Mr. WEISL. In the same way that Mr. Holaday has it?

Secretary McELROY. We have a different point of view on this man. We feel that these programs have not gone so far but that we can pull them together without any slowing down of the development of those programs under a single director, a single manager. We think that there is sufficient complexity in both of these fields that the research and development assignment could very well be handled outside of the services as part of the Department of Defense, and then as you come close to the time when there may be an operation of this weapon, whatever it may be, it would be turned over to one of the services for it to deploy and use.

It is not thought that this agency would actually serve as a deploying agency.

Mr. WEISL. Do you not think, Mr. Secretary, and I am merely exploring, Mr. Secretary, you understand that, of course, do you not think that creating a post of a missile director on the one hand and then an antimissile director on the other hand might just add a little more complexity and more confusion? Why cannot the director of the missile program also be the director of the antimissile program?

Secretary McELROY. We considered that. We reached a conclusion, which we think is a right one, that the man who is head of the missile program in this country has got about as much on his shoulders as any one man should have. We think Mr. Holaday is loaded with as much responsibility as he should have in order to give stimulation and coordination to the missile program. For that reason, we felt that what we call advanced weapons—which is our term for that advanced-weapons agency, if that happens to turn out to be the term that we use—should not be put also upon Mr. Holaday, but that we should choose someone else who would then organize in a different way from the way Mr. Holaday operates to make his job effective and resultful.

Mr. WEISL. Would not the Army, the Navy, and the Air Force have their own antimissile missiles?

Secretary McELROY. They would not work on antimissiles under this concept. The work that they have done in the past would be pulled together and centralized within the single-manager agency that I am describing to you.

Mr. WEISL. Would that single manager have authority over the antimissile activities of the people in the Army and in the Air Force and in the Navy, or would it be, as you said, the same as Holaday who would not have that direct authority over those people? \

Secretary McELROY. He would have authority. Again it might very well be through the Secretary of Defense, but we have discussed this thoroughly with all of the departments of the Defense Department, all of the Army, the Navy, and the Air Force, and it is fully agreed when this agency that I am discussing takes form, it will take over all activities that any of the services are conducting in these areas. Up until then, in order not to lose any momentum, each of the agencies that has been working in these areas will continue their programs.

Mr. WEISL. This man will also be a director of the satellite program, the same man.

Secretary McELROY. He would have satellite applications?

Mr. WEISL. Is not the satellite very closely interrelated with the ballistic missile? Is not the satellite a projection, instead of projecting a warhead to a target, you project a satellite in orbit? Does not that really belong to the fellow that has got charge of missiles?

Secretary McELROY. Yes. The kind of satellite applications that we are talking about are not the type which are in the IGY. That would continue with Mr. Holaday, in our thinking.

We are talking about the highly technical missile applications which may go quite far, and again I think we had better talk on that later.

Mr. WEISL. That is what I am talking about. In other words, is not any kind of satellite another type of object that is being launched in orbit into outer space? In other words, instead of launching a warhead to a target, you launch a satellite in orbit into outer space.

Now, does that not belong to the fellow that has charge of missiles? I do not want to belabor the point.

Secretary McELROY. In our judgment, it did not. They do have in common the requirement that there be a thrust into outer space. That much they do have, but that is not the end of the road by any means on the antimissile missile, nor is it on the various satellite applications.

Mr. WEISL. Perhaps we can go further into that in closed session with Mr. Quarles.

Now, I also note that on November 19, you announced the creation of another office to direct development of nuclear power for planes and missiles.

What will that fellow have to do? What will his power and responsibility be? Maybe you were led into making some of these announcements before you got wise to this job.

Secretary McELROY. The advice I have is that that one should be kept for the closed session also.

Mr. WEISL. I hope, Mr. Secretary, that you will not consider any of these questions as in any way a criticism upon anything that you have done.

We are merely trying to explore this complex and difficult and sometimes ununderstandable organization to see if we cannot help speed up and accelerate this program which is so, so vital, where time is of the essence.

Secretary McELROY. I think all the questions have been——

Mr. WEISL. There is no criticism of you in any way, Mr. Secretary.

Secretary McELROY. I think all of the questions have been very reasonable, and I would like to compliment the entire committee proceedings so far that I have been able to follow through the press.

Mr. WEISL. Now, Mr. Secretary, just after Sputnik II was placed in orbit, you were quoted as having stated, and the statement was in *Aviation Daily*, which I am told is a very reputable magazine, on November 5, 1957, that "the launching of Sputnik II would not cause any change in the present United States rocket and satellite program."

I am sure you have changed your mind since if you did say it at that time.

Secretary McELROY. I think that was a simplified reporting of what I said. I think that what was said at that time and what was intended to be said was that this was not in itself an important change in the balance of military power between this country and the major opponent that we have.

Of course, the implications of it, looking down the road, do give us some apprehension.

Mr. WEISL. Mr. Secretary, may I go back to the directive that you issued on October 18, in which you ordered a three-service study of bottlenecks in the missile program, and may I go into specifics so that we do not overlap into the classified or the secret.

Was any report made to you about the complexity of the organization in the Defense Department standing in the way of speed and efficiency?

Secretary McELROY. No; I do not recall any such discussion.

Mr. WEISL. Do you have any views on that, or have you had time to formulate any?

ORGANIZATIONAL STRUCTURE OF PENTAGON UNDER SURVEY

Secretary McELROY. I would only say this to the committee, that we are planning to pay considerable attention to the organizational structure within the Defense Department in the hope that we will find ways in which there can be simplified handling of major problems.

However, I believe that this was an area which is of such really major importance that anyone coming into this position should take ample time to find out exactly what the workings are before thinking with others—I certainly would want advisors on this—toward any change.

The people that talk about the many channels that seem to be almost inevitably overlapping, I think, have the benefit of the argument when anybody looks at the Defense Department chart. I would hope that there might be some simplification. But I would not want to say that I have any real right to that judgment in the short time that I have been here.

Mr. WEISL. I am sure you are aware of what all of us have seen and what the public has seen; namely, this tremendous chart of bureau on top of bureau, committee on top of committee, office on top of office, and really, to the average unsophisticated or even sophisticated person, it looked like the most complicated jigsaw puzzle that ever was invented.

There certainly must be some way, and I am sure you can do it, Mr. Secretary—you are a man of great ability and experience in business—I am sure you would not tolerate that complexity in your business, there must be some way of streamlining this thing in an emergency such as we face, where time is of the essence and where

everything possible should be done to break down any bottlenecks that exist in a complex organization.

Secretary McELROY. I would certainly hope so, although I am somewhat restrained by the knowledge that I have had from very competent people who have preceded me in this job, and I feel confident they would also have worked in this same direction. Nevertheless, I might blunt my own lance, but I will have a try at it.

Mr. WEISL. The chairman thinks you had better make your own way and not rely too much on these so-called experienced people, because they have become traditionalists and they hate to change.

The chairman tells me, and I am sure what the chairman says is shared by the committee, that you are the kind of a fellow who will get action and who will simplify complex structures and get things done, and delegate power where power ought to be delegated, and when you delegate power, give the fellow that has got the power the authority to exercise it.

Now, then, another field in which we have been told there is a bottleneck is this timelag in making decisions when a request is made for a decision.

Dr. von Braun in Redstone says, "I have got to do this." He tells me that it takes forever, in his words, to get a decision.

Has any report been made to you about the need for speeding up the giving of decisions to people so that you do not have to go through these committees of scientists and these advisory boards and these other boards?

DEFENSE OF COMMITTEES

Secretary McELROY. I think that many of these boards that you refer to are for quite a good purpose. These are tremendous programs. There are tens and hundreds of millions of dollars involved in many of these decisions that some of our people would like to have made promptly. I can understand the desirability of a quick decision, but it needs to be a quick, informed decision.

Mr. WEISL. Yes; of course.

Secretary McELROY. And because of the tremendous size of these decisions, they often really should take some time.

Now, just a little decision, that seems so in the two pages I read here to you today, required many, many a lamp with the midnight oil burned just to come to that kind of a conclusion.

Mr. WEISL. I am sure of that, sir.

Secretary McELROY. And I am for speeding them up, but I do think that the people of this country also look to us, as they particularly do sometimes when the Russian is quite as gruff as he is at the moment, to be sure that the decisions we have taken have not been too hasty, and have been made with consideration of efficiency as well as rapid moving forward.

Mr. WEISL. That is right. You cannot always be perfectly right.

Secretary McELROY. I do not think you ever are.

Mr. WEISL. Sometimes you have got to make a judgment in time, because a good judgment made when it is too late is just as bad as a bad judgment made earlier.

Secretary McELROY. That is correct. We would prefer to have waited on this decision that I announced to you today if you had time. This was a decision that is going to cost the people somewhat more

than the decision would have cost if we had been able to go through the complete testing procedure before making an order for missiles. This is a decision that is made on judgment, and because it is made on judgment, it unfortunately needs to cost a little bit more money.

Mr. WEISL. Another criticism, Mr. Secretary, that has been made is in the field of research.

You have very properly and very encouragingly restored \$170 million to research, but we have been told that the trouble with research programs in Government is this: When there is an emergency, a lot of money is given to research. As soon as the emergency is slightly diluted, money is taken away from research. Scientists and engineers and technicians are let out.

Then, some little emergency arises and then there is a little speedup in research, and then when that emergency is diluted, again there is a cut.

In other words, there is a stop and go and an up and down in research, and the scientists tell me that that is the very worst thing that can happen to research, that if you want good research, you have got to keep it steady, you have got to get a flow of activity constantly going, and that you cannot turn it on and off like lights or water.

Are you sympathetic with that?

SYMPATHETIC WITH PROPOSALS FOR EVEN FUNDING

Secretary McELROY. Yes; I have heard the same thing, and I have heard it from some of my friends in the academic world. And I am prepared to believe it and I hope that the thing can be kept on a good deal more even keel.

Mr. WEISL. I do not think that is a thing that is peculiar to the academic world. I think that is really commonsense.

Secretary McELROY. It is commonsense.

Mr. WEISL. It has got to be kept up. You cannot turn it on and off.

Secretary McELROY. That is right. It is not limited to the academic field. It involves industrial research activity, also.

Mr. WEISL. Another area where we have been told in testimony that was adduced was that of interservice rivalry. We have been told that the services, and not dishonestly but very properly, argue for their position in a particular area, and that that rivalry is not coordinated, is not resolved quickly enough. It results in the same thing that one finds where there is a collective bargaining going on in a labor dispute: that the rivalries tend to slow up production, slow up results, slow up development.

Have you looked into that, Mr. Secretary?

Secretary McELROY. I have, because it has been involved very specifically in the missile area. I felt pleased with the attitude that was taken by the two services who are working together on this IRBM deployment.

One of the reasons I put the paragraph in this statement was to show that the Army—this was done with the kind of spontaneity which I think would have pleased all of you on the committee—offered its help, not only in training personnel, but in any other way in which it might be helpful in connection with the deployment of the Jupiter or of the Thor, as far as that is concerned, despite the fact that it was well known to the Army that the Air Force would be responsible for this deployment.

There is no use in my saying there is not a good deal of rivalry among the services. That would require my not reading the newspapers and not living in Washington. I have done a good deal of covering of this subject with Mr. Holaday and Mr. Quarles before reaching the conclusion that we should not get into any change in the management of our current missile programs. I do believe that there has not been a delay in the development of our IRBM's, the Thor, and the Jupiter, because of the working of interservice rivalry.

I think you could really make a case that the interservice rivalry has speeded up the development of the two, because, as you well know in our competitive economy, a competitive spirit, if it does not run amuck, does something to stimulate people to strive toward a result more than if they do not have that competitive spirit driving them.

The thing that is needed, in my judgment, is not to kill the desire to be better and to do the best job in their services that they can do, but to keep that from bumping into a competitive—not a competitive, a censorious—point of view toward other services. We are working toward this.

I am not depressed about our being able to work something out that will make this make sense, and one of the reasons for organizing this advance weapons agency is in order to help some of this; in other words, to take one of these new weapons in its incipency or near incipency and take it for research and development out of the services into the Department of Defense, and then not assign it for deployment until the research and development stage has been complete, or very nearly complete.

I think my answer is: I do not believe that the missile program is actually being hurt. I think it could almost be defended, and I would be willing to defend this argument that it has been helped in terms of speed by the fact that there has been rivalry among the services. And, second, I think that there are adverse aspects of rivalry which we hope to modify as we move along.

Mr. WEISL. I am sure, Mr. Secretary, that you believe that, and I am sure that if there is any harm from interservice rivalry, you will do your best and will correct it.

However, we have had testimony by men, like General Doolittle, who have said that interservice rivalry, of course, to a certain extent, was healthy.

All competition to a certain extent is healthy. But when that competition becomes so intense that the services, instead of fighting the enemy, are fighting each other, that is when the trouble results. And these people get so persuaded of their point of view and so hot under the collar about it that sometimes the wheels of progress are stopped while they are fighting each other's viewpoint. And you have got to be the fellow and you have got to have the right advice so that you can settle these rivalries quickly and forcefully, or give someone the power and authority to do so.

In that connection, Mr. Secretary, we had two types of testimony. One was by Dr. Bush. No doubt you are aware of it?

Secretary McELROY. Yes.

Mr. WEISL. He recommended a war planning board.

Secretary McELROY. Yes.

Mr. WEISL. A board that would consist of independent career people who would be attached to no particular service, but who would have the duty of formulating war plans and procurement plans for the Secretaries, so to speak.

Have you given any thought to that recommendation, or have you any views on it that you would like to express?

OPEN MIND ON PENTAGON REORGANIZATION

Secretary McELROY. I would not like to express views, because this is one of the suggestions that has been made as to how we might make more effective the working of the Department of Defense.

It certainly is one of the proposals that will be given consideration as we rather deliberately look at ways in which we might better organize the Department of Defense to give us what we are trying to buy.

I have heard rather convincing opinions to the contrary on that particular point, but I am not trying to render judgment at this time. And as far as I am concerned, my mind is quite open, because I also see virtues in what Dr. Bush has recommended.

Mr. WEISL. And General Doolittle, whom I am sure you know and respect, said that, based on his very wide experience in the military, and his service on various important commissions appointed by the President, what you need most is an advisory board in the nature of a general staff, consisting of young officers who are dedicated only to one thing, and that is the defense of the United States, and who would be your advisers, so that when the Joint Chiefs of Staff come to you with a decision or with an opinion, these men, who haven't any of the individual services at heart, but only the service as a whole at heart, could advise you without fear or favor, without prejudice in favor of any service, as to what your position ought to be.

He thinks that that would serve as great help to expedite the performance of your duty in this time of crisis.

What do you think of that?

Secretary McELROY. I, of course, wholly respect General Doolittle and his views. I am sure that he would be among the first to say, however, that the discovery of an officer who has gone through his career in one or another of the services and who can submerge his interests in that service to such an extent that he can be completely objective with respect to the various services is something which will be rather difficult to discover.

Mr. WEISL. I am sure we have felt that way, too.

Secretary McELROY. It may be worth trying.

Mr. WEISL. But we felt—when I say “we,” at least I felt, and I think the chairman felt, and I am sure some of the committee felt, that if these young officers made a career of it—that is not what General Doolittle said, but if these officers, these young officers who were able and smart and shrewd and dedicated, knew that their career would be in that particular service, and that they would not have to go back to the Army, Air Force, and Navy, their promotion would be in that career, in that service, looking only toward one object, getting the best weapons, the best defense for the United States of America, that that might be of the greatest service to the Secretary of Defense. Today we are advised by people who subconsciously might have in mind—and they believe, of course, it is for the good of the country—

but they have in mind their particular service. We have talked to each of these services, they are all wonderful people, they are all dedicated people, patriotic people, but they all believe that what they want for their role and mission is the right thing for the country.

They must be biased and they must be prejudiced for their own service.

General Doolittle thinks that if you had somebody to lean on who was not attached to any service, that might be of the greatest help to you.

I am sure you will study that or get someone to look into that and study that carefully, and see if that might not help you expedite this.

Secretary McELROY. We would like to accept the suggestion that it be explored along with other plans for improved organization of the Department.

Mr. WEISL. Mr. Secretary, I hope I have not unduly burdened you by my questions. We are trying to explore the facts to get every possible bit of evidence to help the committee, really to help you and to help the country.

Now, if there is anything that I have not asked which you think ought to be answered, or anything you think you would like to say, I wish you would say it now.

Secretary McELROY. I have no other comment, Mr. Counsel.

I will say again, to me, all of the questions you have asked have been quite appropriate, quite fair questions. I hope that my answers have helped some in establishing the record.

Mr. WEISL. They certainly have.

Thank you very much.

Mr. Chairman, that is all I have to ask.

Senator JOHNSON. Thank you, Mr. Counsel.

STEPS NECESSARY IF WE ARE TO BE EQUAL OR SUPERIOR

Mr. Secretary, the committee is aware of the fact that you are new in your job, but I want to ask you this question: What, in your opinion, should be done first, and second, and right on down the line, to assure our equality or superiority in the missile-satellite fields?

Secretary McELROY. We have authorized one move today which seems to be necessary in order to advance the date of our having operational missiles within the reachable distance of our principal enemy.

Senator JOHNSON. Without passing judgment on the wisdom of the decision, I congratulate you on the fact that a decision has been made.

Secretary McELROY. We will have to take the responsibility for the decision, and are quite willing to do so.

I would believe, first of all, that we should keep our retaliatory force in the air—I am talking about aircraft now—available to retaliate on whatever speed of response is required to meet whatever weapons are opposing us.

That means that we will have to increase the speed of our response, which means speed of alert time on the Strategic Air Command and speed of alert time on those attack plans which are based on aircraft, and so on.

The dispersal basis of the Strategic Air Command, I think is called for in this kind of a situation in order to not have too many of our principal retaliatory forces concentrated in a relatively few fields.

I think that we are going to want to make an investment in improved detection devices for the new types of enemy weapons which we may face in the future.

I think that we need to move forward as rapidly as is reasonable. When I say "as is reasonable," there is a great deal that we need to know technically in this area toward the development of antimissile missiles.

I think we need to pursue an active program in the various satellite fields which we have been exploring, some of which seem to have very definite and special interest to the country.

While the IRBM deployments that we have considered as being of urgent importance now to the country should be pursued, not only in the land-based but also in the sea-based types, the Polaris types, with the submarine deployment, I feel that we should obviously move right along in our test program and in our preparation for deployment of the intercontinental ballistic missile.

Senator JOHNSON. Are you making a reassessment of the ICBM?

Secretary McELROY. We are making a reassessment of the ICBM.

Senator JOHNSON. Are you making any reassessment of the anti-missile missile?

Secretary McELROY. Not at this point, but we are pursuing a very active testing program which is about as far as we can be with that one.

Senator JOHNSON. I don't want to interrupt you but you are making very constructive suggestions and this is what the committee is looking for.

Secretary McELROY. This is the kind of thing that has gone beyond my thinking about it here. These are things that we really plan quite definitely to include among our recommendations.

Senator JOHNSON. Have you given any thought to increasing the retaliatory power of the Army and Navy along with the Air Force?

Secretary McELROY. We think of the Polaris as being retaliatory power of the Navy.

We think of the Army as being not so much in the retaliatory, but in the occupation of ground kind of situation by posting forces on the ground.

We certainly are working and we plan to continue to pursue the subject of improved capability of our ground forces, both the Army and the Marines.

I think that with those specific exceptions, I can just fall back again on my belief, Mr. Chairman, that if we are successful in the Defense Department in setting up an agency for the successful prosecution of our research and development on advanced weapons of all types as they come along, we will have made a very major step in protecting ourselves against any loss of position. The thing that is important, in my judgment, is that we do not lose ground in relationship to an important world competitor in this weapons field.

Senator JOHNSON. And this committee can understand and through this committee the country can be assured that you and your associates who are the trustees of the defense of this Nation are going ahead to expedite plans for research and development that will put us ahead of the Russians?

SATISFIED WITH QUALITY OF ASSOCIATES

Secretary McELROY. Those are our plans, and I am sure I speak for my associates for whom I have great admiration both in the civilian and in uniform. I am glad that Mr. Weisl spoke of that because it does seem to me that the quality of people I found among my associates down here has left very little to be desired.

Senator JOHNSON. I wonder if you would take the time to organize as compactly as you can and as briefly as you can so when we meet later perhaps in either open or closed session, you can bring us up to date on the stage of development of your plans to put us out in front in research and development and at least give the committee some of your thoughts in that connection and some of the steps that you are taking or plan to take?

Secretary McELROY. All right.

Senator JOHNSON. By making a maximum effort, Mr. Secretary, in doing all that we can and as soon as we can consistently with the limitations with which we are all familiar, how soon do you think it is going to be before we can catch up with the Russians in the overall missile field?

Secretary McELROY. My problem in this is that I do not know how fast they are going to go.

Moreover, I have no assurance that they are ahead of us, Mr. Chairman. I have read what Mr. von Braun has said, and he also I regard as a very excellent man, but whether he knows positively the things that he said there I don't know.

If he does I think he has knowledge that we don't have.

I mention him only because he is one who has spoken out quite broadly in this general area.

Senator JOHNSON. I know though from the extensive briefings that you must have had that you certainly have little reason for great satisfaction and complete and absolute comfort.

Secretary McELROY. Little reason you say?

There is no question about that. I will say at every stage that my position in relationship to our program here should be based on an assumption that we must catch up.

I must say at the same time that I don't know positively that that is what we are up against.

But the timing is something I think I cannot quite have a judgment on.

GUIDELINES SET NO CEILING ON EXPENDITURES

Senator JOHNSON. Mr. Secretary, now in the budget that is presently being prepared in the Department of Defense, has any ceiling been set on expenditure?

Secretary McELROY. There was no ceiling set. The ceiling was set—the word is wrong as I have used it.

The amount that will be set will be set based on a combination of needs under an original group of guidelines, but supplemented by high-priority items to the extent that they were recommended by the Department of Defense—and a great many were—and that they were concluded in consultations with the administration.

Senator JOHNSON. Who set the guidelines?

Secretary McELROY. The guidelines were set by the Secretary of Defense.

And in my judgment that is the best way to begin a budget. I would be for that, because you at least have some figures that people have to put their minds to staying within. But if you do not freeze it there, if you then say, "Now, to the extent that you have great conviction that there are high-priority items that are not includable in that figure, we will consider those recommendations."

And that is what we have done. We have chosen high-priority items. We have also put a squeeze on what looked like lower priority items in an attempt not to take this thing too far beyond what seemed sound and right in other ways.

Senator JOHNSON. Can you give us the general target in amount, the guideline?

Secretary McELROY. The guideline as originally set was \$38 billion. But that is not the figure that will be the end figure because of our belief and the belief of the administration that there are high priority additions that should be included beyond that figure.

Senator JOHNSON. Do you expect it to be increased appreciably?

Secretary McELROY. I have been saying right along it all depends on what you mean by the term. I feel—

Senator JOHNSON. How much can we expect it to be increased?

Secretary McELROY. Moderately is what I have said.

Senator JOHNSON. Moderately?

Secretary McELROY. Yes.

Senator JOHNSON. And what would "moderate" mean to you?

Secretary McELROY. If you do not mind, Mr. Chairman, I would like not to be asked to give the figure. I think it is a little premature in offering the President's budget figure at this time, but the principal answer I would like to give is to your question as to whether there was any ceiling set, except the Defense Department recommending what it regarded as priority programs for the defense of the country, and my answer to that is "No."

DOES NOT CREDIT THE RUSSIAN BOAST

Senator JOHNSON. How seriously do you take the Russian boasting about having complete supremacy in the event of war?

Secretary McELROY. I do not take it seriously at all because I do not believe it for 5 minutes or for 1 minute.

Senator JOHNSON. Thank you, Mr. Secretary. That is a good place to end the questions.

Senator Bridges.

Senator BRIDGES. I have no questions at this time.

Senator JOHNSON. Senator Bridges, if you will pardon me, may I ask one more question I overlooked?

Did you read the five-point priority program recommended to this committee by Dr. Teller? Could I review that to you and get your comments? Dr. Teller recommended that we:

(a) Maintain and improve our SAC defense. The manned bomber is not now obsolete and will not be obsolete even when we have an ICBM. The most logical first step is dispersal of planes.

(b) Try to accelerate and expand the missile program.

(c) Study and initiate and probably inaugurate an adequate passive defense program.

(d) Attempt to accelerate the production of nuclear-powered submarines in number.

(e) Start now on a better program for science education.

Would you generally embrace those suggestions?

Secretary McELROY. I remember now reading those in the paper exactly as you have given them and I felt that the way Dr. Teller recommended this country's defense was essentially something that we could accept. I believe he did recommend a substantial shelter program; is that right?

Senator JOHNSON. Yes; that is under your passive defense. I do not want you to dot every "i" and cross every "t." I just ask whether you believe those suggestions for priorities given by Dr. Teller are constructive and worthy of serious consideration by the executive and by the Congress?

Secretary McELROY. I felt that way when I read them and I feel that way now.

Senator JOHNSON. Fine, and we would certainly express the hope that you would review the testimony of the other witnesses carefully in the hope that by all of us working together we can improve our common defense.

Secretary McELROY. Thank you.

Senator JOHNSON. Thank you, Mr. Secretary. I appreciate the candor and frankness of your answers and your courtesy of replies.

Senator BRIDGES. I have no questions. I am delighted, Mr. Secretary, that you have started to make decisions even though you are new in the office and am glad to see this decision today relative to the Thor and the Jupiter. I just hope that with the seriousness of the situation your program will be such that you will continue to clear up some of these roadblocks and we will get action as quickly as possible on this whole series of subjects.

Secretary McELROY. We are receptive to just that kind of action. The kind of thing that I regret here, as I have said before, is these urgent programs cannot go through what you might call a normal kind of testing and development which would let you make a decision that would be tighter than the kind of decision we have made today. But as has been suggested before by your committee and by others, the judgment decision sometimes has to be made in the interests of the country, and those decisions are usually more expensive than if you were allowed the time to go clear down the road. That kind of thing is done in business every day. These are a good deal more expensive to the public, but we are also playing for a good deal higher stakes, so that I guess if you can do it in business you probably have to do it from time to time in the defense.

Senator JOHNSON. Mr. Secretary, who will make the Thor and the Jupiter? Who are the contractors to make them?

Secretary McELROY. Douglas makes the Thor. Chrysler, the Jupiter. It is a combination of Chrysler and the Ordnance Department itself.

Senator JOHNSON. Is there anything you can say in open session about the approximate estimated cost, additional cost of this decision?

Secretary McELROY. I would rather hold that, if I may.

Senator JOHNSON. You would not want to say about the estimated number to be made, the time taken? You would rather do that in closed session?

Secretary McELROY. I would rather hold that one because it is to some considerable extent dependent on agreements to be made with our allies and with NATO, because as you understand, the deployment of these is not within our boundaries; and for that reason, the decision could not be ours.

Senator JOHNSON. Senator Byrd.

Senator BYRD. Thank you very much, Mr. Chairman.

Mr. Secretary, I am very happy to have you before the committee today.

Secretary McELROY. Thank you.

CONGRESS APPROPRIATED \$1½ BILLION OVER REQUESTS

Senator BYRD. Your testimony has been enlightening and very frank. I know you have made the same impression on every member of the committee as you have made on me.

Mr. Secretary, for the purpose of the record, I am going to read some figures on appropriations which indicate to me that the serious deficiency in our military establishment in the missile field cannot be attributed to the failure of Congress to provide adequate funds. In the past 4 years, through fiscal year 1957, Congress actually appropriated \$1.5 billion more than the present administration requested for the military. I assume you will agree with me that period was the most critical period perhaps in the missile development? Am I correct about that?

Secretary McELROY. I do not know what was the most critical period, Senator Byrd, and I am not trying to duck the question. Mr. Von Braun says it goes back to really right after the war, the entire period.

Senator BYRD. It certainly was critical.

Secretary McELROY. Certainly the years that you are talking about were some of the years that were critical.

Senator BYRD. I want to make it clear, I want to say this, Mr. Secretary: that if my figures are in error, I would be very glad to have your staff make a corrected statement for the record.

Now, the military departments entered the current fiscal year 1958, which began last July 1, with a total of more than \$75 billion appropriated for their expenditure—\$35.4 billion in new appropriations and \$39.7 billion in unexpended balances. Of these old balances, \$12.9 billion were still unobligated.

The Air Force had \$19.4 billion in unexpended balances for the year beginning July 1, and \$5.8 of these old balances was still unobligated. With its \$16.8 billion in new funds, the Air Force entered the year with a total of \$36.2 billion of which \$22.6 billion was not then obligated.

The Navy had \$12.7 billion in unexpended balances when the year began July 1 and \$4.3 billion of old balances were still unobligated. With its \$10.2 billion in new funds, the Navy entered the year with a total of \$22.9 billion of which \$14.5 billion at that time was unobligated.

The Army had \$7.3 billion in unexpended balances when the year began July 1, and \$2.7 billion of these old balances was still unobligated. With its \$7.7 billion in new funds, the Army entered the year with a total of \$14.9 billion, of which \$10.4 billion was unobligated.

And in the past year, Mr. Secretary, as you are probably aware, the appropriations enacted by Congress for the current fiscal year, totaled practically precisely the amount Secretary Wilson in his letter to the Conference Committee on the Military Appropriation bill said was necessary. I, of course, do not expect you to absorb all these figures from my reading of them to you, but I think it is important in endeavoring to ascertain the cause of the fact that it is admitted we are lagging behind in the missile-development field, it is important to make it clear that these appropriations were made by Congress; and that in a 4-year period totaled \$1.5 billion in excess of the requests by the President.

I am not asking you to comment on that now unless you desire to do it, but I would appreciate it if you would have these figures checked if you desire to do so, and if there are any errors I would be glad to see a statement inserted in the record.

Secretary McELROY. I will have the figures checked at your request, Senator Byrd, and other than that, I would like to reserve comment, if I may.

Senator BYRD. I have nothing further.

Senator JOHNSON. Senator Saltonstall.

Senator SALTONSTALL. Thank you, Mr. Chairman. Mr. McElroy, the purpose of this committee, as I see it, is twofold, perhaps threefold—(1) to acquaint the people of our country with the present status of our defense and what we should do about it, (2) to stimulate administrative changes and improvements, and (3) to consider any possible legislation that might come out of these hearings.

Now, I think the chairman of our committee and the counsel have brought out the purpose of the meeting very clearly, the enthusiasm that we want to stimulate in the Department of Defense, and I think counsel has analyzed some of the problems that you face.

Now, I would like to ask you just 2 or 3 questions along the lines of legislation.

In the first place, this is simply to clarify what the chairman asked. You mentioned \$38 billion in the guideline. You did not say whether that was new appropriations or expenditures. Could you just say which?

Secretary McELROY. We took \$38 billion of new appropriations and \$38 billion of expenditures both as guidelines. Now, they could not exactly coincide, but the guidelines included a common figure for both.

Senator SALTONSTALL. You stated, I think, if I heard you correctly that it might be advisable for the Department of Defense under you to have control of the total research and development fund, and then turn it over to the services for production. Did I hear you correctly?

Secretary McELROY. That would only be in the area of what I would call the advance weapons agency, and those would be at this particular time limited to the antimissile missile and to various satellite applications of a military nature.

Senator SALTONSTALL. Now, along those lines, some of us here are on the Appropriations Committee as well as the Armed Services Committee. In thinking this problem over last night I recalled that the emergency fund of the Secretary of Defense in 1955 was \$25 million. In 1956, it was \$35 million plus the authority to transfer to

the emergency fund \$50 million from any other account at the discretion of the Secretary of Defense.

In 1957, it was \$85 million plus the same power of transfer of \$50 million. And in 1958, the current fiscal year, it was \$85 million plus the authority to transfer \$50 million more. It seems to me that it might be very advisable in connection with your budget, if you did not want to get into higher funds, to cut down some of the research and development money that is specifically allocated to the various services.

We had last year, for instance, \$1.4 billion, and put a bigger amount under the control of the Secretary of Defense. What do you think of that?

Secretary McELROY. I think that will be recommended, particularly, Mr. Saltonstall, in the area of antimissile missiles, where there have been budgets supplied for activities in the past few years within the services. Now, we plan that those amounts will be requested in the new budgets for the Secretary of Defense, for the Office of the Secretary of Defense, instead of to those services. So, the thing that you are suggesting we do plan to move on.

Senator SALTONSTALL. Why should you confine it just to those two missiles? It seems to me that, if there was a bottleneck, or if one project ran out of funds or something of that kind in this situation which we find ourselves in today, would it not be better to give the Secretary of Defense more balances to work with?

FLEXIBILITY IN MOVING OF FUNDS WOULD HELP

Secretary McELROY. We would always like, if the Congress were willing to authorize this, we would always like to have greater flexibility in the moving of funds, the transfer of funds from one kind of an activity to another. I have been discussing this with our people, and I found that there has been some reluctance on the part of the Congress to do this to the extent requested. But we do plan to bring that subject up again, also, partly as a means of helping us to finance the accelerated production of IRBM's that we have announced today. But we will have to come to the Congress early in January, certainly, to request authority for construction of bases, which requires specific authorization, and we will probably have to come, also, to request transfer of authority from one type of appropriation to another, which is not permissible under our broad authority, and perhaps even to request new money. But the possibility of our having a more general authority to transfer money from one part of the Defense Department to another is one that is most attractive to us, if the Congress will give us that much flexibility.

Senator SALTONSTALL. My own personal feeling on that, I must add, is I think our Appropriations Committees are very much less willing to transfer funds between appropriations after we have gone into the appropriations and justification than to give larger ones to the original purpose. That is why I brought it up, because it seems to me you could help a lot of these problems if you had the money in your own discretion, under Mr. Holaday's advice, to put into your various critical areas.

Secretary McELROY. I would like to pursue that suggestion, and we do welcome it, Senator.

Senator SALTONSTALL. Now, the counsel, Mr. Weisl, questioned you at some length on the subject of Mr. Holaday's working relation with you. Is my understanding correct when I say that you have the power today, as Secretary of Defense, to tell the Secretary of the Navy, we will say, to make a certain contract or to break a certain contract? Do you interpret your authority that far?

Secretary McELROY. I would have authority to do that. I think, as a practical matter, I would be very unlikely to do this. This is a question that was brought up, as you probably remember, in consideration of a candidate for a position as Secretary of Defense. In other words, this is under the conflict-of-interest statute. There is no question, in my understanding, that he has the authority to have a contract made, but I think, as a practical matter, it would be the kind of thing which you would be very unlikely to say, "I order, I instruct you to sign that contract with the Douglas Aircraft Co. or with Chrysler or with any particular company."

I think it would be the kind of thing that, if you have a qualified man running one of your departments of the Defense Department, you would expect him to proceed once there was a general decision as to policy.

Senator SALTONSTALL. The counsel discussed the powers, as I say, that Mr. Holaday had, and, as I understand it, you have given Mr. Holaday all the power that you have in connection with these missiles subject to your guidance.

Secretary McELROY. Right.

Senator SALTONSTALL. Now, am I correct in my understanding of the ordinary procedure? The Secretary of Defense, as you say, makes no contracts himself. Mr. Holaday would make no contracts, but he would say, for instance, on the Jupiter, to the Army that the Jupiter should proceed, that the Army should proceed with more research, or to pursue it at an operational level, which you have done? That means that the Army Secretary, upon the advice of his research man, and out of his research money, makes the contract; am I not correct?

Secretary McELROY. That is correct.

Senator SALTONSTALL. And he sees that that contract is fulfilled. Now, assume that that contract is going in a way that is not satisfactory, or is lagging. How far have you given Mr. Holaday the power to interfere with that, to correct it, or to change it?

Secretary McELROY. Mr. Holaday follows the progress of such a contract. He would be very likely to do it with the Research Director or Research Assistant Secretary of that service. He would do it by visiting the installation at any time he wishes, without any hindrance on the part of the service permitted or even suggested, and, if there were any slowing up, he himself would suggest ways in which the slowing could be corrected, and then, if some action were needed by the Department of Defense, he would bring it to me.

Senator SALTONSTALL. So, just to carry that one step further, if there was a difference of opinion between the Research Secretary in the Department of the Army and Mr. Holaday, as your missile expert, and they disagreed, what procedure would be followed there?

CHANGE IN LAW NOT REQUIRED

Secretary McELROY. Of course, what we try to do is settle those things without bringing them to the Secretary, but, if there were a conflict which was irreconcilable on this point, it would be brought to the Secretary.

Senator SALTONSTALL. So that, for all intents and purposes, you do not need, in your opinion, a change in the law on this subject? It is a question of administering the present law satisfactorily?

Secretary McELROY. I do not think we need any change in the law. I was informed, as to my proposal for a single manager, that there is authority for such employment under the law. However, I do have an obligation, I am told by our Counsel, to notify the Armed Services Committee of the Senate and the Armed Services Committee of the House if and when we determine to take this action.

Senator SALTONSTALL. If and when you determine to take action?

Secretary McELROY. Take this action.

Senator SALTONSTALL. Oh?

Secretary McELROY. On the appointment of a single manager of an advanced-weapons agency. But it seems clearly to be within the authority of the law as it now is written.

Senator SALTONSTALL. Then within your brief time in the Department, and subject to careful reflection, you know of no changes in the law that are presently enforced that you would recommend to accelerate missile research and development?

Secretary McELROY. That is correct.

Senator SALTONSTALL. And any changes in the law would come in connection with this military planning advisory board that Dr. Bush and General Doolittle—

Secretary McELROY. This is of a far more broad nature, and there I would say I am sure that you gentlemen would want to consider along with us after we had reached a conclusion in the matter and at considerable length, because it involves the degree of change which I think you approach with very real respect and hesitation up to a point of decision.

Senator SALTONSTALL. Just one more statement and question. I was informed—I forget whether I heard it in testimony or heard it somewhere else—that actually the overtime order issued by your predecessor did not interfere in any way with research and development. It did interfere somewhat or a little in production before it was repealed; is that correct?

Secretary McELROY. Let me consult. I believe that is correct. I am informed that while the limitation applied generally, that there was a limitation on the research and development programs on these missiles, these high priority missiles but—and I am talking now on the IRBM and ICBM's—for the agency involved could request relief if that relief of overtime would accelerate the development of the research and testing program on the missile; so that we have a belief in the Department that the overtime restrictions that were put on did not actually deter the proceeding with the research and testing program on the missiles on the most rapid basis that technical knowledge would permit. That is our belief.

Senator SALTONSTALL. But did it interfere with production?

Secretary McELROY. To some extent we think it did.

Senator SALTONSTALL. Mr. McElroy, might I just say, in conclusion, I hope you will give very serious consideration to, we will say, a substantial increase in this emergency fund for the Secretary of Defense, even if it results in somewhat of a reduction in the research and development funds of the individual departments, because it seems to me that that is one place where we can accelerate quickly, because it gives you the opportunity to cut a certain amount of red tape and make a quick decision.

Secretary McELROY. That is right, it does do that. As a matter of fact, some of the money this year was used for the purpose of moving along, authorizing continuation of the Jupiter program, and that as you can see has been what seems to be up to this time advantageous development in the interests of this country.

Senator SALTONSTALL. Thank you very much, Mr. Chairman.

Senator JOHNSON. Senator Kefauver.

Senator KEFAUVER. Thank you, Mr. Chairman.

Mr. McElroy, I want to compliment you—and I am sure other members of the committee would join in that—in the grasp you seem to have gotten of the Defense Department in such a very short time, the frankness with which you have answered these questions.

I might say, Mr. Chairman, that you and I have been in the House and Senate and in my experiences this has been one of the most important, if not the most important, hearings that I have ever been present at. I think it is a great public service to have it so well organized by our counsel, but you and the witnesses have certainly cooperated. I think it will be helpful to us in Congress and the public and to the Executive, too.

Senator JOHNSON. I want to express my appreciation to the Senator from Tennessee. He has had a wealth of experience in the investigating field. I appreciate very much his remarks.

Senator KEFAUVER. I have conducted different kinds of investigations, Mr. McElroy.

Secretary McELROY. I hope I do not have to come up before you in connection with one of those.

Senator KEFAUVER. I hope I do not get into any more, but I am sure you would not be one of the witnesses.

Mr. McElroy, one thing that worries me about the setup you have in the Department of Defense is that—

Senator JOHNSON. Mr. Secretary, would you pardon me? I am going to ask the vice chairman, Mr. Stennis, to preside. I have been asked to come to a meeting at 5 o'clock and I will rejoin you just as soon as I am able to return.

Thank you, Senator Kefauver.

Senator KEFAUVER. The Department of Defense is interested, of course, in the military aspects of the missiles, satellites, space, and whatnot to the practical exclusion of just civilian aspects, is that correct?

Secretary McELROY. Yes. Our responsibility on the civilian aspects of satellites involves whatever decision another agency of Government wishes to make with respect to using us.

In that case, we are glad to offer our services if we can be helpful, but we do not consider that it is a responsibility of ours to initiate in that field.

Senator KEFAUVER. You do not consider it is your responsibility to initiate something in the civilian field, but if you have an assignment by law you would carry it out?

Secretary McELROY. Oh, yes, of course, and we are doing so.

JOINT CHIEFS ADVICE IS WEIGHTY

Senator KEFAUVER. In answer to Mr. Weisl's question as to what would happen if one of the services developed a new and improved weapon or type of missile, or thought they had developed one or had an idea for one, you said that the service would bring the matter to Mr. Holaday and he probably would talk it over with you, and then it would be referred to the Joint Chiefs of Staff to see whether it is militarily worthwhile or not, and if you found it was, and it was otherwise feasible, why, then it would go ahead.

But what if it is blackballed or turned down by the Joint Chiefs as not being of any military benefit? Would that stop the development there?

Secretary McELROY. Not necessarily, but I would say that it would certainly slow down the project, because we do look to the Joint Chiefs to advise us—this is by statute—as to the military necessity of weapons.

Senator KEFAUVER. We have been told, rather, there is information to the effect, that one of the reasons why we have gotten behind in satellites, for instance, is the Joint Chiefs and some people in the Defense Department just did not see any military importance in the launching of satellites. It was not considered to add anything to the military strength, so that emphasis should be put on something else.

Is that the kind of thing that we are going to continue to run into with this kind of operation you have, it having to be approved by the Joint Chiefs before you go forward?

Secretary McELROY. I do not believe that that conclusion was reached by the Joint Chiefs, Senator Kefauver, because there has been a great interest for some years in a military use which we can discuss later about a reconnaissance satellite that has been in the press, and I see no reason why it should not be mentioned.

There are expected to be other extreme uses of various kinds of space vehicles, and while we have not considered that we had a responsibility for the IGY from an initiation standpoint, only as an agent, nevertheless we have felt the responsibility and do feel the responsibility for any kind of military weapon development, no matter in what field it may reach so far as civilian use is concerned.

Senator KEFAUVER. The evidence is preponderant, Mr. McElroy, that in the military department there was not top priority put on the development of the satellite. And that is the reason the Russians got theirs up first. And I just wonder how you are going to prevent that kind of thing from happening again in such an important field of activity.

Secretary McELROY. I think that the type of satellite that the military was interested in required development which went way beyond the kind of instrumentation that is considered right for the IGY satellites.

I think, though, that my answer to your question is that I feel the necessity of the thing that you are talking about, which is that we do

not fail to recognize early in the game the importance of some very novel kinds of weapons which some people are sometimes likely to brush off as Buck Rogers stuff. One of the things that we are hopeful we will accomplish by creation of this advance weapons agency is that we will have a part of the Defense Department on whom the responsibility will rest for bringing to the Joint Chiefs and to the Defense Secretary's Office the potentialities of very far upstream types of weapons possibilities.

Senator KEFAUVER. Mr. McElroy, I do not believe that all of the satellite and space operations come under the term "weapons." I was very much impressed with Dr. Teller's testimony. He pointed out clearly that there must be basic research of a scientific nature—whether of going to the moon or to Mars—which has no immediate military applications.

Under the Defense Department where the primary consideration is given to weapons, is there going to be sufficient emphasis put on this kind of scientific research?

Secretary McELROY. I think that within Government, there may be some doubt as to which of the agencies is responsible for this kind of thing until it becomes apparent to the military there are military possibilities in it; and I do not mean that there should not be men who should be thinking, in the military department, about the possible application of some of these new kinds of thinking.

But it is true, as I am sure you know better than I do, Senator, the National Science Foundation and the Atomic Energy Commission and a number of areas of Government activities now have responsibility in this field. I think one of the real contributions that Dr. Killian can make, and I believe he intends to make this contribution, is to see whether there cannot be some improved coordination of the research activities in these various parts of the Government.

There is some now, but I think that it is possible to make improvements.

For example, the NACA, in aeronautics, do a lot of work which is of importance to the military.

Senator KEFAUVER. Mr. McElroy, if you do not consider experimentation in missiles, or that might have something to do with the control of the weather, going to the moon on purely scientific adventures, primarily military matters, there must be some coordination so that there will be sufficient importance given to these other features by some other agency of the Government.

"UPSTREAM" RESEARCH INDISPENSABLE

Secretary McELROY. I think so. I think what you are suggesting falls in the areas of upstream research which could be called basic research or most any kind of term you wish.

I will say in this country we cannot afford to overlook these things, and many of these will be undertaken by the Defense Department, because they seem pretty obviously to be military potentialities.

But even if there were not, in my opinion, there should be, a Government interest in exploring. I might have an example for you.

The President, in his talk in Oklahoma City, mentioned the need for investment in a couple of accelerators. I cannot do much in explaining that to you, except I do know that these accelerators that

are proposed are things which look as if they may give us some additional secrets of life, but without any specific ideas as to what they might tell us.

There has been a proposal that the Defense Department share in the financing of those, along with a couple of other agencies of Government, so that there is some coordination of a thing of that sort, although I think it could be formalized.

Senator KEFAUVER. Well, there is so much scientific development and research of tremendous importance going on, some of which might be military, some nonmilitary, but would all improve our standard of living, our protection, our future as a nation, and there has to be some coordination somewhere in all these efforts; is that correct?

Secretary McELROY. I would agree, and I think that out of the work of Dr. Killian, we may very well find that is going to come.

We could very possibly take some positive action in encouraging that ourselves. I feel confident that could be.

Senator KEFAUVER. Are you in position to state whether you think there is any merit, or would you rather reserve that to further consideration in executive session, in the idea of a Secretary of Science who would be a coordinator of all of these applications?

Secretary McELROY. I do not see any reason why I could not comment here, except I really have not given it very careful consideration, Senator Kefauver.

I have been somewhat lax in thinking about other departments of Government because of the occupation with this job; but I would feel that some type of coordination, whether it requires a Cabinet secretaryship, I do not know, but I think it is something that is quite appropriate to bring up right in this session. We like to think about how we might be more active in it.

Senator KEFAUVER. That is apparently a situation in which Dr. Killian has no authority.

Secretary McELROY. That is correct.

Senator KEFAUVER. One further question, and I have taken too much time.

We talk about interservice rivalry, but some scientists have testified here and have told us privately that one of the difficulties has been that rivalry has gotten so intense that in one segment of a service they are reluctant about exchanging information with scientists in another service; that corporations having contracts like to keep that information to themselves, protect their patent, to protect their trade secrets; that there has not been the general freedom of discussion back and forth even in a particular service, in the different units working on some scientific missile development, and certainly not as between the units and not as between the people who work for the various companies.

It is understandable how that has come about, but have you found that to exist? And, if so, I assume you can correct whatever deficiencies there may be.

IT WOULD TAKE A SMALL MIND TO WITHHOLD INFORMATION

Secretary McELROY. Well, I hope you will ask Mr. Holaday about how much of that he has found. I am sure there is some. I think it is a very small mind that would do that within the Government.

I think we do not have as many of them as I believe a good many people have been led to think. But I think it should be regarded with impatience wherever you find it, and it should not be tolerated. The problem with the corporations who are contractors under these programs, I think, is a more difficult one. I think that within Government, there should not be any of this permitted, and it should be stamped out, when found.

But I think, where you get into such things as patent questions and that kind of business, it becomes more complicated, and I do not quite know what to do about that one.

But I would think there that whatever knowledge would be developed by a contractor would become the knowledge of a service that was working with the contractor, and that knowledge then, when brought back into the Defense Department, if there were free interchange there, should be available to the other services.

Senator KEFAUVER. All right. Thank you, Mr. McElroy.

Senator STENNIS (presiding). Senator Case?

Senator CASE. Thank you, Mr. Chairman.

Mr. Secretary, I want to join with what has been said in appreciation of the candor and the frankness with which you have spoken this afternoon.

Secretary McELROY. Thank you.

Senator CASE. There were some areas in which you disqualified yourself from knowledge, but, so far as you could, within your knowledgeable experience, you have not hesitated to speak frankly to the committee, and that is what is certainly helpful.

I also want to express appreciation for the answer you gave Senator Kefauver a moment or two ago with respect to the possible interest of the Defense Department in some of these long-range research matters, such as weather modification.

Perhaps you know, and perhaps it has not come to your attention, but the work in weather modification really proceeded as a military project, originally, when the General Electric people were asked to consider ways of creating camouflage with smokescreens and things of that sort, and that led them into a study of what made it possible to maintain particles in the atmosphere or what kind of nuclei responded to certain chemicals or treatment.

That led to the Langmuir and Schaeffer experiments, which was the start of weather or cloud modification.

However, in recent years, I have had the feeling that military branches seemed to shy away from work in that field. They generally had observers in congressional hearings, but they generally hesitated to express direct interest of the services in this field.

The suggestions that have been made before this committee by Dr. Teller and others in the last few days, and your own response, lead me to think that perhaps we will not entirely abandon research in a field which has such ultimate possibilities, and I hope that the Defense Department will not hesitate to support the legislation which the Senate has already passed, and which is now pending in the House, providing for a program of research under the direction of the National Science Foundation.

The second topic I want to discuss briefly with you has to do with this problem of incentives for speeding up production.

I do not know to what extent your business experience led you to deal with renegotiation, but one of the primary purposes sought in the establishment of the renegotiation procedure was this very purpose of making it possible to pay different producers different rates for the same article in order to provide incentives for them to change over from the production of something in which they had been customarily engaged, and switch over to the production of what they had no experience whatsoever with, no price experience, something new which the Defense Department, or the Department of War and the Navy, as it was in World War II, had no price history to guide them in the letting of firm contracts.

If renegotiation has been prostituted or poorly administered, even, in some respects, so that it has failed to allow incentive payments, then that is the fault of the administration, I would say.

The problem that we had when we were working out the renegotiation procedures in World War II was, to a certain extent, the exact problem you now have, and that is, of expediting production, of getting changeovers in plants, and in developing new models or new devices where there was no cost experience.

We had to encourage speed. We could give letters of intent, but we also found that the Supreme Court pointed out in the Shipbuilding case that these unconscionable profits, when made, were discouragement to the selling of bonds and the stimulation of the war effort as a whole.

So, the renegotiation was devised as a means of protecting the public purse, and not the pricing of the defense articles so high that our dollars got less and less production, but to make a fair profit.

We had also the problem that some plants were producing on their own, with their own plant. Other plants were using Government-invested capital, Government-built plants, Government-provided tools, and the ordinary tax laws which were based upon a percentage of profit would apply inflexibly to the plant which was producing with Government-supplied capital, plant, and tools, as well as to the plant which was using its own capital.

So, the renegotiation procedure was developed to make it possible to encourage production of essential materials by both types of plants, and yet have a fair profit.

I certainly join in what counsel has said and what the chairman has indicated—we want the expediting of the production program. But, if you will pardon me, we must also remember that there are other committees besides this committee, and in the past we had a committee known as the Truman committee at one time, and yet it was shown to the country that sometimes there could be bonuses that were unjustified when you looked back over them.

So, I hope that, in your study of incentives, you will find time to go into the renegotiation procedure as originally conceived. If it has got some bugs in it, why, straighten them out.

But it was designed to provide incentives, and, at the same time, get speed in production in the supplying of new things that the Defense Department needed.

I am afraid I did not ask questions, Mr. Chairman, but this reference to renegotiation naturally intrigued me, and I wanted to venture these observations.

CONGRATULATIONS TO WITNESS

Senator STENNIS. Thank you, Senator Case.

Mr. Secretary, Secretary McElroy, let me commend you for the very fine grasp that it seems to me you have rapidly gained in the second biggest job in our Nation, perhaps, in the world, in a way.

I want to commend counsel, too, for his fine grasp of this subject matter. His examination and your frank responses are among the very best I have heard since I have been in the Senate.

I would like to add, too, I was very much impressed with the way counsel for this subcommittee, and the chairman, and the rest of the staff, have planned and worked out this entire hearing.

Certainly they deserve the thanks of all the committee, and certainly the Nation, for their splendid work and the way they have approached these duties, getting down to the real merits of these vexing problems.

I shall not try in my brief time to go over again the field that has been plowed so well by the attorney for the subcommittee, nor question you with reference to an overall authority.

I remember quite well your responses. Although I am not able to advise you on anything, on this so-called rivalry and so-called redtape in Government, I have been here longer than you have, and have had a better chance and more time to observe it. From what we have heard this week in our open and closed hearings, it seems to me that one of the tragedies of the age would be to be caught up now in the web of the rivalry between the services. We have a crying need for an overall manager for this missile program—though I have great respect for the individual services.

I do not believe, Mr. Secretary, that anything short of that will get the job done. You will be riding for a disappointment if you do not inaugurate, or at least advise the President strongly to inaugurate, an all-out program under the direction of an individual with Presidential authority.

It is with great modesty that I say this, and only after hearing the proof, in open and closed hearings, and realizing so much more vividly just what we are up against.

As I say, I am afraid, without this overall manager with the authority to act, the program will be a shocking disappointment, not only to you, but to the Nation. The decision on this point could well make the difference in our being able to get ahead and get out of the hole that it seems clear we all agree we are in.

And with great deference, I believe that authority must be at the Presidential level; authority above the Department of Defense, if necessary, and over and above the Budget Bureau, if necessary.

I am convinced it must be at that level; it must be the direct authority of the President that this person exercises.

This opinion has been strongly expressed by those that have testified here, and I hope you will hold an open mind on it as you feel your way further in this maze of the Department of Defense.

Secretary McELROY. I read your views in the press, Senator Stennis, and I do respect your service here and your right to a considered judgment, and I certainly would keep an open mind on it, even though my conclusion up to this point has been a little different from yours.

Senator STENNIS. Yes. I fully understand that.

But as a man who is making tremendous headway in grasping the tremendous responsibilities of your new position, I certainly believe that you can hold this question open until later, and I am glad to hear you say that you will.

Thank you very much.

The next gentleman on the list here for calling on is Senator Bush. Senator Bush?

Senator BUSH. Mr. Chairman, I am not going to ask any questions. A great many that I had in mind have been answered but I do want to join with you and others who have complimented the Secretary upon his very fine testimony here today. It is very reassuring in the light of all we know about the dangers that we face to feel that we have a man of your quality, Mr. Secretary, in this very important post, and I feel personally very grateful that that is the case.

So, Mr. Chairman, I am glad to yield at this point.

Senator STENNIS. Thank you, Senator Bush.

Senator SYMINGTON?

Senator SYMINGTON. Mr. Secretary, I would like to join the multitude in congratulating you on your testimony.

I have some questions here based on a memorandum shortly after the firing of sputnik. There were a number of manufacturers worried about some new rules put out with respect to their being forced to do what might be termed self-financing. At that time some of them called me and said that one of the justifications given was the necessity to stay within the debt ceiling.

At that time, therefore, inasmuch as to some extent this was coincidental with sputnik, I took the liberty of writing the President a letter, in which I suggested that if he felt there was anything Congress had done, or was doing, which held up any of our defense effort he call the Congress into special session.

I wrote him on the 8th of October, and received a reply on the 28th of October, most of which consisted of a memorandum from you. If convenient, I would like to discuss some of that memorandum.

Secretary McELROY. It certainly is convenient. I don't have the memorandum before me or the reply.

Senator SYMINGTON. I think I have the original.

Has anybody on your staff a copy?

This memorandum brings points out we have been talking about.

Secretary McELROY. I don't have it, but would you be willing, Mr. Symington, on the questions that you wanted to ask me, to read the pertinent parts?

Senator SYMINGTON. I believe I have a copy here you could take.

In your memorandum you stated, and I quote:

There is no problem confronting us at this time which would require the reconvening of the Congress in a special session.

From that it is clear, is it not, that you believe our national defense problems are not in any way being hampered by insufficient appropriations or authorizations, or too low a debt ceiling, or inadequate legislation; is that a fair statement?

I put it that way because, under the impetus of the now-known Russian developments, presumably if you did feel the Congress was in any way impairing your efforts to make us strong, you would feel we should get together and not wait some 3 months. Is that correct?

Secretary McELROY. At the time this was written you are quite right.

We were not considering that it was our responsibility to advise you with respect to the debt ceiling. I think that would not have been covered in this but certainly the other parts of your question could be answered affirmatively, that we had nothing that we could see in our picture that was an obstruction to our doing our job of supplying what we thought was adequate defense.

Senator SYMINGTON. Did you make any exception to that?

Secretary McELROY. I beg your pardon?

Senator SYMINGTON. Did you make any exception to that?

Secretary McELROY. No; I think there is no problem confronting us at this time which would require the convening of Congress in a special session insofar as the Department, as far as this Department, is concerned.

WE ARE AHEAD ON OVERALL BASIS

Senator SYMINGTON. Thank you, Mr. Secretary.

Then your memorandum reaffirmed that in your opinion Soviet Russia was not ahead of the United States either quantitatively or qualitatively in atomic war weapons, scientific devices or on an overall basis.

Your memorandum also asserted that Soviet Russia is not ahead either in nonmilitary applications of science and technology.

Do you still feel that way about it?

Secretary McELROY. When you take the statement on an overall basis, yes; we do feel that way about it.

Senator SYMINGTON. Thank you, Mr. Secretary.

Then you asserted that the United States is "still distinctly ahead of the U. S. S. R. although the U. S. S. R. may be ahead in certain specific areas."

Do you still feel that way?

Secretary McELROY. That is our belief.

Senator SYMINGTON. You make that statement, Mr. Secretary, despite the now known greater Soviet accomplishments in the ICBM, the IRBM, the testimony of Dr. Teller, General Doolittle, their accomplishments, in thrust and propulsion as evidenced by the satellite, their production of jet aircraft, and their launching of the earth circling satellites, is that correct?

Secretary McELROY. I would say the condition as given—yes; I would say so.

Senator SYMINGTON. I am sorry the hour is so late to put these questions. It is the latest I have interrogated a witness. I trust you will bear with me.

Secretary McELROY. I think so too. I would say we continue to believe that statement; yes.

Senator SYMINGTON. You also made a statement that, we are still distinctly ahead, despite the fact the Russians have around 10 times more divisions than we have, and many times more submarines; but the statement stands; right?

SUPERIORITY A QUESTION OF JUDGMENT

Secretary McELROY. That is right. It is a toting up, they have certain strengths in excess of ours and we have certain strengths in excess of theirs.

It is a matter of judgment, I am sure.

Senator SYMINGTON. Right.

Then the statements of the United States superiority in your memorandum were followed by the warning that—

placing a satellite in orbit should not be taken as the sole index of their overall scientific and technological capability.

Is there not ample evidence in other things of the Soviet scientific and technological accomplishments?

Secretary McELROY. Yes; I think we should have great respect for what they have achieved, and we do.

Senator SYMINGTON. You would not want to minimize the significance of their launching, would you?

Secretary McELROY. No; I should not.

Senator SYMINGTON. Do you agree with me that the American people have had just about enough of running down Soviet technological capacity?

Secretary McELROY. I certainly do.

Senator SYMINGTON. Thank you, Mr. Secretary.

Now, I mentioned that the Soviets have more than 10 times as many Army divisions as we have, approximately 5 times as many submarines in operation, and they have thousands more military jet aircraft units in operation. The testimony we have had from other witnesses is pretty conclusive about their advanced state of development in long- and intermediate-range ballistic missiles. I ask you frankly to detail your assertion that this country is "distinctly ahead of the U. S. S. R. in total military strength."

Secretary McELROY. I think it would be very difficult for me to give that kind of a detailed reply, but I can give you some suggestions as to areas in which I believe we have superiority which is very important.

Of course one of the major areas is in the long-range bomber areas.

One of the areas is in the area of the Navy surface ships, particularly the carrier. One of the areas is the atomic submarines which we feel are very important to us.

We don't know whether they have an atomic submarine, but we feel they do not have it.

While we feel there are certain areas, and one of them is the numbers that they have in the service, where they have an edge on us, there are certain areas where we have an edge on them, and the judgment in adding up their advantages as against ours is a matter of personal judgment in a good many instances.

TREMENDOUS IMPORTANCE OF SAC

Senator SYMINGTON. Do you believe, as some of the other witnesses have said, that probably the most important thing for us to do, inasmuch as much testimony is they are ahead of us in the ground-to-ground long-range missile field. Let's put it this way. Do you agree that SAC is important?

Secretary McELROY. I think it is tremendously important.

Senator SYMINGTON. Perhaps the most important command?

Secretary McELROY. Let me say that the protection of SAC's ability to retaliate, I think, is of the greatest urgency to us.

Senator SYMINGTON. Then do you think we should restore the production schedules for the new planes for SAC that we have taken away this year?

Secretary McELROY. Well, now, I don't quite know what that means. We are moving——

Senator SYMINGTON. Let me make it clearer.

Secretary McELROY. Yes.

Senator SYMINGTON. In the year 1957 production schedules for the procurement of new airplanes for SAC, and money for the development of new airplanes for SAC, have been reduced. There has been a slowdown and cutback in the production schedule.

Do you think that that should be changed as a result of what we now know about what the Russians have accomplished? Or do you think we should continue the policy of a slowdown and cutback, established this year for fiscal reasons?

Secretary McELROY. I would say that my judgment on SAC, and this is after careful consideration of the matter with the commanders of the Air Force, is that we have a capability to retaliate which is a capability which will meet our needs as we look down the road.

Senator SYMINGTON. Could I ask the reporter to repeat the question? I want to be sure you got it, because I don't think you quite answered it. Will you repeat the question, please?

(The question was read by the reporter.)

Secretary McELROY. I was winding up to answer you.

Senator SYMINGTON. Thank you. I beg your pardon.

Secretary McELROY. I think if you don't want the windup maybe I had better say this——

Senator SYMINGTON. I would appreciate your saying it exactly as you would like. I thought you had finished answering the question.

Secretary McELROY. No, no, I was not through.

Senator SYMINGTON. All right.

Secretary McELROY. I will go back to my original point on the essentiality of the retention of the retaliatory capacity of SAC.

I am not aware that the ability of SAC to retaliate requires a restoration of a schedule that may have been cut during 1957.

I am aware that a good deal of concern must be given to certain other aspects concerned with SAC which involves what I suggested earlier, dispersal of bases, speeding up of alert time, and earlier detection, and some redeployment of tanker facilities. All of these things cost money and quite a lot of it. I believe that it is considered by the Strategic Air Command itself that the things that we have named here take the high priority in providing SAC with its retaliatory capability.

So that I think my answer to your question would have to be within the light of the various needs in areas such as missiles. And in the light of the current capacity of SAC to provide this retaliatory capability that the current rate of production of planes for SAC looks to me as if the program is adequate.

Senator SYMINGTON. Are you through, sir?

Secretary McELROY. I am sorry.

Senator SYMINGTON. Are you saying because of priority of missiles, and so forth, and the problems of the economy that you feel we should not replace these reduced production schedules?

Secretary McELROY. I think I am saying that balancing the various and multiple needs in the area of defense.

Senator SYMINGTON. Balancing what?

Secretary McELROY. Well, there are needs for missiles as has been—

Senator SYMINGTON. Pardon me.

THE NEED INCLUDES ATOMIC SUBMARINES

Secretary McELROY. There has been need for missiles as has been made amply clear here in these hearings.

There are needs for a good many things in the various services, there is need for atomic submarines, and so on.

There must be some period at which you say to yourself, "Now to what extent is this needed as against something else." There is some relation to what we can do in this country for defense. It is always a matter of how far you can go. It could be that by spending additional money you could buy some airplanes that could be of a more advanced quality for SAC.

There is no doubt about that. But the airplane that you now have in SAC seems to be adequate to perform their mission of retaliation.

Senator SYMINGTON. Then the reason we are not replacing the production schedules which we reduced, for example, B-52's to take the place of B-36's is because of the priority fiscal requirements of missiles; is that correct?

Secretary McELROY. Well, not with missiles alone.

Senator SYMINGTON. Then priority fiscal requirements in general; is that correct?

Secretary McELROY. In general.

Senator SYMINGTON. Now we have a great many B-36's in the Strategic Air Command. We have scores of them in operation.

Senator STENNIS. Pardon me just a minute. It is the duty of the Chair to advise you, Senator Symington, that under the rules you have run over your time 6 minutes.

Shall we call on Senator Barrett and then I think we will come back to you.

Senator SYMINGTON. I would be glad to handle it that way, Mr. Chairman.

I point out that 1 Senator went 25 minutes but I am glad to yield, just so long as I can get my questions in to Mr. McElroy before the hearing is over.

Senator STENNIS. The Chair feels like he will come back to you.

Senator BARRETT. Mr. Chairman, I would be glad to yield the time here to Senator Symington if he desires to go ahead.

Senator STENNIS. All right.

Under the rules of the committee we will come back to Senator Bush again.

Do you wish to use time, Senator Bush?

Senator BUSH. No, Mr. Chairman. I am very much interested in this questioning and I would be glad to yield if necessary.

Senator STENNIS. Very well.

Senator SYMINGTON. I will be glad to yield to the Chair.

Senator STENNIS. I yield to the Senator.

Senator SYMINGTON. Let's see.

Secretary McELROY. You were saying there were numbers of B-36's.

Senator SYMINGTON. I think I have it.

Secretary McELROY. I am sorry.

RELIANCE ON OBSOLETE AIRCRAFT

Senator SYMINGTON. Now we still have scores of B-36's in the Strategic Air Command, in operational units.

That is a plane which to the best of my knowledge, is older than any combat airplane in either our Air Force or the Air Force of Russia.

It was designed originally before the United States entered World War II. It was classified flatly yesterday by General Doolittle, who probably knows as much about this as anybody, as an obsolete airplane.

We know that Russian defenses—we have been briefed on that this morning—are much improved. We have known for years they (the Soviets) have been working very hard to improve their defenses, in order to prevent our bombers getting into Russia.

Therefore, it is mathematically certain we will lose more crews, and place less bombs on target, if we have obsolete airplanes than if we have relatively modern airplanes.

For those reasons, it is hard for me to see how fiscal considerations should result in our sending crews out in obsolete airplanes. Not only, however, have we not accelerated our B-52 schedule as a result of the technological Pearl Harbor—as I believe Dr. Teller called sputnik—we have not replaced the reduced schedules in the 7 or 8 weeks since sputnik, October 4.

Do you think that is sound policy?

Secretary McELROY. I am not familiar with any cutbacks since sputnik.

Senator SYMINGTON. I did not say sputnik.

I said since sputnik we have not replaced the slowdowns and cutbacks in the production of the——

Secretary McELROY. Not replaced them.

Senator SYMINGTON. Of the B-52's.

Secretary McELROY. Well, I don't think anyone can be in favor of sending crews in planes which are likely to be shot down; if they are American boys certainly I am not in favor of any such policy.

I am also familiar with the fact that there has been a moderate, and I think quite a creditable incorporation of the B-52's into the force.

Also the B-47's, as you well know probably a good deal better than I do, are the backbone of the Force. I think it would be a fine thing if we could replace all the B-47's tomorrow with the B-58's.

It takes some time to do the thing that you would like to do, and I think that is the problem we have here. You can't do all of the things you would like to do in the period of time that you have and within the resources that you have.

Senator SYMINGTON. Of course, one gets stimulated in missiles. We chase the Russians in the missile field. Nevertheless, if we were attacked, we would have to defend ourselves with existing bomber and other forces; would we not?

Secretary McELROY. I think that that needs to be said over and over.

Senator SYMINGTON. But nevertheless, since sputnik there has been no acceleration in the procurement of modern aircraft for the Strategic Air Command; is that correct?

Secretary McELROY. There has been no acceleration in the modern aircraft for the Strategic Air Command. There has been interest, there has been accelerated interest; but I don't know whether I can say that there has been accelerated spending on the B-58.

I think it is about on the testing schedule which is now going through.

OVERTIME RESTRICTIONS

Senator SYMINGTON. There has been no accelerated interest, in the way of orders, for increasing development of the B-58, which you just mentioned; is that correct?

Secretary McELROY. I don't believe there has been any reduction that I am acquainted with in the testing program of the B-58.

If there is I will have to inform you about it.

Senator SYMINGTON. In 1957 since—

Secretary McELROY. I am not familiar with such a thing.

Senator SYMINGTON. Has there been any lifting of the overtime restrictions on the production of planes for SAC, and also for the fighter commands?

I think the directive is 4105.8, a directive issued, I believe, a day after or the day before sputnik, on overtime restrictions.

Has there been any lifting of the overtime restrictions, the 5-day week tempo on producing equipment except some lifting incident to missiles?

Secretary McELROY. There has been no relief of the overtime restrictions on aircraft production, Senator Symington, and we have had no request for relief on overtime from the Air Force.

Senator SYMINGTON. How about the maintenance and operation funds? General Doolittle pointed out yesterday that when he was flying actively, he wanted 20 hours. He said many of our pilots were limited to 5 hours.

I thought it was 4—that some pilots were limited to 4 hours. I do know that when abroad last year, some of the boys actually on the front lines were being limited in their flying time to the point where they did not believe they were being allowed enough flying time to keep properly trained.

We cut back heavily on maintenance and operation funds, and at that time I am certain the Air Force bitterly protested, because I can remember, as an ad hoc member of the Senate Subcommittee on Appropriations for military matters, we had a special hearing at the request of the Secretary of the Air Force. The purpose of this hearing was replacement of maintenance and operation funds. These funds had been reduced in the year 1957.

Do you know if they have been replaced?

Senator McELROY. In that case, too, since I have been here, there has been no request for any relief in that respect. But that does not mean that there has not been some discomfort in the maintenance and operations area. I suspect there has been.

Senator SYMINGTON. Well, regardless of whether you have been requested or whether Secretary Wilson was requested, do you happen

to know whether you have replaced the cuts that were made in maintenance and operation funds in the present calendar year?

Secretary McELROY. I would think that we had not.

Senator SYMINGTON. Thank you, Mr. Secretary.

Secretary McELROY. If there is any error in that, I will report to you. I do not think there has been any replacement.

Senator SYMINGTON. May I say that I think you are correct.

Now, in your memorandum, you brought up the fact that the Soviets were producing less vehicles—the memorandum attached to the President's letter—less steel and less vehicles than produced in the United States; and also that they have less railroad and paved road mileage.

But that is a bit of digression, is it not, from the basic issue of relative military strength?

Secretary McELROY. I think it is some digression. But I think it is not impertinent.

Senator SYMINGTON. I beg your pardon, sir?

Secretary McELROY. I say it is a bit of digression, but it is not impertinent.

RUSSIAN'S HEAVY CONCENTRATION ON STEEL FOR WAR

Senator SYMINGTON. When I was with the National Security Resources Board, the production of steel in this country was 90 some million tons. We were trying to get it to 120.

One of the reasons it was opposed by some people was that at that time the Russians were producing only 18 million tons of steel.

Then we found they were putting 50 percent of that production, or 9 million tons, into military uses. This is back at the start of the Korean war. At that time we were putting about 3 percent, or 2,700 tons of steel into war production.

In other words, with 18 million tons, we having 90 million, they were putting about 3 times more of their steel into military use.

In any case our capacity now is 120 million tons and theirs around 50 million—theirs is 56 million, my staff tells me.

So, if these ratios were going on the same, we would be putting in, say, 3 percent of 120, or 4 million; and they would be putting in 50 percent of 56, which would be 28 million.

That would be possible. would it not?

Secretary McELROY. It would be possible; yes, sir.

Senator SYMINGTON. Now, Mr. Secretary, your memorandum, in talking about the satellite, said that—

It was deliberately disassociated from our military efforts—

and that—

it was undertaken as a sincere and honest effort to contribute to man's knowledge.

I am sure it is sincere and honest.

Would you not also agree, as it now sits, that our satellite effort was a relatively small effort, relatively unsuccessful, and certainly late?

Secretary McELROY. It has been a relatively small effort, which, however, as this letter has pointed out, has been under the guidance of the scientific committee. The military has been the agent of the scientific committee, and while, now that we know the Russians have made a substantial impact on world opinion by their prior placing

of their satellite in the air, I think most all of us would have done things differently, nevertheless I think it should be understood that this was not under the determination by the Defense Department, but by the scientific world.

THE SECRETARY WAS SURPRISED

Senator SYMINGTON. I know that you came into the Department just about this time. May I say with great sincerity that I am very glad as a citizen, you did.

Were you surprised when they launched the sputnik?

Secretary McELROY. I was very much surprised. In fact, I was down at Huntsville, Ala., having just spent the day examining Jupiters, and I am unlikely to forget the time that I heard about the first sputnik. It certainly launched me into a job here on certain wings. So that would be clear to me as long as I live, certainly.

Senator SYMINGTON. Do you remember that some people did not seem to be particularly surprised?

Secretary McELROY. I do, and I suppose if I had been privy to the intelligence knowledge that had been around in the community, I would not have been so surprised, either. But I was very much surprised.

Senator SYMINGTON. Well, I was surprised some people were not surprised; because when defense authorities came before our Subcommittee on Appropriations last August, and asked for money, they said—I want to be sure I state it correctly—that this money was asked for so we would “launch the first artificial satellite.”

Now, the third part of your reply, in the memorandum attached to the President's letter, dealt with the tempo of our ballistic-missile program. You said, in that part of your memorandum:

The ballistic-missile program has had the highest national priority for several years.

That is a quote from your memorandum, and also that—

it had been carried forward with a real sense of urgency and determination, and that progress to date has been splendid.

Would you want to define “splendid”?

Secretary McELROY. I think “splendid” is what you have today; two intermediate range ballistic missiles that they believe can be made operational within a year.

Senator SYMINGTON. You would not call the ICBM setup splendid yet, would you?

QUESTION OF HOW MANY PROJECTS HAVE TOP PRIORITY

Secretary McELROY. No; I think, however, it is well advanced. I think the time has been pretty well compacted, Senator Symington, considering the relatively short period of time we have given this project this degree of priority.

Senator SYMINGTON. On this highest national priority, do you happen to know how many programs are on the highest national priority?

Secretary McELROY. I do not know. There are three, Senator Symington, all in the ballistic-missile field.

Senator SYMINGTON. There are three?

Secretary McELROY. Three.

Senator SYMINGTON. Would that figure be closer to 52 than to 3? If so, would you change it for the record?

Secretary McELROY. Yes; if I am wrong the difference between 3 and 52, I would certainly want to change it for the record.

Senator SYMINGTON. Thank you, Mr. Secretary.

Your letter of October 28 said that you were working on this IRBM, and that soon you were going to have one—and would make a decision to produce 1 of the 2.

That is now changed, and you are going to go ahead with two; is that right?

Secretary McELROY. That is correct.

Senator SYMINGTON. Does not the term "highest priority" become relatively meaningless when projects with such ratings are subjected to overtime restrictions, and control by money ceilings?

Secretary McELROY. Well, I think that is true, if the control of money ceilings means that you do not have the money to proceed.

Now, I think it was expected and intended that these highest priority projects could be maintained without overtime except the overtime which the contractors insisted was essential, and that the cost of doing this would be reduced because of the contractor operating without overtime. I do not think there is anything wrong with that as an objective.

What seems to have happened—and I do not think this was anything major in the whole thing, because it did not last very long—but what seems to have happened was that the comeback to the Defense Department for relief from overtime, where it seemed to be interfering with the high-priority progress, did not come back quite as fast as I think it was intended it should in order to provide the relief.

Senator SYMINGTON. Mr. Secretary, I do not want to quibble. I want you to know that not less than 10 defense manufacturers have protested to me that they are being held back by restrictions with respect to the 5-day week tempo and the overtime limitations. In the memorandums here which I would be glad to show you, they go into considerable detail on the nature of the overtime restrictions.

I believe the latest directive, which has not been changed, sir, had to do with the stopping of decisions at the local level with respect to overtime. So I am not trying to quibble about it, and am wondering what your thinking is. Are you going to speed this up? And, if so, what are you going to do about it?

Secretary McELROY. Are you talking missiles, Senator?

Senator SYMINGTON. Well, missiles first, then existing forces.

Secretary McELROY. You are now talking of 10 manufacturers of missiles?

Senator SYMINGTON. Missile parts and missiles, right.

Secretary McELROY. Well, of course—

Senator SYMINGTON. Has there been a complete release now on missile parts and missiles?

Secretary McELROY. There has been a release, as far as the ballistic missiles are concerned. I am talking about the IRBM, the high-priority missiles systems, and I do not think there is any problem on the others.

Senator SYMINGTON. Here is a statement as of November 1, from a company which says:

On October 1, 1957, a Department of Defense Directive 4105.8 was issued to supersede instruction 4105.48, dated June 19, 1957.

Under the new directive, overtime to make up for delays beyond the control of the contractor may no longer be approved locally. The overtime base may be defined in terms of total labor hours or labor dollars under a contract. Formerly, the overtime base was defined as the total anticipated labor hours under a contract. Overtime may now be applied on a plantwide basis if the contract-by-contract basis formerly required is impractical. Overtime may now be approved retroactively—it formerly had to be approved prior to performance.

Separate instructions to implement this new directive 4105.8 have not been received from any of the military services to date.

We repeat—there has been no evidence of liberalization of overtime rules since the Russian satellite was launched.

Now, that is a company which manufactures——

Secretary McELROY. What is the date of that?

Senator SYMINGTON. November 1.

Secretary McELROY. November?

Senator SYMINGTON. November 1; yes, sir.

Secretary McELROY. I am reminded that particular directive from which you read was one that the missiles were exempted——

Senator SYMINGTON. I beg your pardon?

Secretary McELROY. I am reminded by my associates that the particular directive that you read was one from which the ballistic missiles were exempted.

Senator SYMINGTON. Well, the contractor says they have not had anything to implement it, but perhaps they have had since November 1, or perhaps they did not get the exemption.

However, on existing forces what we must fight with now if attacked, how about the overtime? Has there been any lifting of the overtime restrictions, based on directives, on fighter planes or bombers?

One of the most important things held up, I understand, is base equipment. Are these procurement programs still on the 5-day-week tempo, with overtime restrictions?

Secretary McELROY. They are subject to the directive which you have read, still.

Senator SYMINGTON. Thank you, Mr. Secretary.

Secretary McELROY. The exemptions are limited to the ballistic missiles.

Senator SYMINGTON. Your memorandum goes on to state that certain nonballistic-missile systems have been discontinued, and others are being adjusted to provide this country with a maximum defense capability. Does that refer to the Navaho, for example?

SNARK TOOK PREFERENCE OVER NAVAHO

Secretary McELROY. Navaho would be an example.

Senator SYMINGTON. In the speech the President made, he emphasized the recent performance of the Snark, which, as we all know, is a subsonic, long-range missile. The Navaho is a supersonic, long-range missile, a logical development of air breathers of the type represented by the Snark.

If the Snark is so important—it could be easily knocked down by most of our modern fighters—why is not the Navaho logical, unless we are committing ourselves irrevocably to all-out war, in case of any trouble?

Secretary McELROY. We have the Snark. The Navaho is under development. It looked as if the successors to the Navaho would be coming along in such a way that they could be used, and that the Navaho need not be pursued. Now, you are quite right that the Snark will be superseded by a supersonic missile, when the supersonic missile is available, but the Snark, I think, should not be regarded as no weapon simply because it is an air breather.

Senator SYMINGTON. In other words, you think the Snark will be replaced by a rocket; is that correct?

Secretary McELROY. I would think so.

Senator SYMINGTON. Now, in the next section of your reply about the lagging of the anti-ICBM development, you did not say that the program was lagging due to fiscal restrictions, but you did say it was a complex and expensive program. I am just wondering if the fiscal restrictions on the antiballistic-missile missile have now been lifted.

Secretary McELROY. The problem on the antimissile missile, in our judgment, is not a fiscal problem, but is a technical problem.

Senator JOHNSON. Senator Symington, would you yield?

Secretary McELROY. I am not familiar with any restriction on financing which is restraining the effort which is technically possible in the antimissile-missile field.

Senator SYMINGTON. Mr. Chairman, may I make a comment to that, and then yield to the Chair?

If you find that there was, at least as of the time of my letter, a fiscal limitation on the antiballistic-missile missile, will you correct the record accordingly?

Secretary McELROY. I am not saying that there was not a fiscal limitation, but what I am saying is that the fiscal limitation was not the limiting factor in the progress of the antimissile-missile program.

Senator SYMINGTON. Thank you, Mr. Secretary.

Mr. Chairman.

Senator JOHNSON. What is the pleasure of the committee about recessing for dinner? We previously announced that we were going to have an evening session. We hoped that we could complete the testimony of Secretary Quarles and Mr. Holaday. It now appears to be impracticable or impossible. We would like to go on, after we conclude with the Secretary, with Secretary Quarles.

Senator Stennis needs to leave, and I am sure there are other Senators who would like to know what time we will convene this evening.

If it is agreeable, I would like to make a suggestion that we go on with the Secretary for another 10 minutes, in case we can complete the questioning in that time, and that we reassemble at 7:45 to hear Secretary Quarles.

If we have not completed with the Secretary, we will continue with him, and put Secretary Quarles on at the conclusion of the Secretary's testimony, provided it is not too late this evening.

What do the members of the committee feel about that? Senator Symington, do you have any preferences in the matter? Would you prefer—

Senator SYMINGTON. All I would like to do is get a chance to ask my questions. The President sent me this long memorandum from Secretary McElroy; and I have been working on my analysis of it for some days now, and have covered 1, 2, 3, 4, 5 pages of the analysis, and still have 6. I believe this analysis is important to national security.

Also, I have some questions I would like to ask the Secretary, based on some of the statements he made about the organization of the missile picture, which to me, as one ex-businessman to him another ex-businessman, I do not understand.

But I would be glad to adjust my time any way the chairman would like.

Senator JOHNSON. Well, as you know, each Senator—it was generally agreed that each of us would question the witness 10 minutes, and then rotate an additional 10 minutes, and certainly there is no disposition for anyone to interfere with your questioning or keep you from having a reasonable length of time.

We do have plans to conclude the hearings, and we want to be fair to all Senators, and certainly lean over backward to be sure that you are accorded equal opportunity to question these witnesses.

I had understood that the Secretary had made arrangements, dinner arrangements, in anticipation that he could be through before 7 o'clock.

Secretary McELROY. I have such an engagement, Mr. Chairman. I am available to this committee first, and if that is the desire, I can change that. It involves an international kind of commitment, but I think that probably can be changed.

Senator JOHNSON. Do the minority members have any discussion they care to offer?

Senator BUSH. Would you repeat your suggestion?

Senator JOHNSON. I suggested we continue with the Secretary until 6:15, and then we take a recess until 7:45.

Senator BUSH. I move that.

Senator CASE. Mr. Chairman, I was just going to suggest in view that this involves some international angle, to the thing that possibly we could proceed until about 6:30, and let those Senators who have not a question at all, I think two of them, complete by 6:30 and then let Senator Symington have all the time he wants on the second go-around.

But perhaps——

Senator BARRETT. We waive it.

Senator JOHNSON. As I understand all of the Senators waived their time and this is the second call. Then without objection, the committee will continue until 6:30 at which time we will take a recess until 8 o'clock.

At which time we will resume with whatever witness it is necessary to resume with.

Senator Symington?

Senator SYMINGTON. Mr. Chairman, I would like to follow what Senator Case said; I yield to him now.

Senator CASE. I have already had my go.

Senator JOHNSON. He has already asked his questions.

Senator SYMINGTON. I thank the Chair.

Now, the part of your memorandum, Mr. Secretary, dealt with, and I quote—

recent fiscal measures taken by the Department of Defense justifying the cutbacks and stretchouts and fluctuations of the Department of Defense program.

You referred to and I quote—

the \$38 billion expenditure estimate contained in the fiscal year 1958 budget submitted to and accepted by the Congress.

In fact you refer twice to the expenditure level for fiscal year 1958 as "accepted by the Congress."

You are not attempting to leave the impression, are you that the President's expenditure estimate as contained in the budget document is passed upon by the Congress?

Secretary McELROY. I would not say it is passed on.

The thing that is authorized of course are the appropriations. I assume the figures that are included therein the expenditure estimates are concurred in, I don't know what action is taken, I don't believe any action is taken.

Senator SYMINGTON. There is no relationship between authorization and appropriation by the Congress.

Secretary McELROY. That is right, not necessarily.

Senator SYMINGTON. And whatever money that the President and yourself decided to spend is there. You have an overall figure, a total of the money actually appropriated by the Congress.

Secretary McELROY. That is right.

Senator SYMINGTON. As a matter of fact, when you applied the \$38 billion rigid ceiling—rigid was the word used by Assistant Secretary McNeil before the Appropriations Committee—you had \$70.8 billion available, did you not?

Senator STENNIS. Let's have quiet, please.

Secretary McELROY. There was more authority than the \$38 billion, of course, and there has to be in order to fund the part of the programs that have to be funded years ahead.

Whether the figure was 70, I don't know.

Senator SYMINGTON. I think it was 70.8.

Secretary McELROY. Yes.

Senator SYMINGTON. And I think even leaving aside funds for military assistance, \$10 billion of that total was unobligated, is that correct?

Secretary McELROY. I don't know that it is.

Senator SYMINGTON. The President's fiscal year 1957 budget document contained a defense expenditure estimate for that fiscal year of \$36 billion. But the actual expenditures were 38.4 billion.

So I present that there is no relationship between the budget document and actual expenditures, so far as the Congress is concerned, if the money has been both authorized and appropriated.

I believe it is correct that the expenditure item in the budget document is an estimate; and is treated as such.

It is neither approved or disapproved by the Congress. That is correct, is it not?

Secretary McELROY. Yes, I would say that is my impression. I believe that is true.

Senator SYMINGTON. Thank you, Mr. Secretary.

Now you refer to, and I quote:

Reductions made by the Congress in the Defense Department fiscal year 1956 budget request.

I think the record will show, however, that most of the differences between the President's initial 1958 budget request of 38½ billion, and the amount finally appropriated, was the result of reductions made by the administration's failure to request restoration of House cuts, including messages sent to the Congress saying certain of these reduced funds were not needed.

That is correct, is it not?

Secretary McELROY. Well, that is not my understanding, Senator Symington.

Senator SYMINGTON. Well, now, let's review it.

The original budget request was for \$38½ billion. The President himself first cut that \$500 million. Then the House took 2,600 million more from that 38 billion. The President went before the people on television and said he would accept 1,400 million of that cut.

But he added that he had to have the billion, two hundred million remaining out of the two billion six, else the country would be in very heavy trouble from the standpoint of security. The Senate voted to give him back 971 million of that billion two. Then the Senate went to conference with the House. While at conference, messages came from the Department of Defense and the Bureau of the Budget that the billion two was not needed after all. Is that correct?

Secretary McELROY. I don't know that.

Senator SYMINGTON. I think you will find that that is the record.

Secretary McELROY. I am not—you are talking—

Senator SYMINGTON. Secretary Quarles is shaking his head. We will have an opportunity to discuss it with him. We, in the Senate, know what happened. As a result of the messages from the Bureau of the Budget and the Department of Defense the net restoration of the billion two, was 200 million or thereabouts; 197 million to be exact.

Now, your memorandum justifies the fiscal actions taken by the Department of Defense by referring to the necessity for "keeping within the statutory debt limit imposed by the Congress."

But the record will show that in the 3 preceding fiscal years the President requested increases in the debt limitation, and even though they were temporary, each time they were granted by the Congress. Inasmuch as the story I was getting all over the trade was that the reason being given by Department of Defense officials for forcing companies to finance themselves was the necessity to stay within the debt limit. I thought it would be a good idea to get the matter cleared up by submitting it in special session to the Congress. Your memorandum confirms that thinking by stating—

Referring to the necessity for keeping within the statutory debt limit imposed by the Congress.

If this was in any way preventing you from having an adequate defense structure, why didn't you request a temporary increase in the debt ceiling this year as you have for the past 3 years, especially as each time you got it?

Secretary McELROY. I don't have the answer to that one either, Senator Symington, I don't know.

Senator SYMINGTON. I am only quoting your own memorandum on that, sir.

Secretary McELROY. Yes, I understand.

Senator SYMINGTON. I don't mean in any way to be "pushy." I just want to understand. Would you be good enough to furnish an answer for the record at this point?

Secretary McELROY. Yes, we will; if the reporter will give me a copy of that question I will be glad to give you an answer.

Senator SYMINGTON. I think you will get the question tomorrow, the whole record.

Secretary McELROY. All right.
(The Department of Defense's memorandum on request for increase in the debt ceiling is as follows:)

REQUEST FOR INCREASE IN THE DEBT CEILING

It is not within the purview of the Secretary of Defense to deal specifically with the question of the debt limit. However, it is undoubtedly accurate to say that the executive branch would have requested an increase in the debt limit if it had been felt that the existing debt limit would prevent having an adequate defense structure. This was not considered to be the case.

The executive branch position on staying within the debt limit was stated in the following letter from the Secretary of the Treasury to the chairman of the House Committee on Ways and Means and to the chairman of the Senate Finance Committee.

THE SECRETARY OF THE TREASURY,
Washington, August 28, 1957.

HON. JERE COOPER,
*Chairman, Committee on Ways and Means,
House of Representatives, Washington, D. C.*

MY DEAR MR. CHAIRMAN: As I assume the responsibilities of the office of Secretary of the Treasury and review the situation which confronts the Treasury for the fiscal year which began July 1, I am concerned with the small margin which present forecasts indicate will exist between our financial requirements and the statutory debt limitation of \$275 billion.

During the past 3 years, the Treasury has been operating under temporary year-to-year increases in this limitation—\$6 billion increases during fiscal years 1955 and 1956 and \$3 billion for the year ended June 30, 1957. Even with this leeway, the effective management of Treasury financing has been difficult and, at times, more costly expedients had to be adopted to operate within the debt limit.

In part, the difficulty is caused by the seasonal peaks in collection of corporate income taxes. While the corporate collection plan has been changed by law and collections are gradually being leveled off, it will take 2 more years before corporate tax collections are on a relatively even quarterly basis. In the meantime, the Treasury must borrow large sums in the first half of the fiscal year (July–December) to meet expenditures and pay off such borrowing in the last half of the fiscal year. This happens even though we operate with a budget surplus, as has been the case during 1956 and 1957 and as estimated for 1958.

The best present estimates for the current fiscal year indicate that, during the period October 1957 until March 1958, we shall be within a few hundred million dollars of the \$275 billion debt limit with, at times, very small cash balances. This not only interferes with orderly debt management but gives little margin to meet unexpected contingencies.

However, realizing the importance of keeping within the lowest practicable debt limit, we are ready to try to operate within the present limit. We can do so safely only if there is full understanding of the problem on the part of both the executive departments and the Congress.

Within the administration, this matter has been discussed fully, and I can assure you that every effort will be made to operate within the President's budget.

It is possible that, despite our best endeavors, situations might develop requiring an increase in the debt limit. However, I hope that, by mutual cooperation, we can avoid that contingency.

I have felt I would be remiss in my duties if I failed to bring a current analysis of this matter to the attention of the Ways and Means Committee of the House. I am sending a similar letter to the Chairman of the Senate Finance Committee.

Sincerely yours,

ROBERT B. ANDERSON,
Secretary of the Treasury.

Senator SYMINGTON. Now, you refer to the \$38 billion expenditure ceiling, in the memorandum that the President sent met, as—

not as an arbitrary limit on defense spending but as a step taken by the administration to keep military spending in appropriate balance with the requirements of the Federal Government as a whole.

Testimony by top civilian officials of the Department of Defense challenge this statement. As I mentioned, the Assistant Secretary (Comptroller) said there had always been some guidelines and restrictions; but now these were rigid ceilings. That was his statement.

What would you comment on that?

Was it an arbitrary limit on defense spending or wasn't it?

Secretary McELROY. Well, there was a limit for a period but, of course, since then, as I think is well known, there has been a change.

There has been relief in the spending for the fiscal year, so while there was an attempt to set a limitation it was found that that was not right in relationship to the needs of defense and that it was relaxed to the extent of several hundred million dollars.

THIRTY-EIGHT BILLION DOLLARS WAS "OBJECTIVE" FIGURE

Senator SYMINGTON. And, inasmuch as the directives were actually issued to implement the \$38 billion ceiling, would not that, in effect, challenge any statement that it was not an arbitrary defense limit?

Secretary McELROY. Well—

Senator SYMINGTON. It would seem so, Mr. Secretary.

Secretary McELROY. I think it would be essential that there be some attempt to arrive at a figure that would be your objective figure in any kind of spending. If you do not have that, the thing can go almost anywhere. I think there is no question that there was an objective figure of \$38 billion.

Senator SYMINGTON. I won't pursue it, Mr. Secretary; only to ask would it not be more in the interests of United States security if we attempted to keep defense spending in "appropriate balance" vis-a-vis known Soviet strengths, rather than in relation to the requirements of other departments of the Federal Government?

Secretary McELROY. Well, if we do not determine our defense spending in relationship to defense, defense against our obvious opponent, then I think we are not proceeding as we should.

That part of it I would check with.

Senator SYMINGTON. Thank you, sir.

Now, there is a part of your memorandum I did not understand. It said that this country will not be able to spend adequately for the development and production of new weapons, or even maintain such development and production unless we are successful in holding down expenditures for operation and maintenance, for personnel, and for facilities.

What does that mean?

Would that imply we have a rigid ceiling still on existing forces after sputnik?

Secretary McELROY. We don't have a rigid ceiling. As I have indicated, we have relieved the pressures on the essential items in the military budget.

Senator SYMINGTON. Let me read your memorandum again.

Your memorandum states this country will not be able to spend adequately for the development and production of new weapons or even maintain such development and production unless we are successful in holding down expenditures for operation and maintenance for personnel and for facilities.

Just what does that mean?

Secretary McELROY. I think maybe I can develop that for you.

All of our equipment today as compared with 4 or 5 years ago, and I am sure I don't need to tell you this, Senator, is considerably more expensive per unit than it was 2, 4, 6 years before.

I recently had some calculations given to me on the relative costs of certain representative items in the defense arsenal.

The increases have gone up a great deal faster than has the increase in our productivity in this country, the base on which we have to obtain our tax collections.

It seems apparent that if we are going to continue to make more and more complex weapons systems with each of them being more and more expensive, that as you move forward you will have to look to the increased effectiveness of those weapons systems as letting you gradually reduce the numbers of people in your Armed Forces.

It looks almost as if that becomes inevitable. That is not necessarily true but it looks to me to be so.

So that I would say that that would be my development of the point that you have raised here, and just to give you an example of what I am saying, because I think it is a matter of very serious matter to the whole country, in World War II a carrier, an attack carrier, aircraft carrier, cost something in the range of \$50 million.

That would have been in 1945. In 1953-54, an attack carrier cost something in the range of \$200 million, and the atomic attack carrier cost about \$300 million.

CUTS IN AIRPLANES NOT REPLACED

Senator SYMINGTON. Well, one reason I ask is that if these hearings had only been on the basis of missiles and satellite, they would not have covered the whole picture.

We cannot fight with what we have not got. We can try to obtain what is necessary as soon as possible.

Today the Russians are putting pressure on Turkey.

Of course that is of interest to you as Secretary of Defense. If we are attacked we have to fight with what we have. Isn't that correct?

Secretary McELROY. That is correct.

Senator SYMINGTON. You cut our airplanes in 1957 over a third as against the original budget you presented at the beginning of 1957. Have you done anything to replace those cuts?

Secretary McELROY. No.

Senator SYMINGTON. You have not?

Secretary McELROY. No.

Senator SYMINGTON. Why not?

Secretary McELROY. Well, the answer has got to be, Senator Symington, that your ability to finance the defense effort has got to be considered in all of its aspects. The judgment of the administrative agency, while it may be wrong, also has to be a judgment that is taken; and the judgment that was taken was that the essential Air Force equipment for the needed retaliatory capability was there. While, of course, we would like to have that better, it was regarded as the kind of equipment which could do the job and that seemed also to be the view of the operating people that had the job to do.

Now, I think every part of the Defense Department program could be criticized on the basis that you are criticizing—

Senator SYMINGTON. I am just asking, I am not criticizing.

When the Chief of Staff of the Air Force came before our committee, he said that the budget he was presenting, with the much higher airplane figure was a marginal budget.

He said he was worried about it. He said he thought it might be too little. He said definitely nothing could be taken out of it without affecting our national security.

Now we have taken over 33 percent out of it; and we have not replaced one plane since sputnik.

Secretary McELROY. Thirty-three percent of the money?

Senator SYMINGTON. Procurement of airplanes, in numbers.

Secretary McELROY. Of the number of airplanes?

Senator SYMINGTON. That is right.

Secretary McELROY. Well, of course you apparently are counting 1 airplane as 1 airplane. There has been—

Senator SYMINGTON. Well, I could give it to you the other way. I did not mean to quibble about it, or to be disingenuous about the figure.

But it is a 33½ percent reduction in the number of planes.

Secretary McELROY. You would not suggest that it is a 33½ percent reduction in the number of dollars?

AMPLE PROVISION FOR SERVICES WOULD MEAN TAX INCREASE

Senator SYMINGTON. I never said that. But in my opinion if I still had sons in the services, I would think the heavy reduction in maintenance and operation funds which could only result in more accidents, is a more serious matter than money. I wonder why none of these planes have been replaced since sputnik.

Secretary McELROY. I don't know except in the general terms that I say the needs of the services are way beyond the capacity of this country simply to provide tax funds unless there is a general willingness to increase taxes.

I have not heard anybody suggesting that that is the thing we should do in any broad way.

I have heard some suggestions that that might be required.

Senator SYMINGTON. Well, of course, there are some of us who think that if we adopt such ideas as the Cordiner report, plus some of the recommendations of the Hoover Commission, and have a real weapons system evaluation program for the first time since World War II, we would not need any more money than we are spending now. I am glad to have you say frankly it is a question of the problem of facing additional taxes, and not a problem of facing possible additional Soviet strength, because that was the point I wanted to bring out.

Senator STENNIS. Excuse me. The hour upon which the committee has agreed for recess has arrived, gentlemen, and the committee will therefore take a recess until 8 o'clock.

Mr. Secretary, will that 8 o'clock take care of you all right?

Secretary McELROY. I have a dinner appointment. It will take care of me as far as my dinner appointment is concerned.

I mean I will have to cancel it if that is what is desired by the committee.

Senator STENNIS. I thought that it was understood, we agreed upon the 8 o'clock reconvening hour, and I thought that took care of your situation.

Secretary McELROY. No, Mr. Chairman.

Senator CASE. Mr. Chairman, I thought it was stated that we start with whatever witness was available so if the Secretary feels that it is necessary for him to make that engagement we could proceed with the Deputy Secretary.

Senator STENNIS. That will be a matter within the discretion of the Secretary as to when he will return.

If it takes beyond 8 o'clock we can proceed with Secretary Quarles.

Senator CASE. And with the understanding that the Secretary will return so that Senator Symington will pursue his questioning.

Senator SYMINGTON. I had nothing to do with the scheduling of the hearing.

I simply told the chairman I was available any time day or night, because I believed the security of the United States was of paramount interest. ■

I would like to have the opportunity to question the witness and I would be entirely willing of course to do whatever the chairman considers proper in order to have that opportunity.

Senator STENNIS. Is there objection now to the committee taking a recess until 8 o'clock with the understanding if the Secretary cannot be here he will return as soon thereafter as he conveniently can but the committee will proceed in the meantime with Secretary Quarles if necessary?

Is there objection?

Secretary McELROY. I have no objection. I would like to ask whether it is permitted for a witness to return in a different kind of garb.

Senator STENNIS. Yes, that will be entirely all right.

We will take a recess until 8 o'clock.

(Whereupon, at 6:30 p. m. a recess was taken until 8 p. m. of the same day.)

EVENING SESSION

Senator JOHNSON. The committee will come to order.

Mr. Quarles, would you please stand and raise your right hand. Do you solemnly swear that you will tell this committee the whole truth and nothing but the truth?

Mr. QUARLES. I do, sir.

TESTIMONY OF HON. DONALD A. QUARLES, DEPUTY SECRETARY OF DEFENSE

Senator JOHNSON. Mr. Quarles, you have probably had longer and more extensive experience in this field than almost any other high official in the Pentagon. The committee is anxiously awaiting your testimony. There are many decisions and many actions upon which I think you are the best-qualified man to shed light.

I understand you have had a long career in both industry and Government. Your experience covers both research and production. In order that the record will be complete, I am asking the reporter to insert at this point your biography which sets forth your experience and your qualifications.

(The biography of Mr. Quarles referred to is as follows:)

DONALD A. QUARLES, DEPUTY SECRETARY OF DEFENSE

Mr. Donald A. Quarles was born in Van Buren, Ark., July 30, 1894. He entered Yale University in 1912 and graduated with a bachelor of arts degree in 1916. He enlisted in the Army in May 1917, served 2 years in France and Germany, and was discharged with the rank of captain in the Field Artillery.

Employed as an engineer by the Western Electric Co. during 1920 and 1921, Mr. Quarles studied theoretical physics as a part-time student at Columbia. Joining the inspection engineering department of Western Electric in 1924 (which became the Bell Telephone Laboratories the following year), 4 years later he was in the outside plant development department, being placed in charge of this department the following year.

From 1940 to 1944, Mr. Quarles was director of the transmission development department which concentrated on military electronic systems, particularly radar, of Bell Telephone Laboratories. He was then appointed director of apparatus development, and in 1946 also became a member of the newly established Committee on Electronics of the Joint Research and Development Board, Department of Defense, and in 1949 he was named Chairman of that Committee.

Meanwhile, in 1948, Mr. Quarles was designated vice president of Bell Telephone Laboratories. He was made vice president of Western Electric and president of Sandia Corp., a Western Electric subsidiary which operates the Sandia Laboratory in Albuquerque, N. Mex., for the Atomic Energy Commission, on March 1, 1952.

On September 1, 1953, he was appointed Assistant Secretary of Defense (Research and Development). Selected jointly by the Secretaries of Defense and Commerce to be the first Chairman of the reorganized Air Navigation Development Board in January 1954, 2 months later the President appointed Mr. Quarles a member of the National Advisory Committee for Aeronautics.

Previous to his present position Mr. Quarles had served as Secretary of the Air Force, having been given an interim appointment by President Eisenhower on August 11, 1955, and sworn into office August 15, 1955. He was confirmed by the Senate February 16, 1956.

Mr. Quarles was nominated to be Deputy Secretary of Defense by the President on March 26, 1957. His nomination was confirmed by the Senate on April 9, 1957, and he was sworn into office on May 1, 1957.

Senator JOHNSON. The committee is pleased to have you here. We apologize for the length of the session today and the necessity of calling you this evening. But the urgency of the problem at hand, with Thanksgiving just upon us, we think that we should attempt to complete the schedule we have outlined. We appreciate your coming here, and if counsel will proceed with the questioning, we will get on.

UNDERESTIMATION OF OUR STRENGTH DANGEROUS

Mr. QUARLES. Mr. Chairman, might I say just a brief word. First I want to thank you for your very kind words and express appreciation that you would be willing to come this evening to extend this hearing, and I am very happy to be here and to do everything I can. I sensed this afternoon as I listened that we were all emphasizing one aspect of the problem that we have, namely, the aspect of recognizing our weak points and finding in every possible way that you and we together could find a correction for them.

It seems to me that perhaps we might be in danger of creating a world impression that our weak points are weaker than they actually are at this time, and I think you will agree, Mr. Chairman and gentlemen, that it is a very important thing for us not to err on that side as well as not to err on the side of either complacency or failure to recognize our weak points, and to make every effort to correct them.

So if I in attempting to answer your questions or to testify here seek to keep this thing on the balance of not either overemphasizing

our weaknesses nor, I trust, giving you any impression whatever of complacency, I think you will understand, Mr. Chairman, why I am doing that.

Senator JOHNSON. I certainly understand, and that is the viewpoint, I hope and I think, of each member of this committee.

Mr. QUARLES. I am sure it is.

Senator JOHNSON. As I stated on yesterday, the times do not call for either hysteria or siesta.

Mr. QUARLES. I have noted your expression, Mr. Chairman, and I thought it was very well expressed.

Senator JOHNSON. Mr. Counsel, will you proceed with the questioning.

Mr. WEISL. Secretary Quarles, would you be good enough to state what positions you have held in the Government?

Mr. QUARLES. I was for some time a member of and then Chairman of the Electronics Committee of the Research and Development Board. That perhaps was not a position in the Government in your sense.

I first became a member of the Government, came into the Government, in 1953 as Assistant Secretary of Defense for Research and Development. In the summer of 1955 I passed from that job to the secretaryship of the Air Force. And last May 1 I became Deputy Secretary of Defense, which I now am.

Mr. WEISL. Mr. Secretary, the document which Senator Symington so ably and so thoroughly questioned Secretary McElroy on was prepared when?

Mr. QUARLES. I cannot answer that with precision, but it was prepared, of course, shortly before it was dispatched, and I think that dispatch, Senator Symington said was October 28. Do I remember correctly?

Senator SYMINGTON. That is right. It was dated October 28.

Mr. WEISL. When did the preparation of this document begin?

Mr. QUARLES. Again we, of course, received a copy of Senator Symington's letter to the President shortly after it was dispatched, I presume around the 10th of October just roughly. And we certainly started considering a response to it around that time.

Mr. WEISL. How long had Secretary—

Mr. SYMINGTON. Will counsel yield there for the record? The date was October 8 that I mailed the letter and I had an acknowledgment from the White House within a week that it would be answered. I thank the counsel.

Mr. QUARLES. Thank you very much.

Mr. WEISL. How long had Secretary McElroy been in office when this document was prepared?

Mr. QUARLES. The record will show that he was sworn in as Secretary of Defense on October the 10th, was it not? I would have to correct that from the record, but it was about that time, Mr. Counsel. (Secretary McElroy was sworn in on October 9, 1957.)

Mr. WEISL. And he had very little background in these matters at that time, is that not correct, Mr. Secretary?

Mr. QUARLES. I should say that relatively speaking he did have, although, of course, he had devoted some considerable amount of time in prior weeks to becoming acquainted with the defense problem.

Mr. WEISL. Who prepared the document?

Mr. QUARLES. It was prepared by a number of people, and I cannot say again just who they were because a number of departments participated in the reply, Mr. Counsel. I participated in it at one stage, but it was largely prepared in the staff sections of the Defense Department.

Mr. WEISL. And who supervised the preparation of it?

Mr. QUARLES. I think it is fair to say that in a final sense Mr. McElroy did, and acting for him and in his behalf, I certainly did to some degree.

SAC TOP PRIORITY DETERRENT TO WAR

Mr. WEISL. Senator Symington very properly pointed out that the greatest defense that we now have against a possible attack by the Soviet Union is SAC and he very properly pointed out that that department should be given every maximum strength. Now, is that the only weapon or the only branch that we have to repel an attack?

Mr. QUARLES. No, it is not, Mr. Counsel. As you are well aware, while SAC constitutes the bulk of our retaliatory striking force, of course, it in a literal sense is not designed to repel attack but to prevent one from being formed against us. However, it is certainly a top priority deterrent to war, and I think perhaps that is the sense with which you ask the question. But it is by no means the only one. In fact, one could name many others.

Mr. WEISL. Our country is in danger of an attack by submarines launching guided missiles against our coastal cities; is that not true?

Mr. QUARLES. I would say that is one of the dangers; yes, sir.

Mr. WEISL. And the United States Navy must be fully equipped to its maximum strength to destroy and kill submarines in such an eventuality.

Mr. QUARLES. I would agree that the United States Navy is an important defense against submarines and submarine-launched missiles; yes, sir.

Mr. WEISL. And the ability of the aircraft carrier to launch jet planes into the heart of the enemy might also be a deterrent, might it not?

Mr. QUARLES. It certainly is one of them; yes, sir.

Mr. WEISL. And the Navy must also be kept in preparedness for limited wars if they may come.

Mr. QUARLES. That is also very true; yes, sir.

Mr. WEISL. And the Army must be kept in readiness and in full strength for limited wars, if they should come.

Mr. QUARLES. When you say "in full strength" that is a word I have not heard defined, but we certainly must consider the strength of the Army in relation to limited wars.

Mr. WEISL. What responsibilities have you had, Mr. Quarles, in the missile program?

Mr. QUARLES. Of course, I go back to my own experience in industry. I am not quite sure how far you wish me to go back in response to that question.

Mr. WEISL. I understand, to make it easy for you, that in 1945, as early as 1945, you worked on missiles for the Western Electric Co.

Mr. QUARLES. And the Bell Telephone Laboratories; that is correct. And I was not quite sure that your question led back that far, but since you have mentioned that, I might say that all through World

War II I was very much interested in and had some part in the development of military electronics, with some missile work during that period, and after World War II, our laboratories and our factories became very much involved in the development and production of guided missiles of various kinds.

Mr. WEISL. In preparing for a defense against a possible enemy attack, I know that the Department has been concerned with the capabilities and the strength of the enemy or the potential enemy.

Mr. QUARLES. Yes, indeed, sir. That is exactly right.

Mr. WEISL. Have you given that very much consideration in your present capacity?

Mr. QUARLES. I have given it very careful consideration throughout the period of my actual holding of office in the Department of Defense.

Mr. WEISL. My associate, Mr. Vance, tells me that I did not give you an opportunity to complete your experience in the missile program. If I did not, please proceed.

Mr. QUARLES. I hope you will pardon me if I do not tell you as much as you wish to know, but just very briefly, after my experience in the Bell Telephone Laboratories and the Western Electric Co., I went to become the president of Sandia Corp., a contractor of the Atomic Energy Commission, responsible for the development of atomic weapons and warheads. And my responsibilities there related to missiles in the sense that it dealt with the warheads for such missiles.

I came from there to the Government, and in my capacity as Assistant Secretary of Defense for Research and Development, I had certainly very considerable contact with the missile program of the services, and dealt with the research and development aspects of those programs.

Of course, as Secretary of the Air Force, again I had responsibility as such for the missile programs of the Air Force, not implying that the Secretary does more than you understand full well the Secretary does, and then in my present capacity I certainly continued to be very much interested in the missile programs of the military departments.

Is that, Mr. Counsel, about the kind of coverage you wish?

QUARLES BELIEVES WE ARE AHEAD ON WHOLE MISSILE PROGRAM

Mr. WEISL. Yes, sir.

How do you estimate what our present position is from your experience and the information that you have gathered concerning the strength of Russia in the field of long-range missiles, intermediate missiles, and other missiles?

Mr. QUARLES. I will have to break that question into parts because, as you realize, it has different answers in different parts.

Taking the missile program as a whole, and comparing their program with our own, I estimate that as of today our program is ahead of theirs.

Taking the long-range ballistic-missile program, apart from the missile program as a whole, I estimate that as of this time our program either is on a par with theirs, or that the differences are such that viewed, by and large and taking everything into account, one would find it very hard to say which program is ahead.

I think it is a neck-and-neck kind of situation, and one would need to define terms very accurately to state that one or the other is ahead.

This includes a lot of different factors, not only their program in the building and testing of rockets, which I may say they have shown great energy and skill in, but includes all of the other factors that go to make up the potency of long-range ballistic missiles in the balance of military power at the present time.

Mr. WEISL. Let us break the missile program up. How do you construe the strength of Russia in the intercontinental ballistic-missile field?

Mr. QUARLES. Mr. Counsel, I would like to say here, and then ask your indulgence to speak beyond that in a closed session—I would merely like to say here that in my estimate, and taking the intercontinental field, the intercontinental ballistic-missile field, and again considering it in its broadest context, after a very careful analysis of all the available information known to us about the programs of both sides, I would say that one could not with assurance state that either side is ahead at this time. Although I would like to add to that, as Secretary McElroy said, I feel that we should base our programs on the assumption that they are ahead, and that therefore we should take very seriously their position in this field.

THE OPINION IS HIS OWN

Mr. WEISL. Do the members of the Air Force, the Navy, and the Army agree with your estimate?

When I say "members," I mean the heads of the branches of the Army, the Air Force, and the Navy.

Mr. QUARLES. That is a very difficult thing to say. I think I was expressing what one might call a professional evaluation of my own, rather than the position of our Department. However, to the best of my knowledge, what I have said would be concurred in by the heads of the three service departments.

Mr. WEISL. What do you base that conclusion on, Mr. Quarles?

Mr. QUARLES. I base it on all available intelligence information and a very considerable amount of information about our own programs.

Mr. WEISL. What is our program in the intercontinental ballistic-missile field?

Mr. QUARLES. Our program is for the development of two intercontinental ballistic missiles of somewhat different configuration, and therefore of somewhat different time schedules.

I think if I might, I would like to reserve the rest of the answer to that question for a better occasion to discuss it fully.

Mr. WEISL. Would you like to also reserve the answer to the question of when these missiles will be ready?

Mr. QUARLES. I think I should, sir.

Mr. WEISL. Very well.

And is the same true with reference to the medium-range missiles? Would you rather discuss that in closed session?

Mr. QUARLES. Except to say, Mr. Counsel, if I might here, that we also have 2 programs of land-based intermediate-range missiles of nominal 1,500-nautical-mile range. Both of these programs have proceeded to an advanced stage of test and to a point where our scientific advisory people who study these programs have expressed the opinion that they are confident that both can be successfully completed. And, as the Secretary announced this afternoon, we have

accordingly determined within the last few days that both should be put into production, and we should proceed with deployment. And we believe we can do this with considerable confidence.

Mr. WEISL. And you would prefer to not state the dates?

Mr. QUARLES. If I may; yes.

Excuse me, I would remind the committee that we have announced this afternoon the plan to accomplish the first deployment of these by the end of the next calendar year. And I think that much of the date is appropriate to repeat here.

Mr. WEISL. Is that the completion of a prototype?

Mr. QUARLES. No, sir; that is the deployment of weapons in the field.

Mr. WEISL. And have we a prototype now ready?

Mr. QUARLES. I would prefer to answer that question in executive session.

Mr. WEISL. Very well.

What do you know about Russia's preparedness in that field?

Mr. QUARLES. I can say, sir, that the committee, I believe, heard Mr. Dulles and his people make a presentation on that subject. I think it is fair to say that I know the material that they presented to the committee. I think it would be better to discuss what that material is at another time.

Mr. WEISL. I take it you concur in their evaluation of that material?

Mr. QUARLES. I would have to be a little careful about that because I am not sure exactly what evaluation they gave you, so I think I would have to examine that a little more in detail, sir.

Mr. WEISL. Very well, sir.

Now, one of the complaints that has been made is the one relating to the complacency of the American people, the fact that they have not been aware of the strength of Russia, both scientifically, militarily, and technologically.

Some of the statements, Mr. Quarles, that you have made, and I am sure made in the best of faith, have contributed, I believe, many people believe, to that complacency. For instance, on November 11, you appeared on television, and in answer to a question, you stated—referring to the fields of military technology—and I quote:

I should say that you have to look hard to find fields in which they were definitely ahead of us, but I do agree that the earth satellite is one particular area.

Do you recall making that statement?

Mr. QUARLES. I do recall making that statement. I think that is a statement you might say out of context. There are a number of other things were said, but nevertheless I did make that statement, Mr. Counsel.

Mr. WEISL. Would we have to look very hard to find any fields in which they are ahead of us?

Mr. QUARLES. I would say that if you enumerated all of the possible fields, that you would have to search among them for the fields in which they are definitely ahead; yes, I would, sir.

THRUST OF RUSSIAN ROCKET ENGINE GREATER

Mr. WEISL. Are they ahead of us in the field of rocket engines with a thrust much stronger and more powerful than ours?

Mr. QUARLES. They have a rocket engine in my opinion that has a thrust, an individual rocket engine that has a thrust greater than the thrust of any of our rocket engines. But this again does not really speak to the problem, because the problem is how many of these rocket engines you associate in a missile and how well they work.

So, I think while the statement is true that they have one that is more powerful as an individual engine than any we have—at least we believe they have one, we credit them with having one—I think that one would be even there cautious about the statement that they were ahead of us in rocket engines.

Mr. WEISL. Would we not be safe in at least assuming that they might be ahead of us in that field?

Mr. QUARLES. We would be safer from the point of view of shaping our programs to make that assumption, I agree.

Mr. WEISL. Have we shaped our program on that assumption?

Mr. QUARLES. I would say we have, yes, Mr. Counsel. I would say that from the time that we undertook these high priority programs in this field, that we have shaped our program on that assumption.

Mr. WEISL. And you are taking into account what Senator Symington brought out in questioning Secretary McElroy with reference to overtime?

Mr. QUARLES. I am taking that into account. I recognize that that is a complicated history and one that it would be necessary to deal with rather carefully. But I am taking that into account in my answer, because the highest priority programs that are a response to the Russian development of very powerful rocket engines have, in my judgment, been rather carefully protected throughout this period. And I believe that is the testimony of the people that are running the programs, with some exceptions, some specific exceptions which we corrected as soon as we found them.

Mr. WEISL. Has research been an important part in the development of that program?

Mr. QUARLES. Research, sir, is a word that we must define. Of course, you might call the whole program research, or perhaps you refer to more basic research that underlies the programs, and I think, though, that I could answer the question; yes, research has been an important thing, however you define it.

Mr. WEISL. Congress, at the request of the Defense Department, appropriated \$1,700 million, I believe, for research, basic and applied, so that you must have considered it very important to get Congress to make that appropriation; is that not correct?

Mr. QUARLES. That is correct, Mr. Counsel; yes.

Mr. WEISL. And even though you say that the safest course to pursue was to assume that the Russians were pretty far along on an intercontinental ballistic missile, \$170 million was cut off the research program.

Mr. QUARLES. Mr. Counsel, I am glad you gave me an opportunity to straighten out that record, because that is not exactly correct.

Mr. WEISL. I want you to have every opportunity to straighten everything out, Mr. Quarles.

Mr. QUARLES. Thank you, very much.

Mr. WEISL. We are looking for the facts and nothing else.

Mr. QUARLES. I realize that, and I certainly appreciate it.

The facts in this case are that the Congress did appropriate something of the order of \$1,600 million, or maybe it was as much as \$1,700 million. I think that figure is a little large, but it is in that order, in the account that we call research and development.

In addition to the appropriations in that account, there are used for research and development funds available from other accounts of procurement, construction, and in minor degree from operation and maintenance accounts. And these additional funds bring the total of \$1.6 billion up to something in excess of \$5 billion.

Now, the only instruction that went out from the Defense Department did not deal with the appropriation for research and development. That was left intact and it was not withheld. Departments were, however, asked to decrease their activities in these other support areas by an amount equal to 10 percent of the, let us call it \$1.7 billion; so that, in effect, there was withdrawn from research and development activities in the development part of the job and not in the ballistic missile part of the job, there was withdrawn a total of something like \$170 million temporarily until the matter was studied and the departments showed cause for replacing it. And that restriction on the departments has now been withdrawn.

Mr. WEISL. Was the 10-percent cut in that field consistent with the feeling of urgency?

Mr. QUARLES. It would certainly not have been, had it not been applied discriminately.

Of course, it was assumed that the departments in withholding \$170 million would withhold it not from high-priority projects of the kind that you are speaking of.

However, when on careful analysis it appeared that it would affect not these ballistic-missile programs, but some others that we considered to be of such importance under present circumstances, as I say, the restrictive order was withdrawn.

Mr. WEISL. What other programs did it affect if it did not affect ballistic-missile programs?

Mr. QUARLES. It affected research and development programs in many other areas, and I cannot detail them because one would probably have to name 50 or 100 programs. I will be glad to supply that for the record, Mr. Counsel. I cannot name them. If you will excuse me, they did not affect our highest priority programs.

Mr. WEISL. Did they affect the satellite program?

Mr. QUARLES. They did not; no, sir.

Mr. WEISL. Did they affect the airplane program, the bomber program?

Mr. QUARLES. I am sure that they did affect some of the airplane programs. I cannot be more explicit than that. They did not affect the bomber programs, the B-52 program and the tanker for the B-52 program, were unaffected by these changes.

Mr. WEISL. What programs were affected?

Mr. QUARLES. I will have to supply that for the record, sir. I cannot answer that offhand.

Mr. WEISL. You heard the thorough examination of Secretary McElroy by Senator Symington in connection with the cutback of the production of B-52's; did you not?

Mr. QUARLES. I did hear the discussion; yes, sir.

Mr. WEISL. Did you consider that cutback consistent with any feeling of urgency and an assumption that Russia had strong capabilities in the ballistic field?

Mr. CHARLES. I would like to straighten out that record, too, Mr. Counsel.

Mr. WEISL. Please do.

(The Department of Defense memorandum on programs affected by the decrease of activities supporting research and development is as follows:)

STATEMENT FOR THE RECORD FOR THE SENATE PREPAREDNESS INVESTIGATING
SUBCOMMITTEE

The impact upon Department of Defense programs caused by implementation of the August 17, 1957, memorandum from the Secretary of Defense can be considered only in the full context of the "research, development, test, and evaluation" program. Within this broader program, the research and development appropriations, as such, represent only one of several major elements. The entire scope of the "research, development, test, and evaluation" program is indicated in the statement which appears on page 1921 of the hearings on the fiscal year 1958 Department of Defense appropriations before the DOD Subcommittee of the Committee on Appropriations, House of Representatives (a copy of which is attached). These data indicate the necessity of adequate and well-balanced support from other appropriations to pursue effectively programs financed under research and development appropriations.

In the early fall of 1957, steps were being taken to effect reasonable control of Defense Department expenditures. Consequently, all programs were carefully reviewed, and procurement and production was one area in which some adjustment seemed feasible. The need for devoting adequate effort toward procurement of modern end items to equip the operating forces required that some effort also be directed toward reducing the amount of funds devoted to the support of research and development provided from procurement and production appropriations. As a part of this overall review effort, it seemed necessary to make sure that a balance would be maintained between the effort to be funded from research and development appropriations and the related funds provided from procurement and production appropriations. In this broad concept, the memorandum of August 17, 1957, was issued, and it provided as follows:

"In connection with various steps now being taken to review programs and to make changes required to meet expenditure objectives, available research and development funds may be fully utilized but at the same time a reduction will be made in the amounts utilized for this purpose from the procurement and production appropriation. The support of development, test, and evaluation provided from procurement and production appropriations must be kept to a minimum so that maximum funds may be utilized for materiel requirements of the operating forces.

"To accomplish this objective and at the same time to continue a balanced research and development program including adequate support of the type previously planned for funding under procurement and production appropriations makes necessary revisions in the programs presently planned for funding under both research and development and procurement and production appropriations. These programs will therefore be adjusted to the extent necessary to reduce support requirements under procurement and production appropriations by a total amount not less than 10 percent of the fiscal year 1958 research and development appropriation for each department, and such requirements will then be funded under research and development appropriations.

"Revised project listing for research and development appropriations will be submitted which will show separately the items transferred."

The implementation of the instructions contained in the August 17, 1957, memorandum was still under review by the military departments, and revised programs had not yet been submitted for review by the Secretary of Defense on October 28, 1957, when the August 17, 1957, memorandum was rescinded. It is therefore not possible to state categorically which programs were actually delayed as a result of the August 17, 1957, memorandum.

It must be recognized that during this period the military departments were required to take steps to stay within established expenditure ceilings and also that the Department of Defense started fiscal year 1958 operations under a

continuing resolution, because of late appropriations and apportionment actions, which required extensive control of the rate of obligations of anticipated fiscal year 1958 funds, as well as unobligated balances of prior year funds. These actions, which affected all programs, as well as the August 17, 1957, memorandum had an influence on research and development and related programs, some of which were curtailed. It is, however, not practicable to distinguish clearly the impact of the August 17, 1957, memorandum as distinct from the impact of the other circumstances noted above, since the 10 percent of research and development funds placed in reserve for each military department as a result of the memorandum did not, in general, involve withholdings on specific projects.

With full recognition of these circumstances, the following information is furnished with respect to the actions taken by the military departments in response to the August 17, 1957, memorandum:

ARMY

The Army conducted a detailed reexamination of its entire research and development program to determine the extent to which compliance with the Secretary's memorandum would necessitate reorientation of the program and concurrently made a strong reclama to the Secretary of Defense. Although the memorandum was rescinded before its terms were implemented, some delay was experienced in the initiation of a number of research and development programs.

NAVY

The Navy decided to continue the research and development programs as originally planned and to apply the reduction to the procurement and production support program. This proposal had been submitted to OSD but not yet approved at the time the August 17, 1957, memorandum was rescinded. Thus, the net effect on the program supported by research and development funds was nil; but there was a slight delay in initiating certain items supported by the procurement and production appropriations.

AIR FORCE

Prior to the August 17 memorandum, the Air Force decided to apply a reduction to obligations planned for its research and development programs to effect a net 5 percent reduction in spending rate as a part of the requirement to control expenditures within the overall expenditure ceiling assigned to the Air Force. The August 17, 1957, memorandum appears to have had no specific effect on Air Force research and development programs beyond that already resulting from the Air Force efforts to control expenditures and the review of obligations made necessary by the continuing resolution.

PROGRAM FOR CUTBACK CAREFULLY EXPLAINED

Mr. QUARLES. The program on B-52 production today is exactly the program that we presented to the Congress last summer. There has been no cutback in it. The program on KC-135 tankers today, which is the main support item for the Strategic Air Force, is the same program that we presented to the Congress in support of the budget last summer.

I think that I am correct in saying that while there was such a change, the change was thoroughly explained at that time, and so far as I know, was disagreed with by no member of the Congress to whom we presented the program. To be more explicit—

Senator SYMINGTON. Will counsel yield to me there for a comment?

Mr. QUARLES. If I might, please, sir, finish my response—the change from 20 per month for the B-52's to 15 a month was not a cutback in production but a change in future plans for production. What we did was to conclude, on careful study of the problem, that it would be wise to hold production at 15 a month, which we reached last June, rather than having it carry on to 20 a month which we would have reached at about the present moment in our schedule.

And the reasons for that change were explained in great detail to both the House and Senate committees interested, and in brief they were that by doing so, we could get a substantially greater proportion of an improved model plane and the final time of equipping our 11 heavy wings was not seriously affected. But what we all, I think, agreed at that time was that this was a wise program, and it is the way the program was left with the Congress at that time.

Mr. WEISL. I will yield to Senator Symington if you do not take too much time, because there are so many questions I would like to ask the Secretary.

Senator SYMINGTON. I thank the counsel and I will take a very short time. I checked very carefully the record, and I was taking about the beginning of the year, not about last summer, and unless the people who are producing the airplane have given me misstatements of fact, the statements that the Deputy Secretary of Defense has made are incorrect, and I would ask the counsel's permission and the committee's to put the facts in as were given to me within the last 7 days, giving the statement that the slowdown, the stretchouts of the B-52 program that originated in 1957 have not been restored, and that the reason given was fiscal—money, budgetary problems.

I thank the counsel.

Senator CASE. Mr. Counsel, reserving the right to object, and I am not going to object—I merely want to ask that Mr. Quarles may have an opportunity to comment upon the statement.

Senator STENNIS. Gentlemen, can we proceed in regular order here.

Senator CASE. Unanimous consent is asked, to suggest, that is, regular order, the suggestion if that is to be inserted, Mr. Quarles have the opportunity to comment upon the insertion.

Senator STENNIS. Without objection, it is so ordered.

Mr. QUARLES. May I do so now, Mr. Chairman?

Senator STENNIS. You do not have it ready now?

Mr. QUARLES. Yes, sir, I do; yes, sir.

Senator STENNIS. Proceed.

Mr. WEISL. Would you like to comment on that statement made by Senator Symington?

Mr. QUARLES. I would like to comment, sir, to say the statements I originally made are, to the best of my knowledge and belief, completely factual statements. I think the Senator himself will remember our discussion of precisely these points and precisely these numbers last summer when the budget was under discussion, and I think the record of the discussion at that time will show that what I have said today is precisely correct.

Mr. WEISL. Mr. Quarles, did you advise the Senate committees of the progress being made by Russia in the ballistic-missile field at that time?

Mr. QUARLES. We did, sir. We had discussions with, I think, all of the committee about the progress of the Russian ballistic-missile program.

Mr. WEISL. I believe Senator Symington in his statement was referring to the beginning of 1957, not the summer.

Mr. QUARLES. Mr. Counsel, I said nothing about Senator Symington's remarks. I answered your question and stated what I had stated to the Congress last summer in support of the program.

Mr. WEISL. Was there any cutback in the number of tanks being produced for the Army?

Mr. QUARLES. I will have to answer that question for the record, Mr. Counsel. I do not know the answer offhand.

Mr. WEISL. Was there any cutback in the number of submarines being produced for the Navy?

Mr. QUARLES. Subject to correction in the record, I would say that I know of none, but I am not sure of the answer to that.

(The Department of Defense memorandum on tank production and submarine construction is as follows:)

MEMORANDUM

TANKS

The programmed annual rate of production for M48A2 tanks remains unchanged at 900 (75 per month). However, there has been a gap in production of 5 months in 1957 after completion in July of the ALCO Products contract. Award of the fiscal year 1957 quantity of 900 tanks to Chrysler Corp. was made on May 31, 1957, and production at Chrysler is to commence in January 1958 and is scheduled for a year at the rate of 75 per month.

SUBMARINES

The award of 2 of the 3 guided missile nuclear submarines in the fiscal year 1958 program has been deferred by the Navy Department until fiscal year 1959. No delay in completion is expected to result from this deferral of award, however. This is so because completion of contract design will occur late in the 1958 fiscal year (May) and working plans for actual construction begin to become available from the lead yard several months later. In the meantime the longer lead time material items are being procured for all 3 submarines. There have been no directed changes in private shipyard construction programs. In Government-owned shipyards, there has been some stretchout in estimated delivery dates.

WE ARE AHEAD IN ELECTRONICS IN GENERAL

Mr. WEISL. Turning again, if I may, Mr. Quarles, to statements that have recently been made by you, not to deny their accuracy but merely to test the basis on which you made them, I call your attention to the following statement which you made over television about 2 weeks ago.

In discussing the capabilities of Russia as compared to ourselves, you stated, and I quote:

I feel we are ahead in electronics. I feel we are ahead in atomic weaponry. I feel we are ahead in many branches of aviation, but I do not include the particular area of earth satellites which isn't, incidentally, a military area.

Is that a correct quotation?

Mr. QUARLES. I think it is substantially so; yes, sir.

Mr. WEISL. In what electronics field relating to ballistic missiles are we ahead of Russia?

Mr. QUARLES. Well, if you pin the electronics area down to ballistic missiles, I would feel I had to discuss that in closed session, Mr. Counsel.

Mr. WEISL. Is that not what was being discussed on that program?

Mr. QUARLES. I think if you take it in context, sir, you will find that it was not being discussed. I was talking about these areas of technology across the board. I was not talking about electronics and ballistic missiles. That would be certainly not a matter to single out for discussion.

Mr. WEISL. The program was started, Mr. Quarles, and I merely am trying to quote it correctly:

Recent successes in rockets and missile development by the Soviet Union have resulted in serious criticism both at home and abroad of our scientific progress in that field.

Would you not say that that was a discussion of ballistic missiles?

Mr. QUARLES. I would certainly say that was; yes, sir.

Mr. WEISL. And it was in that connection that you were questioned about our progress, and you stated—and if I am quoting incorrectly or giving the wrong impression, I would be happy if you would correct me—you said we were ahead in electronics, and I am asking just for the information of the committee where in electronics were we ahead as far as the ballistic-missile program is concerned?

Mr. QUARLES. I have to say that my remarks had nothing to do with electronics in the ballistic-missile program, and I could not have answered that question in public had they asked me. We were talking about technology across the board at the time.

Mr. WEISL. In what field of technology relating to military weapons are we ahead of Russia in electronics?

Mr. QUARLES. I would say that taking it as a whole, we are ahead of Russia today in military electronics, taking it as a whole and not without some exceptions.

Mr. WEISL. In what field? I mean in what specific field?

Mr. QUARLES. I think I would prefer to go into that in executive session.

Mr. WEISL. Very well. And you stated that we were head in atomic weaponry. What did you mean by that, Mr. Quarles?

Mr. QUARLES. Well, I meant just what the words say, that I felt that our whole atomic-weapon position as of this moment is a stronger position than theirs.

Mr. WEISL. In what respect?

Mr. QUARLES. I will be glad, if I may, sir, to discuss that in executive session.

Mr. WEISL. You want to do that in closed session. Then you stated that we were ahead in many branches of aviation. Did you mean military aviation or civil aviation?

Mr. QUARLES. I was speaking of military aviation, although I do not think I would have needed to pin the thing down precisely. I would still make it as a statement, and I think that we in this context should probably discuss it as military aviation.

Mr. WEISL. Can you say without violating security in what field of military aviation we are ahead of the Russians?

Mr. QUARLES. I can say, and again would ask your permission to amplify it under other circumstances, I would say that as of this time, in my opinion, we have the qualitative lead on the Russians in military aviation.

Mr. WEISL. In what?

Mr. QUARLES. In military aviation. And I am not breaking it down by types at this time, if I may, sir, and I should say, too, that I am not claiming qualitative superiority in each field of military aviation. I am taking an across-the-board appraisal as well as I can make it.

Mr. WEISL. The Russians have made great advances in jet engines, have they not?

Mr. QUARLES. They certainly have; yes, sir.

Mr. WEISL. Do they have jet engines of greater power than ours?

Mr. QUARLES. They have jet engines, individual jet engines, that have greater thrust than any standard engines that we have; yes, sir. This, however, deals merely with one characteristic of the engine, namely, its thrust, and does not by any means speak to the overall quality of the engine.

Mr. WEISL. May I ask, Mr. Quarles, whether in 1956 at the air-power hearings you testified that the Soviets had more combat planes than we?

Mr. QUARLES. I think, Mr. Counsel, that that record was finally straightened out to this general effect; that of advanced jet aircraft in combat units, they do have more. Of such aircraft in inventory, they do not have more. One has to be very precise in the way this question is asked in order to be sure that you are not misleading in the answer, and I believe that the record at that time was finally straightened out to distinguish between combat units in inventory and to distinguish between one air force versus the other, for example, and our total national position versus theirs and our total free world position versus theirs.

But it is true that if you state the question narrowly, you have to answer it that they have more modern jet aircraft in combat units than we have in the United States.

Mr. WEISL. May I read from the record, Mr. Quarles?

Mr. QUARLES. I would appreciate it if you would.

Mr. WEISL (reading):

The Communists are producing far more combat airplanes than we are.

This was in the summer of 1956.

Mr. QUARLES. You are speaking now, sir, about their rate of production, and I thought you were speaking——

Mr. WEISL. No. I am quoting the record of the hearings before the Subcommittee on the Air Force, page 1549. Now, maybe the report is wrong. But I am reading correctly from it.

Mr. QUARLES. Yes, sir. I submit that the words you read, which are undoubtedly my words, dealt with the rate of production and not the number of aircraft either in inventory or in combat units. That is the distinction, Mr. Counsel.

Mr. WEISL. And then you further state: "Even more important, if being ahead is related to the rate of progress"——

Mr. QUARLES. Are you sure you are quoting me, Mr. Counsel?

Mr. WEISL. I understand that this is your corrected record.

Mr. QUARLES. It sounds to me very much like General Twining's testimony at that time. However, I must say that aside from emphasis, I would agree with the testimony.

Mr. WEISL. There was another statement made in that record with which I understand you agreed. If you did not, why certainly you can say so: "One of the reasons that we are dropping behind is that the Communists are making scientific and technological advances at a faster rate than we are."

Mr. QUARLES. General White said that, and in specific context I agree.

JUSTIFICATION OF HIS POSITION

Mr. WEISL. You said that in 1956, and yet in this public television appearance, you gave the impression that we would have to search pretty far afield to find any technological field in which the Soviets were ahead of us.

Mr. QUARLES. I think these statements in context are not inconsistent, Mr. Counsel. One deals with their rate of progress. The other deals with their static position.

Mr. WEISL. Is not a combat plane a technological feat?

Mr. QUARLES. I can only answer that "Yes," but I do not quite see where that question leaves us, because it is not the type of progress that I was referring to.

Mr. WEISL. The only reason, Mr. Quarles, I am asking these questions is to illustrate why the public might have been led to a feeling of complacency when in November of this year, after sputnik was placed in orbit, a half-ton object, a half-ton satellite projected in orbit, you said that we would have to "look hard to find fields in which they were definitely ahead of us," except, you stated "in certain satellite areas," and then you said that we were ahead of them in electronics, in atomic weaponry, in many branches of aviation.

Mr. QUARLES. I submit, sir, that none of the fields that I mentioned as being ahead of them had anything to do with the fields they employed in launching their satellites. And I admitted frankly, that they had established a clear superiority to us in relation to satellites. I do not again find any inconsistency in those phrases.

Mr. WEISL. And again on November 18, Mr. Quarles—that is the trouble when we make public speeches—

Mr. QUARLES. It is, indeed.

Mr. WEISL. You stated in a speech to the Wings Club, that was November 18, about a week ago, that you found no cause for alarm "in the existence of the Russian satellite," and that "it is imperative that we not be sidetracked from our prime security objectives by extraneous or irrelevant issues."

Do you believe that Sputnik I and II are extraneous and irrelevant issues to the security of the United States?

Mr. QUARLES. No, I do not, and I do not think if you read my whole remarks at that time you would so construe them.

I do believe, however, that to respond to Sputnik I and II by a lot of the kinds of projects that have been proposed as a response would be, at least some of them would be, extraneous to and for that reason perhaps harmful to our more essential programs.

Mr. WEISL. Do you not think—and I may be wrong, it is just a question of opinion—it would have been better to arouse the people to a sense of urgency rather than to give them a feeling of complacency?

Mr. QUARLES. Mr. Counsel, I would appreciate it if you would put my whole speech in the record, because if my speech had any purpose whatever, it was to arouse, and I think it is fair to say that it did do so.

Mr. WEISL. You did say this in that same speech, and I quote, referring to the satellites or to the Russian sputniks:

They are a significant technical achievement, significant in themselves and significant as an indication of the state of advancement of their military rocketry. It is no disparagement then to say that they have little or no other military

significance. They do not prove that the Russians are more advanced in military rocketry than we are. Even if they did, this would be a minor rather than a major factor in the near-term balance of military power.

Mr. QUARLES. Those words were all said with great deliberation and I stand by every one of them.

Mr. WEISL. I am sure you do, and I am sure you were sincere and made them in the best of spirit. But doesn't that give the listener a feeling, well things are not so bad, these things are up in orbit but they have very little significance?

Mr. QUARLES. I think if you took the sentence that you quoted out of my speech and made a speech of those sentences only, you might very well have left that impression.

Mr. WEISL. I read the speech. I do not want to read the whole speech now, but I did read the speech, Mr. Quarles, and I discussed it with my associates and discussed it with others who heard the speech, and they all felt that while you were entirely sincere, it did give a feeling of complacency to the listener.

In other words, they said: "Well, these things did happen, they did put a half-ton satellite in orbit, but it has little significance as far as our overall military protection is concerned."

Mr. QUARLES. We have to stand on our professional judgment in matters of this kind, Mr. Counsel, and I stand on mine. I think that a great many people around the world are anxious to have a fair appraisal of this situation, and I think, that as I attempted to make clear before we started, that it is very important to leave this in a correct and balanced place rather than creating impressions.

Mr. WEISL. That is what I feel we ought to do: that it ought to be in the right balance today but certainly all of us here, I know that the members of the committee, after hearing the evidence that we have heard, are tremendously aroused over the potential threat.

HE IS AROUSED, ASSERTS QUARLES

Mr. QUARLES. I doubt that any member of the committee is any more aroused about the threat than I am, Mr. Counsel.

Mr. WEISL. And we feel that the public must be aroused in order to understand the danger that exists, so that they will make the sacrifices that are necessary to meet that danger. And you are aroused, I am sure, Mr. Quarles, or are you aroused?

Mr. QUARLES. I have just stated that I was at least as aroused as any member of the committee, Mr. Counsel, so I guess that is an answer to your question.

Mr. WEISL. I can assure you that the committee is——

Mr. QUARLES. Pretty aroused.

Mr. WEISL. Very aroused. It is determined to get every fact that is material and try to do something about it. I do not want to belabor these statements, Mr. Quarles, and I will not read all of them. I will just read another one.

On September 9, 1957, you addressed the United States Conference of Mayors in New York. That was when the Soviets announced that they had made a successful test of an ICBM. You were quoted as having said, and I quote:

It is my feeling that the military significance of this particular phase of the competition has been exaggerated

Mr. QUARLES. That is one of the sentences in my speech in New York. I agree, sir.

Mr. WEISL. Do you think that that gave the people or the mayors who listened to this a sense of urgency about the situation?

Mr. QUARLES. That sentence taken apart from the rest of the speech would undoubtedly not have given them that sense; no.

Mr. WEISL. What was there in the rest of the speech?

Mr. QUARLES. Well, I guess the speech has to stand on its own record. I think you will find that the speech had no quality of complacency, if you take it in its entirety.

Mr. WEISL. It just seems to me that if a man of your position in Government and your ability as a scientist and a technologist, states to the mayors of this country that it is your feeling that the military significance of an ICBM test by Russia has very little military significance, or that it is exaggerated, that does give a feeling of complacency.

Mr. QUARLES. I am sure you did not mean to put in the "very little" significance.

Mr. WEISL. No, no. I will quote it exactly:

It is my feeling that the military significance of this particular phase of the competition has been exaggerated.

How can you exaggerate the military significance of a test by Russia of an intercontinental ballistic missile?

Mr. QUARLES. You can exaggerate it by failing at the time to take account of all of the other factors that do tend to make such a test as of this time relatively less important than it was being represented to be.

The other factors I have reference to are our very great manned aircraft striking power at that time, and the fact that such a test, and what we know about it, does not entitle one to believe that they have, either had at that time or will have in the near future, a striking power based on this kind of development.

I do, however, submit that I made it very clear that in this speech, as in every other one I have made, that the important thing to note was the rate at which they had moved forward, and that this was a challenge to us that was very important for us to meet.

Mr. WEISL. You stated, and I know you are sincere, that you are aroused and have been aroused at the danger.

Mr. QUARLES. That is correct, yes.

Mr. WEISL. Do you think that these quotations of yours that I have read would have a tendency to arouse the Nation to the danger?

SPEECHES EMPHASIZED CHALLENGE, SAYS QUARLES

Mr. QUARLES. I think the particular sentences you have quoted do not have that tendency. I still feel that the speeches had the quality that I have described of emphasizing the challenge to us and the danger looking down the road, the great importance of our maintaining the strongest kind of a military program applied to the highest priority need.

Mr. WEISL. But did we do that? Did we not make cuts in our military program during this period?

Mr. QUARLES. We have made cuts, certainly, in our military programs. We have not made cuts in the high-priority programs that

I referred to except in respect to the rate of production of such programs which were judged not to be important because it was judged by technical people that we were not ready for the production at that time.

Senator JOHNSON. Counsel, will you yield there?

Mr. WEISL. I will yield.

Senator JOHNSON. Mr. Quarles says that he is aroused, and he says that your quotation of selected sentences from his speech may not indicate in those sentences that he was aroused, but implies that there are other portions of the speech that were said and were calculated to arouse the country.

I wonder if Mr. Quarles would point out the paragraphs in the speech or the sentences in the speech which he feels were calculated to arouse his fellow Americans to the same extent that this committee is aroused. We will supply him with a copy of it and let him point out the parts of it that support his position.

Mr. QUARLES. I would be delighted to do that now, Mr. Chairman, or I will be delighted to do it for the record, since it would take a little time to do it.

Which would be your preference?

Senator JOHNSON. We will just submit it to you now.

Mr. WEISL. This is your speech at the Wings Club, and this is your speech to the mayors. And this is your television program of this November, 2 weeks ago.

Mr. QUARLES. Mr. Chairman and members of the committee, I read from my Wings Club speech, beginning on page 9 of the transcript for it or the record of it. I will read two paragraphs:

Perhaps the significant point here is that a nation with only a fraction of the industrial strength and resources of our own can, with its ruthless dictatorial system of government, make impressive progress along the lines in which they choose to concentrate their efforts.

We can deplore the sacrifices their people are called on to make, but we must not fail to meet the competitive challenge. It will be costly and call for sacrifices on our part in the form of personal effort on the part of some and greater tax burdens than we like to bear on the part of all. If we are at times annoyed by the sacrifices we must make, we have grounds for hope that those under the Communist yoke will become outraged by theirs. Our course seems clear to me. We must do whatever it takes to meet this situation. We must recognize our community of interest with our free world friends and allies. We must collectively with them maintain adequate deterrent forces in instant readiness. We must plan our own programs for the long pull, so that military superiority will not be undermined by economic insecurity. We must strengthen our foundations in the field of scientific and technical training and in basic research, and specifically we must broaden and deepen our programs for the exploration of outer space. We have the capacity to meet this challenge and still enjoy the highest standard of living that any people have ever enjoyed. My belief is that we would want to meet the challenge even if the standard of living had to suffer.

Shall I quote any of the other speeches, Mr. Chairman?

Senator JOHNSON. Yes; I would like you to quote everything that in your opinion supports your position that those speeches were calculated to arouse your fellow Americans, because that is your position, and as I understand it, your testimony is that you are aroused as any member of this committee and that what you were saying was calculated to arouse others.

And I want to, in fairness to you, have you substantiate by quotation what you have contended in your oral testimony, by referring to any statements you made urging a speedup of action or an

acceleration of progress or a stepped up program, once it was determined that we were coming out second best.

Mr. QUARLES. Of course, with a little more time, one could perhaps do a better job.

Senator JOHNSON. I assume you are familiar with your own speeches.

Mr. QUARLES. That is very true, Mr. Chairman, but I am not familiar with picking out sentences at a time.

Senator JOHNSON. You take such time as you may need. We are not going to rush you.

The whole point in asking you to do this, is that counsel has made his point and I want you to make yours, and then let the committee and the country judge.

Mr. QUARLES. I certainly appreciate it, Mr. Chairman.

Senator JOHNSON. There is a great feeling, I think, in the committee and in the country, that there has been nobody in a real hurry about this whole situation and there has been a lot of public officials who have been making statements which are calculated to laugh the whole thing off.

And if it has been your feeling that the people should be aroused to greater effort, to greater expenditures, to an acceleration of the program, to a speedup of the whole thing, if you have said anything to justify that position, I want it in the record so that he who reads can judge.

Mr. QUARLES. Thank you, sir. I certainly appreciate the opportunity.

In the Mayors Association speech, which was referred to, some considerable part of the speech was devoted to the programs of the cities which the mayor represented, and our appreciation for the fine cooperation we had from the mayors of the cities, so it is not really pertinent to the question to which we are speaking.

Senator JOHNSON. We make speeches to various organizations, and I am sure we appreciate that part of your speech.

Mr. QUARLES. I come to one place in the Mayors Association speech which is found in the middle of page 4, which says:

All of these things

and I had been referring to the announcement of the intercontinental missile test in Russia, the armament talks in London, the recent world events, particularly in the Middle East, the Defense budget requests and the congressional action thereon, the lively discussion in Congress and the press of our military assistance program—

All of these things have an important bearing on the problem of national defense. Pervading it all and in fact dominating some aspects of it is the phenomenal advance in science and technology as applied to the art of war, an advance that has had a truly revolutionary impact.

We don't have time here today to go very deeply into the foundations of this situation. Suffice it to say that the U. S. S. R. from a well behind start after World War II has pulled up into a challenging position.

We are no longer alone in having the ready capability of inflicting terrible damage on the enemy. We now must reckon with a similar, although not necessarily equal, U. S. S. R. capability.

For a decade or so after World War II, peace in the world rested primarily on the foundation of our retaliatory capability and our will not to use it unless attacked. From now on, peace must depend also on the will of a Communist power not to use its growing air atomic capability.

Without drawing any conclusions about the present peaceful intent or otherwise of this Communist power, it is my conviction, and I hope it is yours, that under such circumstances until there is something to take its place, our national security requires us to maintain a defensive retaliatory position that will at any point of time make it clearly unprofitable for the Communists to resort to aggression against us.

Intent, no matter how good, is too ephemeral a thing to rely on.

I think there are various other quotations, and unless you urge it, I would like to just say—

Senator JOHNSON. If that is your idea of a speech that is calculated to arouse people, that is calculated to spur them to expedite the existing program, to chart new courses, to outline new goals, to regain a superiority that has been lost, and you think you have got them whipped up into that state of mind by those speeches, then your evaluation of the effect of the speech is different from mine.

I think what you are saying may all very well be true. Nobody has any disagreement with it, but the net of it is, the American people can have adequate defense and eat their cake, too. They can maintain the high cost of living and eat their cake and have a little cream on it.

That is not my idea of the story that they ought to be told when things develop as they have developed in the last 2 months.

YOUNG PEOPLE ASKED PENETRATING QUESTIONS

Mr. WEISL. The Secretary did say, Mr. Chairman, in his speech at the Wings Club, that the standard of living might have to be affected to meet the challenge.

Now, in your speech to the young people over television, about 2 weeks ago, will you please point to something that you said in that little interview there in answering questions that it would arouse young people, the television audience, to a sense of urgency?

Mr. QUARLES. Well, as you well know, Mr. Counsel, in these television programs, you answer the questions you are asked and you try to make the point as well as you can.

Mr. WEISL. Yes, sir. I wish I could ask the questions as well as those youngsters asked the questions—

Mr. QUARLES. I agree with you, sir.

Mr. WEISL (continuing). On that program.

Mr. QUARLES. On the other hand, it leaves you feeling, at the end of the half hour, that you wish very much they had asked you some questions that they didn't ask that would have made it possible to make your point.

Mr. WEISL. But they did ask, Mr. Quarles, some very pertinent questions.

Mr. QUARLES. I agree they did.

Mr. WEISL. They asked you specifically what were we doing about Russia's threat, were we ahead or was Russia ahead of us. You said they were not ahead of us. They asked you whether they had a ballistic missile; how we stood, with reference to technology; how we stood with reference to science.

And at least you gave me the impression—I heard the interview, and I read the interview afterward—that the satellite did not really mean very much, just to show they might have had a little rocket engine that was strong; and that we were ahead of them in atomic weaponry, in aviation, in electronics.

If you wish to—now, certainly I do not want to belabor the point, Mr. Quarles, and I am sure the committee wants to be completely fair. We have been criticized, Congress has been criticized, for not arousing the people. Everytime I meet someone, they say, “Well, my God, we never knew about this.”

Senator JOHNSON. I should like to observe that I think the words in the speeches you quoted could be considered in the context of the official acts of cutting the military suit to fit the budget cloth.

THE BUDGET DID NOT COME FIRST, SAYS QUARLES

Mr. QUARLES. I believe you will find that no speech I have ever made has advocated that we cut our military suit to fit the budget cloth. That is not my belief. I have appeared many times before Congress and before the public on this matter, and I think the record will show that I have never on any occasion advocated that position, either before the Congress or the public.

Senator JOHNSON. And you believe that has not been the policy of the Department during the time you have been there?

Mr. QUARLES. I believe it has not been the policy of the Department. But that is a different question, Mr. Chairman, I think you will agree. I was speaking to my own responses.

Senator JOHNSON. Then the budget ceilings have had no such effect, in your opinion?

Mr. QUARLES. The budget ceilings, to the extent that there have been budget ceilings—and I think that word perhaps implies more than it should—but at any rate, I certainly agree that there have been fiscal limitations which have limited our programs. I do not agree that the programs were limited solely because of fiscal limitations. In other words, I believe there was an honest effort made to produce a sound defense, and certainly as far as I was concerned, that was the first requirement of the program.

Mr. WEISL. Were you surprised when the sputnik was launched?

Mr. QUARLES. No; I was not particularly surprised, Mr. Counsel. I was surprised at the particular day, but I was not surprised that the sputnik was launched.

Mr. WEISL. Were you surprised that it was launched ahead of ours?

Mr. QUARLES. That depends on the timing of your question, Mr. Counsel. At the time it was launched and within, let us say, weeks before that, I was well aware of the fact that ours could not be launched in this period, and I was quite conscious of the fact that theirs might well be launched.

Mr. WEISL. Do you think it was important that we launch ours ahead of theirs?

Mr. QUARLES. Yes, I do, Mr. Counsel.

Mr. WEISL. It was pointed out, Mr. Quarles, by a very important commission headed by a very prominent gentleman, that it was most important—

Mr. QUARLES. Well, I am not—

Mr. WEISL (continuing). To launch our satellite first.

Mr. QUARLES. I am not disagreeing with that, Mr. Counsel.

WE DID NOT START EARLY ENOUGH ON SATELLITES

Mr. WEISL. Could we have launched a satellite ahead of the Russians?

Mr. QUARLES. Had we started early enough, I think there is no doubt we could have.

Mr. WEISL. Didn't Dr. von Braun publicly state that he could have launched a satellite 6 months ahead of the Russians, but was stopped?

Mr. QUARLES. I am sure that he made such a statement, although I cannot quote it accurately. I agree with your statement.

Mr. WEISL. If he was stopped, who stopped him?

Mr. QUARLES. That is a question that one would have to answer carefully, because this is a matter of a number of years.

When he first made the suggestion immediately or a short time after World War II, I presume that he was stopped by the people who had power to stop him at that time.

When he made the suggestion in 1954, when we were first considering the scientific satellite program, he was not authorized to proceed with his satellite on advice of the best people we could get hold of to render advice at that time, because, in their judgment, there was more promise in an alternative way of doing the job.

More recently, he has again——

Mr. WEISL. I beg your pardon for interrupting you, Mr. Quarles.

Mr. QUARLES. Surely.

Mr. WEISL. But what was the alternative way of doing the job? I mean, does it make any difference how a satellite is launched in orbit, so long as it is launched?

Mr. QUARLES. Well, yes, I would say it makes a difference, although again I am not quite sure I am being responsive to your question there. I think the best I can do is to describe to you briefly the considerations at the time the Orbiter proposal of the Army and Navy together, in which Dr. von Braun and his people at Redstone were interested, was turned down in favor of the Navy program that has since come to be known as Vanguard.

This was on the basis of a very detailed study by the best scientists and technical people we could get, and it was their recommendation that we follow the Vanguard course as the more promising technical course.

WHY DID THEY DRAG THEIR FEET ON SATELLITE?

Mr. WEISL. Well now, Mr. Quarles, one of the leading committees headed by one of our leading scientists, appointed by the President, in their report stated that it was most important for us to launch our satellite ahead of the Russians. Admiral Bennett, Rear Admiral Bennett, of the Office of Naval Research stated that the Russian satellite should not have been a surprise, because the Russian magazine Radio announced that the launching was imminent in its June issue, even giving the frequencies to be used.

Now, if Admiral Bennett had a feeling—and he was the head of the Office of Naval Research—after reading this magazine that a Russian sputnik was to be launched sometime after June, that it was imminent, and we were apprised by one of our leading independent committees, appointed by the President, that it was most important to launch ours first, because of the psychological effect it would have throughout

the world and on our allies, why did we not let Von Braun launch it, or at least why did we not give Dr. Hagen priority when he asked for it?

Mr. QUARLES. Well, there are a lot of questions mixed up there, Mr. Counsel.

Mr. WEISL. Well, let us straighten them out.

Mr. QUARLES. The committee that you refer to made its report early in 1955. At that time the report was an endorsement of the scientific satellite program, and an urge, as you state, to move on with the program and get our satellite up before the Russians put theirs up.

So I take no exception to that. I can only say that as of that time, the best scientific advice we had was to the effect that that was our preferred course of action to get a satellite up. This was early in 1955.

Your next statement, sir, was that in the summer of 1957, Admiral Bennett, who was in charge of the Vanguard program, said that he knew from Russian publications that they hoped to get their satellite up early, and that it would have such-and-such frequencies.

That is true, and was, in fact, one of the things I had in mind when I said I was not particularly surprised about the result.

As of that time, there was no possible way that we could have proceeded, starting then, with any other course of action that would have been more favorable than the one we were on. So I do not see any inconsistency here, other than the fact that as we now look back on it all, we can see ways in which we all wish we had acted somewhat differently.

Mr. WEISL. I am not looking, and I am sure the committee is not looking, for inconsistencies. But certainly if an important committee, headed by one of our leading scientists, is appointed to look into this matter, and they say and they recommend that it is most important to get a satellite up ahead of the Russians, and if we could have gotten it up, as von Braun says, in 1956—von Braun says he was turned down twice in 1956, after we had a warning that the Russians were to put this satellite up.

Mr. QUARLES. I think, Mr. Counsel, that the sequence of events—

Mr. WEISL. I beg your pardon, sir?

Mr. QUARLES. I think the sequence of events was not quite as you have given them, because the warning of the Russian satellite and the timing of it were 1957 warnings and not 1956 warnings.

DEFENSE OF DECISION TO GIVE MISSILES PRIORITY

Mr. WEISL. Let us assume we did not have any warning, but it was important to get a satellite up ahead of the Russians. Then should we not have done everything possible to get the satellite up as quickly as possible?

Mr. QUARLES. I think that we should have done some things that we did not do to get the satellite up; yes, sir. I would like to add to that that I think it was a good decision then, and is still, in retrospect, a good decision to make it a condition that they not interfere with the top priority of the ballistic missiles program.

Mr. WEISL. How would that have interfered with the top priority of the ballistic missile when von Braun said he could use the Jupiter, as it then was, to launch a satellite?

Mr. QUARLES. When Dr. von Braun recently spoke—

Mr. WEISL. I am talking about 1956. He said he was turned down twice in 1956.

Mr. QUARLES. Dr. von Braun, in discussing the satellite, the Army satellite project at that time, was asked how much sacrifice we would have to take on his ballistic missile programs, and he quoted the 3-month delay.

We felt that it was not wise to buy the program at that kind of a price, particularly since at that time, as of that time, the Navy was still on a schedule with its Vanguard program that would have launched prior to the Russians.

Mr. WEISL. Well, you had a missile similar to the Jupiter in development during that period, namely, the Thor, did you not?

Mr. QUARLES. It was in early development in 1956, yes.

Mr. WEISL. And the Army was not going to use the Jupiter for its own purposes anyway; was it?

Mr. QUARLES. The Army at that time was developing the Jupiter for the Navy's use, and as a backup for the Air Force's land-based Thor development.

It still had top priority for those purposes.

Mr. WEISL. It has top priority for Navy use?

Mr. QUARLES. It did at that time have top priority for Navy use.

Mr. WEISL. How could the Navy use it?

Mr. QUARLES. The Navy was working on a ship-based adaptation of the Jupiter missile, and the whole purpose of the Jupiter development was to produce a ship-based version and a land-based backup for the Thor missile.

This, however, was changed, Mr. Counsel, at a later time, and the Navy proceeded on a separate course for a ship-based version of the intermediate range missile.

Mr. WEISL. Now, why was Dr. Hagen turned down when he requested priority to get his satellite in the air before the Russians? He was turned down first, he testified, in 1955.

Mr. QUARLES. I am not aware, Mr. Counsel, that Dr. Hagen's request for priority was literally turned down. I do not know that part of the record. I will have to supply it.

Mr. WEISL. You heard Chairman Johnson read the record to Mr. McElroy.

Mr. QUARLES. I only heard it today, sir, and I have not had an opportunity to examine into the events to know what happened in action on his request.

I will be glad to supply that, but I do not know.

(The Department of Defense report on priorities—Vanguard, see p. 208.)

Mr. WEISL. You do believe, however, that Dr. Hagen testified truthfully under oath; do you not?

Mr. QUARLES. I have no question about that.

Mr. WEISL. Now, turning back to long-range and intermediate-range missiles, in order to launch them, you have to have launching bases; do you not?

Mr. QUARLES. For the land-based ones.

Mr. WEISL. For the land-based ones. And we are talking about the Thor, the Jupiter, the Atlas, and the Titan.

Mr. QUARLES. That is correct; yes, sir.

Mr. WEISL. Do we have such bases now?

Mr. QUARLES. I would prefer to answer that question off the record, sir.

Mr. WEISL. How long does it take to build one of those bases?

Mr. QUARLES. Well, I think it would be better to discuss that off the record, too, because it depends on the kind of base you build, sir.

Mr. WEISL. Very well.

Can those missiles be used on mobile bases?

Mr. QUARLES. It depends upon the definition of the word "mobile," and in my definition, I will answer the question, "No."

Mr. WEISL. They cannot?

Mr. QUARLES. But I admit it depends on the definition of mobility.

Mr. WEISL. Is it desirable to have mobile bases to launch missiles?

Mr. QUARLES. I would say that it would be desirable if circumstances permitted you to do so in a practical sense; yes.

Mr. WEISL. Well, isn't it practical to have mobile launching bases for intermediate missiles?

Mr. QUARLES. It is not at the present time, with our present equipment and technology; no, sir.

Mr. WEISL. Then if the Jupiter people say that it is, Dr. von Braun, you would disagree with that?

Mr. QUARLES. I would have to sit down and examine the meaning of the word "mobile," and I might then disagree or we might merely agree that mobile meant different things to different people.

Mr. WEISL. Dr. Von Braun stated that the experience in the last war was that the Air Force, the American Air Force, knocked out all the stationary launching bases of the V-2, and knocked out very few of the mobile bases of the V-2.

Is that statement true?

Mr. QUARLES. I expect it is true, because I expect Dr. von Braun knew as much about that as anybody.

However, I would say that the inference that you draw from that World War II experience with chemical explosive warheads and the other characteristics of the missile, the inference you draw from that would be very misleading when you translate it into a world war III atomic situation.

Mr. WEISL. If it is misleading, can you straighten it out?

Mr. QUARLES. Yes; I think I can straighten it out in this sense: Under the circumstances which we think we will have to operate under, it is going to be necessary to get these things off very quickly, and it may even be a one-shot per launching pad kind of a thing, anyway. And fundamentally, the situation has changed because of the vastly greater power of each one of these, and because primarily they are stationed to deter others from launching an attack or to respond to an attack if launched.

It is a different situation, fundamentally.

Mr. WEISL. That straightens it out, does it not?

Mr. QUARLES. I think not too well. I will be glad to discuss it further in closed session.

Mr. WEISL. In closed session.

All I wanted to point out was that we wanted to be sure we would have launching bases when we had the missiles ready.

Mr. QUARLES. Yes, sir; and I agree completely.

Mr. WEISL. I am sure you want that and we will discuss that further, Mr. Quarles, in executive session.

Mr. QUARLES. Thank you.

COMPLEXITY OF THE PENTAGON ORGANIZATION

Mr. WEISL. Now, a great deal has been said about the complexity of the organization in the Pentagon, in the entire military organization and in the time that is spent between starting a thing and getting it done. You have seen these charts that have been published in the papers.

Mr. QUARLES. Yes, sir; I have.

Mr. WEISL. Have you anything to say which would enlighten this committee in that respect?

Have you any recommendations to make?

Mr. QUARLES. Well, I can say that I think it is very important for us to keep an open mind and keep a critical attitude toward our organization, and to keep trying to improve it. So I would not for a moment wish to be construed as feeling satisfied with organization in the Pentagon or in the Military Establishment as a whole.

Mr. WEISL. Has that complex organization slowed up the missile program, in your opinion?

Mr. QUARLES. Since the long-range ballistic missile program was given its top priority, and expediting measures were established for the program, there has not been a holdup of that program due to organization. Although even here one has to be careful because obviously if we had a completely streamlined program that did not have to worry about money and accounting or a lot of other things very possibly we could have moved more rapidly; but this is not being realistic and answering your question as realistically as I am able to, I would say that organization has not in a practical sense slowed up the long-range ballistic missile program.

The Army's tactical missile program may very possibly be able to show places where it had been slowed up.

I cannot cite such a place, but I can believe it might have, and I would say, taking missiles and research and development broadly one would have to say that they have not progressed as rapidly as best organization should have made them progress.

Mr. WEISL. Must we be resigned to the fact that the organization must be as complex forever as it seems to be and as it seems to appear?

Can we do nothing about that, Mr. Quarles, must we have—for instance, how many committees are there under Mr. Holaday to advise him—he is the missile Czar, so to speak. He is the Director of Guided Missiles.

Now how many committees are there under him that he has to consult with and advise him.

Just name the committees.

Mr. QUARLES. I will be glad to, sir.

There are two committees that serve Mr. Holaday and his missile field.

One of these is an internal committee that is known as the Office of Secretary of Defense Ballistic Missile Committee.

The other is a Science Advisory Committee which is advisory to Mr. Holaday.

Mr. WEISL. What about the Joint Coordination Committee for Guided Missiles.

Mr. QUARLES. This is not in Mr. Holaday's ballistic-missile area. I have to be careful here because as of 10 days ago or whenever

the new directive was issued, Mr. Holaday took over the whole guided-missile program.

Up to that time he had dealt primarily with the high-priority programs.

Mr. WEISL. But Mr. Holaday is supposed to be the Director of Guided Missiles.

He is supposed to have the power of the Secretary.

The President said that he is supposed to be, in plain language, the boss of guided missiles.

Now here is a Joint Coordinating Committee for Guided Missiles that Mr. Holaday has not anything to do with.

Now with whom does this Joint Coordinating Committee for Guided Missiles consult?

What is that for?

What do they do, if they don't consult with the boss of guided missiles?

COORDINATING COMMITTEE NOT FUNCTIONING NOW

Mr. QUARLES. I will have to say first, Mr. Counsel, that since Mr. Holaday has been the Director of Guided Missiles, there has not been a separate Coordinating Committee on Guided Missiles.

You are dealing here with two different time periods.

During the time in which he had only part of the guided-missile responsibility, the part that he did not have was under the Assistant Secretary for Research and Engineering, and that Assistant Secretary, for his part, had a Coordinating Committee on Guided Missiles.

Since Mr. Holaday was made Director of Guided Missiles and given the whole field, assigned the whole field, he has taken over the area previously covered by the committee you mentioned, the Coordinating Committee on Guided Missiles.

Mr. WEISL. So that no longer exists?

Mr. QUARLES. I will have to ask Mr. Holaday whether he has continued to use it or whether—in any event it is under Mr. Holaday.

Mr. Holaday tells me they are in the process of cleaning up their work because it was a going concern when he took it over.

Mr. WEISL. Who appoints the Ballistic Missile Committee?

Mr. QUARLES. The OSD Ballistic Missile Committee is a group of the responsible officials of the Department, the Comptroller, the Assistant Secretary for Properties and Installations, and other people of that kind brought together to expedite their action on their phases of the missile program.

That is to say, the Comptroller is brought in so that when a program proposal is made he can pass on the financing aspect of the thing without having to take it for processing it in his organization, and similarly the installations man covers the provision of the new facilities that have to be provided.

It is merely an expediting arrangement to avoid normal staff actions and the necessary delays in the normal staffing of projects of that kind.

Mr. WEISL. How often does this committee meet?

Mr. QUARLES. On call and on need but I will have to ask Mr. Holaday that question.

Mr. WEISL. We will ask Mr. Holaday.

Mr. QUARLES. Thank you.

Mr. WEISL. What about the Scientific Advisory Committee for Ballistic Missiles?

What does that consist of?

Mr. QUARLES. That is a group of scientists and engineers and people in industry who are familiar with the program who are called in as consultants to study the program in its technical aspects, and who recommend to Mr. Holaday and the Secretary of Defense technical courses of action in the program.

It is entirely an advisory group serving the program and their country as well as they can, to make the best of it.

Mr. WEISL. Who appoints that committee?

Mr. QUARLES. The Secretary of Defense appoints them although you could properly say that Mr. Holaday appoints them.

Mr. WEISL. Then there is the technical advisory committee panel.

What is that?

Mr. QUARLES. Well——

Mr. WEISL. I guess that is an advisory panel on aeronautics.

Mr. QUARLES. There might be either of two things that you refer to there, Mr. Weisl and I am not quite sure which you are.

There is a technical advisory committee on aeronautics that deals with aircraft programs and problems in an advisory sense, and then in this satellite field, there is a special advisory group.

But that is in relation to space programs.

Mr. WEISL. Is there such a thing as a Thor-Jupiter Committee that is described in this chart or has that been done away with?

Mr. QUARLES. The Secretary of Defense in August appointed Mr. Holaday and the two officers in charge of the Thor and Jupiter programs respectively, General Schriever and General Medaris, to perform the specific task of deciding which program should be continued; and actually they were unable to make a choice for technical reasons.

So the committee continues until a choice or determination can be made.

Mr. WEISL. Now then, in addition to Mr. Holaday who is the Director of Guided Missiles, each service has its director of guided missiles?

Mr. QUARLES. I think not literally, sir.

I think each service does, however, have its ballistic-missile programs.

I don't know——

Mr. WEISL. Don't they have a head of a ballistic missile program in each service?

Mr. QUARLES. Other than the Secretary of the Department, who is of course the chairman of their respective ballistic missile groups——

Mr. WEISL. Let us take the Army Jupiter program—who is the head of that?

Mr. QUARLES. As a specific program in the Army, General Medaris is the head of it, but of course he is subordinate to the officials of the Army.

Mr. WEISL. He is subordinate to whom?

Mr. QUARLES. Well, he is subordinate to a number of people in the Army; and I am not sure I can trace the whole chain of command, but he is subordinate of course to the Secretary of the Army, and to

others in line under the Secretary of the Army. I will be glad to supply that for the record; I cannot give it to you now.

Mr. WEISL. Yes, sir.

(The Department of Defense memorandum on the chain of command relating to the Army Jupiter program is as follows:)

Major General Medaris is the commanding general of the Army Ballistic Missile Agency, the Agency charged with the development of the Jupiter IRBM missile system. Stated briefly, General Medaris' command channels for the execution of the Jupiter program are: Commanding general, Army Ballistic Missile Agency; to Chief of Research and Development; to Secretary of the Army; to Director of Guided Missiles, Office, Secretary of Defense.

The organization for direction and technical supervision of the Jupiter development program may be described in more detail as follows: General Medaris, as commanding general, Army Ballistic Missile Agency, is directly under the Army Ballistic Missiles Committee. The Army Ballistic Missiles Committee is actively chaired by the Secretary of the Army. Lieutenant General Gavin, the Chief of Research and Development, is the senior military member of the Army Ballistic Missiles Committee, and as such is authorized to act for the Chief of Staff, Department of the Army. The Army Ballistic Missiles Committee is, in turn, directly under the Office, Secretary of Defense Ballistic Missiles Committee, chaired by Mr. Holaday, Director of Guided Missiles.

CHAIN OF COMMAND FOR MISSILES IN AIR FORCE

Now who has charge of the Thor program in the Air Force?

Mr. QUARLES. The Thor program, again, is part of the assignment to General Schriever who is in command of what we for a long time knew as the Western Development Division, which was given a project responsibility for the Air Force ballistic program.

Mr. WEISL. To whom does he report?

Mr. QUARLES. General Schriever reports through the commanding general of the Research and Development Command, to the Chief of Staff of the Air Force.

Mr. WEISL. Whom does he take orders from?

Mr. QUARLES. Well, he takes orders from the Secretary of the Air Force as transmitted to him, either directly or through channels.

Mr. WEISL. Who has charge of the intercontinental ballistic program, take the Atlas?

Mr. QUARLES. General Schriever and the answers are exactly parallel. I thought you were speaking of—

Mr. WEISL. And the Titan and the Atlas are exactly parallel.

General Schriever is in charge under the Chief of Staff of the Air Force, and he is under the Secretary of the Air Force?

Mr. QUARLES. All three of those programs.

Mr. WEISL. And he takes his orders from General White or the Secretary of the Air Force?

Mr. QUARLES. That is right, sir.

Mr. WEISL. Now then, what about the Navy Polaris program. Who is the boss of that?

Mr. QUARLES. The Navy has an Admiral Clark who is responsible for their missiles program broadly; and under Admiral Clark is Admiral Raborn, who is in immediate charge of the Polaris program. Admiral Clark, in turn, has the same chain of command as the others that I have mentioned.

Mr. WEISL. And he takes orders from Admiral Burke who, in turn, is under the Secretary of the Navy?

Mr. QUARLES. That is technically correct; yes, sir.

Mr. WEISL. Then at the top of that is supposed to be Mr. Holaday who is the Director.

Now can he give orders to the Secretary of the Navy or the head of the Navy or the Secretary of the Army or the head of the Army missile development?

Mr. QUARLES. He can give direction to them which has the quality of an order; yes, sir.

Mr. WEISL. I see. I think Secretary McElroy testified in his interview he said that Mr. Holaday did not have the right to order the various branches of the military services in their guided-missile program but we can ask Mr. Holaday about that.

Mr. QUARLES. All right, sir.

Mr. WEISL. When he testifies.

Mr. Quarles, could you give us your opinion of the bottlenecks that exist which tend to obstruct or delay the development of guided missiles?

ROCKET PROPULSION IMPORTANT OBSTACLE

Mr. QUARLES. I think Mr. Weisl, if you put those in two categories, one would be the technical obstacles that have to be overcome in perfecting these weapons systems, and they are extremely complicated technically, and there is a very great amount of research and development to be accomplished in perfecting them.

In that area, if I am addressing myself to your question to cover the technical area, I would say that the principal obstacles have been, first, the development of reliable and powerful rockets for the propulsion of such systems.

Second, the development of aerodynamic means of control of these rockets while they are in the atmosphere, and in fact in some degree while they are in outer space, and the guidance systems involved in controlling their flight and putting them on target, and finally, the reentry problem of bringing the payload back down through the atmosphere, and, of course, the very important problem of developing a payload that will be powerful and also of such characteristic that it can be carried.

Mr. WEISL. Are you through?

Mr. QUARLES. Yes; but you wanted to be sure that this last point was made.

Mr. WEISL. Are there any other bottlenecks that you know of?

Mr. QUARLES. I would say that in the ballistic missile program these are the technical bottlenecks. In this program, I think that the funding and the priority of the support has not constituted a bottleneck although this would be true, I should say, in a complete sense only of these highest priority programs, sir.

Mr. WEISL. Have you any recommendations to make to the committee as to how some of these bottlenecks could be removed or how the program can be expedited?

Mr. QUARLES. We do have recommendations, Mr. Counsel, about these highest priority programs, and they involve the construction, the expediting of the construction of bases, and now the expediting of production. These recommendations are now being formulated and will be brought to the Congress as soon as they can be. I would say that if you like that I could discuss that more in executive session but that is a general statement.

WHAT WAS THE RESPONSE TO URGENT AIR FORCE PLANS

Mr. WEISL. I want to turn to another subject, Mr. Quarles, if I may.

You told the chairman and told this committee that you did feel a sense of urgency. That you were aroused over the present danger that we face, and have been aroused for some time and I am sure that you have been.

Now I have read hundreds of pages of testimony given to Senator Symington's committee and other committees, and in each of these hearings men from the Air Force have appeared, and they have stated in no uncertain terms that they need a dispersal of their bases in order to protect them. They need better pay for the airmen who fly these planes.

They must give better incentives to hold the men in the Strategic Air Command. That they need better housing for them. They need to get more and better planes and men to equip them and work on double and triple shifts to be ready, and be in the air as much as they can so that if the enemy should strike they will be in the air to strike back.

Now I have searched to find out whether anything has been done about those urgent, urgent requests by men like General LeMay, General White, and General Power in the Air Force.

What has been done about that?

Has all that testimony, all that pleading to keep that Strategic Air Command at its maximum efficiency been in vain? What has been done about it?

Mr. QUARLES. We presented to the Congress in 1956 a supplemental request for appropriations to initiate and to expedite the dispersal of the strategic bombers, and the Congress appropriated the funds requested and the program was carried forward at that time. We have that dispersal program underway today. We are actually, in one of our proposals to the Congress that we will make in January, going to ask for additional funds to further expedite and complete that program, as we see it.

This is merely—this merely addresses itself to the one point of dispersal of the heavy bombers.

There is another program which they have been very anxious to get for the dispersal of their tankers north, and this program is also being formulated for the expediting of this program, the program has been under way; the expediting of it is being formulated for its presentation to Congress.

Mr. WEISL. We do hear, Mr. Quarles, constant statements about expediting and furthering, hoping and presenting, but nothing seems to get done. These bases are not dispersed; these men are not being kept in the service.

The Strategic Air Command keeps losing its young men. It is not in the air enough to be on the alert constantly.

The men are not being paid enough to have an incentive to stay. They don't have the housing that they ought to have to make them happy. They do not have the hospitalization that they need to protect their families, and what we hear is what you have said: "We are expediting; we are going to present; we are hoping."

Now when will we get these thing done, Mr. Quarles?

Mr. QUARLES. I think, Mr. Counsel, we will never get the building of a military establishment done. At any time we approach the problem there will be things that we ought to do.

However, if we like to deal with specifics, I will be glad to supply for the record the extent to which dispersal bases have been created, and the extent to which the dispersal and moving north of the tankers have been gotten under way.

(The Department of Defense memorandum on Strategic Air Command dispersal is classified secret and is included in the classified record.)

There is one other matter that you referred to that I should have spoken of earlier.

This is the better treatment of our personnel, and particularly the better treatment of those highly skilled personnel that are vital to our success in running this business, and we will present to the Congress a program that is commonly known as the Cordiner program, to accomplish that purpose.

CORDINER PROGRAM RECOMMENDED

Mr. WEISL. You will recommend the Cordiner program?

Mr. QUARLES. That is right, sir.

Mr. WEISL. Why was it turned down before?

Mr. QUARLES. The Cordiner program was turned down for congressional action last year on the belief that it was not a good time to propose the action.

Whether that was right, wrong, or not, I can only say that I personally will be in strong support of the Cordiner program as soon as the Congress can see fit to consider it.

Mr. WEISL. Has that been cleared with the Budget Bureau and the President?

Mr. QUARLES. My statement is that we will present it, sir.

Mr. WEISL. And with the support of the President.

Mr. QUARLES. Well, we could only present the matters with the support of the President.

Mr. WEISL. Very good.

We have been advised by very knowledgeable and important people who know Government, know procurement practices that one of the great problems is the long lag between the time that a development idea is conceived and the authorization for design work.

I am told that it takes some times as much as 5 years to get a development idea into a design.

Is that true?

Mr. QUARLES. That is true, yes, sir.

In fact at times——

Mr. WEISL. Why does it take that long?

Mr. QUARLES. It depends entirely on the kind of design you are trying to produce.

Mr. WEISL. Let's take some specifics.

When was the idea of the Atlas first conceived, the long-range intercontinental ballistic missile?

Mr. QUARLES. First conceived in 1946.

Mr. WEISL. When was the first design granted?

Mr. QUARLES. First design granted?

Mr. WEISL. First design made, I mean.

Mr. QUARLES. Well, the first design of a complete weapon was made, I would say, within the last year or two and I wouldn't like to be more specific than that at this meeting.

Mr. WEISL. In other words, from 1946 to 1956?

Ten years to get what was then accepted as a good idea into work?

When was it first put into work? Let's start that way. It was conceived in 1946?

Mr. QUARLES. It was put into contract either in 1946 or 1947. I don't remember which one.

Mr. WEISL. When was it put into work?

Mr. QUARLES. I assume you mean by put into work, put under contract. It was put under contract either in 1946 or 1947, and I will supply that for the record.

(Department of Defense subsequently furnished the following:)

The correct date is 1946. In that year the Air Force initiated a program for a study of rocket missile capabilities, with the development of an intercontinental rocket as the final objective.

Mr. WEISL. What kind of a contract?

Mr. QUARLES. This was a research and development contract with Convair, the Consolidated Vultee Co.

Mr. WEISL. Was it, first conceived in 1946?

Mr. QUARLES. Well, conception of a thing of this kind is hard to pin down, sir. I don't believe I can answer that.

Mr. WEISL. Do you agree with this man's statement, and he is a knowledgeable man in government who states that sometimes a 5-year lag exists between the time that a development idea is conceived and the authorization for design work is granted.

Mr. QUARLES. I think that is very probably true, Mr. Counsel, and I think in fact you can find plenty of cases where authorization for design work has never been granted, because on analysis and best judgment it was not thought to be a wise thing to grant it.

Mr. WEISL. But suppose on analysis and judgment it is thought to be a good idea?

Mr. QUARLES. If it is thought to be a good idea and good in the sense that it is good enough to rate being done, then I think the granting of it is a matter of a very short time. But the problem here is not how long it takes to make a decision. The problem is getting enough information and understanding of the overall problem well enough to be sure that it is a thing that is wise to undertake.

Sometimes it gets to be wise to do later because the art has advanced to the point where it is practical and where it might not have been practical earlier.

CONTRACTS PROVIDE INCENTIVES

Mr. WEISL. We have also been advised that the relationship between the Government and the producers of weapons is such that there has been no way found to provide incentive to the producer to speed up production and cut costs.

Mr. QUARLES. Well, I have to disagree with that, sir. I think we do have ways for putting incentive into our contracts, and we, in all cases, try to write contracts with an incentive.

Mr. WEISL. What are those—I am sorry, sir.

Mr. QUARLES. It is difficult to do that on contracts where you cannot define the thing to be delivered well enough to be able to define the price and therefore the incentive.

However, where we are dealing with things that are definable, we always write into them cost-incentive features such as fixed price features where the profit depends on the contractor.

Mr. WEISL. Well, let's take the missiles field.

Suppose that supplier who is making the Thor delivers the missile 6 months ahead of time.

What bonus does he get for it?

Mr. QUARLES. In the case of the Thor: the Thor is contracted, as we see it, of necessity, on what we call a cost-plus-fee basis, where the contractor is reimbursed for his expenses, and this is done simply because neither he nor we could define ahead of time what the problem of producing a Thor would be.

This is inescapable under such circumstances but it is only typical of things that are so far out ahead of the established art that they cannot be defined.

Mr. WEISL. Let's forget about the established art. But suppose the fellow delivers that Thor ahead of time. Does he get some benefit for it? Is there any incentive for him to do it quickly? Does he get the same pay whether he does it quickly or does it slowly?

Mr. QUARLES. In the case of the Thor, Mr. Counsel, which was from the start a top priority project, the work that the contractor was called on to do, he was called on to do at the earliest possible time.

There has never been any way to define whether he was doing it earlier than he should or later than he should, because we credit him with the best possible effort in the field.

Mr. WEISL. Well, is there no way that you can give a man some incentive to do his work cheaper or better or more efficiently?

Mr. QUARLES. As I have tried to say, sir, there is a way we can do it; and we do do it in every case that we can find an ability to define the product to be delivered and, therefore, can define a price arrangement that gives him an incentive to a profit.

Mr. WEISL. Give us some illustrations where you do do it.

Mr. QUARLES. We do it, for example, in the production of aircraft after they reach a stage where the costs can be defined.

There are various forms of contract into which we write such incentives.

Mr. WEISL. Well, just tell us specifically, just what do you do? For instance, Boeing is making the B-52's. What incentive do you give Boeing to make the B-52 quicker?

Mr. QUARLES. I am not familiar with the Boeing contract in detail, and I may have to correct this for the record, but I will answer it as an example which is typical of such contracts where we have an arrangement under which the contractor does get a greater profit if he delivers at a lower than estimated price, and the circumstances determine how much of an incentive he is given in such contract.

Mr. WEISL. Who estimates the price?

Mr. QUARLES. The Government, and in this case the Air Force, is responsible for estimating the price.

Of course, this is done in best collaboration with the contractor, but it is the Air Force in this case, it is the Air Force's responsibility.

Mr. WEISL. Well, not to belabor the point, and not to continue the discussion, I will say to you categorically, we have been told by most suppliers that there is no incentive to do work quicker or better or cheaper, and no penalty for doing work slower or worse or dearer.

Now, if you can give us in writing some illustrations of how you control that, I am sure the committee would appreciate it very much.

Mr. QUARLES. I will be very glad to do so, sir; and I would like, in the meantime, categorically to disagree with such a statement. (Secretary McElroy's study on incentives and penalties, p. 203.)

Mr. WEISL. You have, though, admitted there is no incentive payment on Thor other than a cost-plus-fixed-fee contract, or any of the ballistic missile field.

Mr. QUARLES. I am quite sure as of today, that is true.

Mr. WEISL. Have you ever heard of Dr. Sterling Livingston, professor of the Harvard School of Business?

Mr. QUARLES. I have heard of him; yes, sir.

Mr. WEISL. Have you ever read his works on the incredible development of redtape in the United States Government?

Mr. QUARLES. I think I am pretty well aware of what he would say about it, and I think it makes very good reading, but I have not read it all.

Mr. WEISL. I see.

Is there anything that I have not asked which you feel I should have asked, or that you would like to say to the committee, or is there anything that you would like to correct?

Mr. QUARLES. Mr. Counsel, I think you have given me ample opportunity to make responses as I would like to, and I certainly appreciate—

Mr. WEISL. You have not been given ample opportunity?

Mr. QUARLES. No, sir. I say I think you have given me ample opportunity, and I certainly appreciate it.

Mr. WEISL. Thank you, sir.

Mr. QUARLES. May I add, sir, that counsel advises me that if agreeable to the committee, I would like to place the whole of the speeches we have been talking about in the record so it will be in there.

Mr. WEISL. It is entirely acceptable to counsel to place all of the speeches in the record.

Senator JOHNSON. Without objection, the three speeches referred to will be incorporated in the record.

Mr. QUARLES. Actually two. The transcript—

Senator JOHNSON. Two speeches?

Mr. WEISL. Two speeches, and a television interview.

Senator JOHNSON. Without objection, they will be incorporated in the record.

Mr. QUARLES. Thank you.

Mr. WEISL. Thank you.

(The documents referred to are as follows:)

ADDRESS BY HON. DONALD A. QUARLES, DEPUTY SECRETARY OF DEFENSE, BEFORE THE UNITED STATES CONFERENCE OF MAYORS, AT THE WALDORF-ASTORIA, NEW YORK, N. Y., MONDAY, SEPTEMBER 9, 1957

It is a great pleasure to be here with you and a high honor to take part in the program of this Conference of Mayors. I have had just enough experience in your business to have some understanding of your point of view and problems; and you are certainly vitally concerned with what I will call my business, although I realize as I say it that national defense is actually the business of all of us.

Before I tackle what one might call the global aspects of the defense business, I would like to speak briefly about some of the direct impacts of our current operations on the cities over which you preside. There is an almost endless list of such impacts so I will select only a few.

One that immediately comes to mind, and in which all of you are cooperating, is our Reserve program. As a matter of fact, the last time I had the pleasure of speaking here in New York was on Armed Forces Day when it was my pleasant duty to bestow on Mayor Wagner our Defense award for outstanding cooperation in the Reserve program, an award that some few others here in this audience have also received and that many others are no doubt becoming eligible to because of the generally fine cooperation we have in this field.

Then, too, I know that most of the cities represented here are hosts to one or more military bases or installations where the man in uniform comes in contact with your communities. To say that the soldier, sailor, or airman is just an American like all the rest of your citizens is to say the obvious, and still on analysis this is not quite as simple as it sounds. The man in uniform is set apart from other citizens by certain duties and obligations and by the very fact that, in greater or less degree, his service life forces him to be different. Let me say that I think we in the Military Establishment and you in your communities have made great progress in working out these community-serviceman relationships to the point where they are most wholesome and beneficial to the serviceman and I believe also most satisfactory to the communities. This has required the special thought and attention of the military, and it has also taken the organized and patriotic effort of many members of your communities, both within and without your official families. I am happy to have this opportunity to record our appreciation in Defense for the fine job that your communities have done.

Quite aside from community relationships, there are many matters of common concern to your cities and the Defense Establishment. For obvious military reasons, many of our installations are in or near large centers of population. In some cases, the densely populated areas have grown out toward military bases, and in some others our uses have changed to the point where municipal interests and military interests have clashed. The military, of course, have as their sole reason for being to serve the security of the people as a whole as well and economically as possible. In doing this, however, it is sometimes necessary to call on the local communities to make compromises or concessions to the larger national interest. I have in mind such things as airbases, missile sites, and the like. In this atomic age when security deals with the potential loss of millions of lives, we must not be prevented from building and maintaining the necessary defensive arrangements, even though these may involve potential hazards to local communities. We must, of course, minimize the hazards in every practicable way. Accepting these facts of life and standing firm and resolute in the face of them is just part of the toughness required of all of us in the period immediately ahead.

Another matter of great importance to some of your communities is the economic impact on them of military activities and procurement. There has been much public notice in recent months of retrenchments of various kinds in our national overall defense effort—closing some installations, canceling some projects, and stretching out others—to the degree that a false impression may have been created. These changes are an important and necessary adjustment, and there are a few communities that have been seriously affected by them, but we must keep them in perspective. We will still have a very substantial military program, and a very fine defense position. As I shall attempt to bring out a little later on, we must continue to have a very substantial program if we are to maintain a proper military posture in this dangerous atomic age. We must continue, that is, until such time as a new system of world law and order can take the place of this kind of security by armed defensive might. As to the economic impact of this adjustment I can only say that we in Defense are not only well aware of it, but we are also most anxious to minimize it. We hope it will be possible to make a downward adjustment, from last year's high level, of 5 percent or so in the overall defense expenditure without too drastic an effect on the economy as a whole, or even on individual communities where the effect is, of course, spotty; and this is what we are trying to do.

Perhaps with these examples I have taken as much time as I should on the municipal aspects of defense, particularly as I suspect I have already stimulated some broader questions, if not challenges, about some of its global aspects. This calls for some straight talk. I hope to strip it of any political entanglements.

In the backdrop for this part of my remarks we find such things as the recent Soviet intercontinental missile announcement; the disarmament talks in London;

recent world events particularly in the Middle East; defense budget requests and congressional action thereon; and the lively discussion in Congress and the press of our military assistance program. All of these things have an important bearing on the problem of national defense. Pervading it all, and in fact dominating some aspects of it, is the phenomenal advance in science and technology as applied to the art of war—an advance that has had a truly revolutionary impact.

We don't have time here today to go very deeply into the fundamentals of this situation. Suffice it to say that the U. S. S. R., from a well-behind start after World War II, has pulled up into a challenging position. We are no longer alone in having the ready capability of inflicting terrible damage on an enemy. We now must reckon with a similar, although not necessarily equal, U. S. S. R. capability. For a decade or so after World War II peace in the world rested primarily on the foundation of our retaliatory capability and our will not to use it unless attacked. From now on peace must depend also on the will of a Communist power not to use its growing air-atomic capability. Without drawing any conclusions about the present peaceful intent or otherwise of this Communist power, it is my conviction, and I hope it is yours, that under such circumstances and until there is something to take its place, our national security requires us to maintain a defensive retaliatory position that will, at any point of time, make it clearly unprofitable for the Communists to resort to aggression against us. Intent, no matter how good, is too ephemeral a thing to rely on.

This is not a new concept. It is, however, complicated, one might say even paradoxical, so it is apt not to be generally understood. In the preatomic era, with our sheltered geography, we could get by with the plowshare-to-sword-to-plowshare routine. Now our ocean barriers have largely disappeared. Defense and retaliation must be instantly ready. Given time to mobilize our industrial might after the conflict began, we have always been confident that we could win out. Now the situation is reversed. The industrial might must be applied in advance to keep the war from starting. The way to win all-out war is to prevent it.

That does not mean peace at any price. It means standing strong for an honorable peace—the only kind that can last. Such a need for military might at the ready, in the absence of war or even of war clouds, is new in our history. Our statesmen at the municipal level and at all other levels of our Government have, I submit, a solemn duty to see that the significance of these facts is understood by our people. The danger isn't that we will be attacked today, but that we will so lower our guard that we might be attacked tomorrow.

What military might is necessary and sufficient to keep up our guard and achieve this deterrent objective? No one can answer this question with complete finality. The answer certainly depends on what our competition does. It depends on science and technology and the energy and resourcefulness of each side in exploiting it. It depends greatly on our free world friends and allies and what they are able to contribute to free world collective security; and this in turn depends in good measure on the assistance we are willing to give them.

And, of course, maintaining peace is not the whole problem. We must preserve our freedoms and our economic vitality in the process. And similar problems exist in every other freedom-loving nation, so there is a very important place in this picture for our mutual security and economic assistance programs. This is the gist of the March 1, 1957, report of the President's Citizens Advisers on the Mutual Security Program. The seven advisers were headed by Mr. Benjamin F. Fairless, and I believe you would agree that they were all tough-minded, objective citizens without bias in the program. I would like to quote the two key conclusions of this report:

"Your Citizen Advisers therefore conclude, Mr. President, that a collective security program will be essential for some years to come. It is in our national interest to be a part of such an undertaking, and we recommend that the program be continued so long as present critical world tensions persist.

"To this end, the public must understand that the program is one of collective security and not just a program of aid."

I know of no thoroughgoing investigation of our collective security situation that has not reached substantially the same conclusions.

So, this is the essence of our problem. Now, just a few remarks about how we are doing.

First, a word about fiscal matters. The appropriations for national security have, I feel, been disappointing. The appropriations for defense account were some \$2.5 billion below the President's original budget request. The appropriations for military assistance and defense support to our allies, not including economic assistance, were some \$0.5 billion less than requested. Not all of

these were unilateral congressional cutbacks. Some of the cuts were accepted by the administration as the whole picture unfolded. But speaking broadly, the new defense and mutual security funds provided were some \$3 billion less than the original budget submissions to the Congress, and these submissions in turn were, of course, much lower than earlier departmental estimates. Perhaps the most disturbing aspect of the whole matter from my standpoint is the change in climate from last year, when \$900 million extra was added by Congress to the Defense budget to meet what Congress believed to be the national security problem, and this year when \$2.5 billion was cut from the budget request.

Fundamentally, this change in climate reflects a change in public estimate of our security position that, in my judgment, is not justified by the facts. If it should represent a first step toward typical postwar complacency, it would be very alarming.

Fortunately, or unfortunately, depending on how you look at it, we occasionally get helped out in these public relations matters by our Communist competitors. Events of the last month in Syria have shown a modern handwriting on those ancient walls. The recent Soviet actions in the London arms talks were characterized by President Eisenhower in these words:

"It is deeply disappointing to all true lovers of peace that the Soviet Union should have already attacked, with such scornful words, the proposals which Canada, France, the United Kingdom, and the United States are putting forward at the United Nations Disarmament Subcommittee in London. It is noteworthy that this attack coincides with the boastful statement by the Soviet Union that they have made advances in the development of means for bringing mass destruction to any part of the world."

This latter is a reference, of course, to the Soviet announcement claiming that they have tested an intercontinental ballistic missile. I would like to dwell a moment on the technical aspects of these claims and their relation to our own work in this field. First, one has to presume that the Soviets were not trying to improve our intelligence estimates of the progress of their work. On the contrary the presumption must be that they tried to give us as little information as possible and still achieve their propaganda objectives. A very careful reading of what they said confirms this theory. President Eisenhower called it a boastful statement, and this is exactly what I think it was—not in the sense of untruth, but in the sense of creating an impression that substantially exceeded the truth.

Let me elaborate. The two key paragraphs of the Soviet announcement were unofficially translated as follows:

"A super-long-distance intercontinental multistage ballistic rocket was launched a few days ago. The tests of the rocket were successful. They fully confirmed the correctness of the calculations and the selected design.

"The rocket flew at a very high, unprecedented altitude. Covering a huge distance in a brief time the rocket landed in the target area. The results obtained show that it is possible to direct rockets into any part of the world."

The phraseology is significant. It speaks of a single rocket that was launched a few days ago. The tests purportedly were successful and confirmed the calculations. The range was not disclosed, and the test results were not disclosed. The rocket met expectations and landed "in the target area," which is also not defined. This is the way we would describe a first experimental test, not necessarily even a prototype of a fully developed weapon. In our experience, it is a far cry from this to an operational weapon system.

According to the last quoted sentence, the results obtained show that it is possible to direct rockets into any part of the world. I would say that we already knew it was possible to direct rockets into any part of the world. The question is when will it be practicable to do so, and from just what launching points and with just what precision and reliability.

You can see that upon examination this Soviet announcement is most vague. Of course, we would all like to know just where their development stands as compared with our own. I want to make it clear that we have for some time credited the Soviets with substantial progress in the long-range ballistic missile field. We have also emphasized that our own work in this same field is being pressed forward on a broad front and with a high priority. Following the Soviet precept of not telling the competition any more than necessary, I can only say that after examining all the evidence, I am confident that we will not be outdistanced in this so called ballistic-missile race.

I would like, however, to emphasize the fact that even with an operational intercontinental ballistic missile system, it will be only one of the available means of delivering atomic destruction at great distances. And so long as we have

well-proven manned bomber systems that have the ability to penetrate and reconnoiter the target area, ballistic missiles will not even be the preferred method of accomplishing the mission. Therefore, while time differences in the ballistic missile race will probably not be very great one way or the other, it is my feeling that the military significance of this particular phase of the competition has been exaggerated.

Even so, our long-range ballistic missile program is continuing with a top priority. It has called for new development on a wide front. Progress has been generally satisfactory, although as in all cases, not uniformly so. It has been a very expensive program because we were buying time, for example, by duplicate approaches to some of the tough problems. Quite recently, we have been scrutinizing this along with all our other programs. We make no apology for any economies that we can achieve even in these very high priority programs. We do insist, however, that a sound defense comes first, and that economies must be made with due regard to the national security values involved. Moreover, we still do not expect to be beaten in this ballistic missile race.

In closing, I want to be sure to leave the record straight on one or two fundamental points. First, our clear long-range objective is a just and lasting peace, and our national purpose to work out the conditions for such a peace should be clear to all. Second, in striving for this goal we should regard military might as a deterrent to war, a holding action while the necessary adjustments are being made and an effective organization is worked out to replace deterrent might as the means of enforcing law and order in the international community. This will be a successful holding action only if our deterrent carries conviction to any potential aggressor that aggression would be disadvantageous rather than advantageous to him. In this terribly dangerous atomic age, it is clear that this is no time to be rattling our sabers. It is equally clear that world peace may well depend on our having here and in the free world as a whole a confidence based on capability and a determination to stand firm even when Communist sabers are rattled. This will call for strong nerves. Keeping our eyes on the ultimate goal, it will continue to challenge the best efforts of all of us.

REMARKS BY HON. DONALD A. QUARLES, DEPUTY SECRETARY OF DEFENSE,
BEFORE THE WINGS CLUB, NEW YORK, N. Y., MONDAY, NOVEMBER 18, 1957

It is a very great pleasure to be here with you this evening and a very great honor to be the recipient of the Wings Club Award of Merit. Reason, of course, tells me you have been overly generous in your appraisal, but I confess to you that something deeper in me than reason is touched by your kind words and warm welcome. My appreciation is all the keener as I look out over this audience and see so many whose esteem I would particularly value.

The first suggestion that I might join you here this evening came last May. Pleased as I was, there were so many uncertainties in my path between May and November that I had to beg for time. For one thing, I wanted to be sure that the vicissitudes of Washington life would leave me persona grata until the date of your meeting—a point you have been kind enough to resolve in my favor. The other uncertainty had to do with what we call the climate in Washington. On this point I decided late in August that the almanac forecast for November did not look too bad. All of which proves I was using the wrong almanac, because things certainly started happening shortly thereafter, which, even in Washington, would be called bad weather.

But it's an ill wind that blows nobody good so let's have a look at it. I hope I can clarify some of the issues that have been raised. At any rate, I can give you my own point of view about them, realizing that I have a very knowledgeable audience that will readily fill in any of the pieces that I have to leave out if I am to stay reasonably within bounds of your program this evening.

While the analogy is by no means perfect, one might compare the dawn of the space age, which we are now witnessing, with the period some 50 years ago when aviation was experiencing its early growing pains. I certainly would not prophesy that outer space activities in the next 50 years will parallel the phenomenal developments of air vehicles in the past half-century. On the other hand, I would not wish to play a role at this time comparable to the role played 50 years ago by those officials of the Military Establishment who took some time and had great difficulty in reaching the conclusion that aviation might possibly have some military value. The world has changed and we can no longer enjoy the luxury of that kind of cautious conservatism.

In addition to the impact of the completely unpredictable growth in aviation during this past period, the two world changes that most force our hand today are, it seems to me, the development of atomic explosives and, in the political field, the challenging position of the Soviet brand of monolithic and aggressive Communism. In combination, these things have revolutionized the world environment in which we must live and, at least in the defense business, our actions and reactions must be conditioned by them.

Before talking further about the new space age, perhaps we should define what we mean by outer space. For our present purposes I suggest we distinguish it from the airspace by noting that craft in outer space will be so little influenced by the atmosphere in the near vacuum in which they move that their motions will closely follow Newton's and Kepler's laws; whereas, aircraft will carry wings which depend on aerodynamic forces, not to mention the fact that most of the aircraft have air-breathing engines that depend on the oxygen in the air for combustion of their fuels.

This puts such things as the long-range ballistic missiles and the earth satellites in the space craft category, and I am sure you have been waiting for me to mention these items. While Sputnik I and II were by no means the first space craft, since many ballistic missiles launched by the Germans, Russians, and ourselves had preceded the satellites into outer space, the satellites are very significant in that their period of escape from the atmosphere is measured in days or months as compared with the few minutes of ballistic missile flight.

I trust that I have not offended your honorable organization by defining space craft in such a way as to outmode wings. I note, too, that one of your constitutional purposes is to "provide for the advancement and development of aeronautics, domestic and foreign," and I must invite your attention to the need for an amendment of your constitution to include astronautics as well as aeronautics; and further to remind you that outer space should be quite international in character so it would be anachronistic to refer to it as either domestic or foreign. If you would like a suggestion from the Pentagon as to how to get a constitutional change like this made on a timely basis, I would suggest that you appoint an ad hoc committee to study the matter.

I have now used up all my excuses to avoid talking about sputniks. You will understand my reluctance when I remind you that so far no one in the administration has yet succeeded in saying anything about sputniks that the critics didn't tear to pieces. Perhaps I should start off by admitting that I have long had something of a passion for astronomy; in a mild form, I am a star gazer; satellites affect me emotionally; and I can feel the allure of space travel, although not irresistibly, I must say. Moreover, I had enough information about our missile and satellite programs to be impressed by the Russian sputniks. They are a significant technical achievement, significant in themselves and significant as an indication of the state of advancement of their military rocketry. It is no disparagement, then, to say that they have little or no other military significance. They do not prove that the Russians are more advanced in military rocketry than we are. Even if they did, this would be a minor, rather than a major, factor in the near term balance of military power. There is a long step from the testing of such rocketry to the deployment of acceptably reliable, accurate, and therefore sound atomic weapon delivery systems based on rockets of intercontinental range. I have no doubt both they and we will develop such weapons, and I do not expect that there will be a significant time difference either way. The important thing to remember is that even after such weapons start to become available for some time to come thereafter, manned bombers will dominate the strategic delivery scene—and our strategic delivery position is now and will continue to be a sound deterrent position.

And so, when we place Sputnik I and Sputnik II in proper perspective, we must regard them as first and exciting probings into the mysteries of outer space. We must expect to see American satellites, as well as additional sputniks, orbiting in the reasonably near future. And, no doubt, satellites will get to be progressively more elaborate and sophisticated.

One rather important point that I alluded to earlier seems to have already been established by the fact that sputniks have now overflowed practically every nation on earth many times. This point is that outer space is international space, and that satellites traveling in orbit in outer space are not offensive in character and therefore do not violate the sovereignty of the nations overflowed. This is an important point and, as I said, one in which the sputniks have been very helpful.

I find in the existence of the first satellites no cause for national alarm. In this respect I am disagreeing with many people who have been saying "Let's beat

them"; "Let's put up a bigger satellite"; "Let's hit the moon with a rocket"; "Let's shoot something farther"; and "Let's reorganize."

May I comment briefly on this reaction. First, in this present technological competition it is imperative we not be sidetracked from our prime security objectives by extraneous or irrelevant issues. The overriding objective of our present effort must be to maintain adequate military forces in being—adequate to deter military aggression or to defeat its purposes if our deterrent should fail.

After all, we are facing the very real threat of existing Communist armed forces. Russia alone has more than 170 divisions; her western satellites have another 70; and the Communist Far East around 200—a grand total of around 440 divisions. When we add to this the Communist-bloc combat aircraft strength of more than 25,000, including the most advanced types, and her 500 submarines (the largest submarine fleet in the world), we see a very formidable immediate capability.

We must not be panicked or pushed into any sudden dispersion of effort which would scatter our talents and resources in an unprofitable or wasteful manner. We must not be talked into "hitting the moon with a rocket," for example, just to be first, unless by doing so we stand to gain something of real scientific or military significance.

When Sputnik II arrived, there was much clamor for drastic organizational shakeups and much talk about missile czars. Incidentally, there have been three men who successively occupied so-called missile czar positions in Defense. The first was Mr. K. T. Keller, who came in early in the Korean war buildup. He did a wonderful job of expediting important programs, but by his own choice he did it with substantially no formal delegation of power. Moreover, he insisted on being relieved when he felt that he had finished his job. He was succeeded in due course, first by Dr. Eger Murphree and later by Mr. William Holaday, both eminent in the field of science and technology. Both have done great jobs under a charter which, while somewhat strengthened, nevertheless continued to emphasize unseen rather than formal power. In order to make sure that Mr. Holaday's authority matches his great responsibility, the Secretary of Defense issued last week a new directive which made Mr. Holaday Director of Guided Missiles and placed him in solid charge of this program.

While organization is important, it has not, in my opinion, been a controlling factor in our long-range ballistic missile programs. For some time, these have been given the highest national priority. They are progressing well, and are substantially on schedule. As the President recently announced, our ballistic test missiles have made many successful flights to as much as 3,500 miles. Another series of rocket experiments in the Pacific achieved altitudes of over 2,500 miles. Unfortunately, some of our initial test missile facilities received so much publicity that they created an unduly pessimistic picture in the public mind. We have a strong program that we can be proud of.

I would like to remark on Russian ballistic missile claims and status. First, the fact that they claim a successful ICBM test does not necessarily mean they are anywhere near the time period when they will have operational units of inter-continental range. Their first very long range missiles were undoubtedly test vehicles as were ours. Their ICBM announcement and their later references to it have been most carefully worded to create the impression they wanted to create, and to avoid disclosing anything about the range, accuracy, or stage of perfection of the weapon.

It takes us years to produce a new weapon system like the B-52 bomber. The ballistic missile problem is even more difficult and takes even longer because of the many tough technical problems that have to be solved. The very size of the equipment and the test facilities adds to the difficulty. In our experience, there is a long time period between the first test firings and the final operational weapons. We have no reason to believe it is significantly different with them.

May I remark here on the frequently repeated view that the ICBM is the ultimate weapon. Whether it is ultimate no one knows. It certainly will not be a decisive weapon until a nation possesses proven operational missiles in considerable quantities. For many years to come, the manned nuclear bomber will be the primary deterrent weapon in our arsenal. This will probably also be true for the Soviets, despite their attempts to convince the world that manned aircraft are obsolete.

It is important that we undertake defense planning with two time periods in mind—first, today and the immediate future, and later that space era when long-range ballistic missiles are in operation, and other space projects of military importance are realities.

I believe there is no question that our near-term position is sound. Our concern is with the speed and scope of the Soviet progress. We must be aware of the challenge this holds for us in the future period. We, too, must push ahead on a broad front, with due regard to scientific foundations for the long-range effort. As the President brought out so well in his Oklahoma City speech last week, this calls for a new look at our educational system, along with increased emphasis on basic research. It is in this long pull sense that the Communist challenge must be taken most seriously.

It is interesting and revealing in this connection to study Mr. Khrushchev's recent tough and threatening remarks and relate them to Soviet actions. They have sought to capitalize on their recent missile achievements as a means of regaining some of the international prestige they lost when the rest of the world looked over the fence and saw what peace-loving communism did to the Hungarians and Poles.

At the same time, Mr. Khrushchev is saying airplanes are obsolete museum pieces, that the U. S. S. R. wants peace and supports peaceful methods, and that the United States has blocked disarmament efforts, Russia widely advertises her "intercontinental" ballistic missile, brags about her rockets, builds large numbers of modern combat aircraft, including intercontinental bombers, and then walks out of the United Nations disarmament talks.

All the while the Soviets are building and maintaining these huge forces, and in spite of the very considerable scientific progress they are making, her general economy remains far behind our own, as illustrated by the fact we produce twice the steel she produces, 14 times as many motor vehicles, more than 3 times as much electric power, and operate 3 times as much railroad mileage.

Perhaps the significant point here is that a nation with only a fraction of the industrial strength and resources of our own can, with its ruthless dictatorial system of government, make impressive progress along the lines in which they choose to concentrate their efforts. We can deplore the sacrifices their people are called on to make, but we must not fail to meet the competitive challenge. It will be costly and call for sacrifices on our part, in the form of personal effort on the part of some, and greater tax burdens than we like to bear on the part of all. If we are at times annoyed by the sacrifices we must make, we have grounds for hope that those under the Communist yoke will become outraged by theirs.

Our course seems very clear to me. We must do whatever it takes to meet this situation. We must recognize our community of interest with our free world friends and allies. We must, collectively with them, maintain adequate deterrent forces in instant readiness. We must plan our own programs for the long pull so that military security will not be undermined by economic insecurity. We must strengthen our foundations in the field of scientific and technical training and in basic research. And specifically we must broaden and deepen our programs for the exploration of outer space. We have the capacity to meet this challenge and still enjoy the highest standard of living that any people have ever enjoyed. My belief is that we would want to meet the challenge even if the standard of living had to suffer.

In closing, I would like to quote a few sentences from President Eisenhower's Oklahoma City speech which seem to me to epitomize our position:

"The goal we seek is peace with justice. This can come to our Nation only as it comes to all. The world's hope is that the Soviets will cooperate with all the rest of us in achieving this goal. Our defense effort, large as it is, goes only far enough to deter and defeat attack.

"We will never be an aggressor. We want adequate security. We want no more than adequacy. We will accept nothing less."

[From the NBC television program Youth Wants to Know]

YOUTH WANTS TO KNOW

Founded and produced by Theodore Granik

SUNDAY, NOVEMBER 10, 1957

YOUTH WANTS TO KNOW PRESENTS HON. DONALD QUARLES, DEPUTY SECRETARY OF DEFENSE; STEPHEN MCCORMICK, MODERATOR

The ANNOUNCER. Youth Wants to Know, the Peabody Award-winning program founded and produced by Theodore Granik. And here is your moderator, Stephen McCormick.

Mr. McCORMICK. Recent successes in rocket and missile development by the Soviet Union have resulted in serious criticism, both at home and abroad, of our scientific progress. Capitol Hill is starting a complete and thorough investigation of our program and President Eisenhower, in order to overcome Soviet supremacy in this field, has just appointed a czar to supervise and coordinate all phases of our scientific development.

Today our guest on Youth Wants To Know is one of the most important men in this entire program. He is Donald A. Quarles, Deputy Secretary of Defense.

Welcome to Youth Wants To Know, Secretary Quarles.

Secretary QUARLES. Steve, it is a great pleasure to be with you on this program.

Mr. McCORMICK. As you know, the young people appearing here today and under the auspices of the National Education Association have many questions for you.

Question. Mr. Secretary, how long do you think it will take us to catch up with the Russians in the satellite field?

Secretary QUARLES. Well, "catch up" is a difficult word because you have to define it more accurately. Of course, we will not have our scientific satellite up until probably March, although there will be some smaller ones put up earlier than that, and so March is perhaps the first date to mention there.

Question. Well, do you think as soon as we get our satellite up we will be up with them?

Do you think we will have more technology?

Secretary QUARLES. I would expect we will not, because I would expect they would do other things in the meantime along this general line.

Question. You say we won't get our satellite up until March. The scientists at the Redstone Arsenal said they could have put up a satellite 6 months ago. Why couldn't they have put it up then?

Secretary QUARLES. Their program involved the use of military rockets and involved some delay in military programs and we thought it was wise to make our satellite program purely a scientific program to serve the scientists and that is what has been done.

Question. Mr. Secretary, why is it that the sputnik was the only reason that the President and the Pentagon were awakened.

Why was this? Why did it take the sputnik to wake up the President and the Pentagon?

Secretary QUARLES. Of course, I won't agree with you about the waking up process because we were, I think, quite wide awake before that. It is true there was great popular interest in the Russian satellite and this has stimulated a lot of talk about this particular line of work.

Question. Well, Mr. Quarles, can you tell me, are we just ahead of the Russians—are we ahead of the Russians in some fields or are we behind in just this one field of the satellites? Are we ahead in some things, too?

Secretary QUARLES. Of course we are. In many fields of science and technology, there is no question about it. You only need to compare our life and the things that we enjoy with the things that they enjoy, generally. But in this particular field of earth satellites which they chose to emphasize, I think they are at the moment clearly ahead.

Question. Are we ahead of them in some other fields, in the scientific field?

Secretary QUARLES. Of course we are.

Question. What fields?

Secretary QUARLES. Well, a great many, but if you wish to limit it to the fields of military technology, which perhaps I should limit my discussion to, I should say that you would have to look hard to find fields in which they were definitely ahead of us, but I do agree that the earth satellite is one particular area.

Question. Exactly what fields are we ahead in? You said we are, but you failed to enumerate them.

Secretary QUARLES. I feel we are ahead in electronics. I feel we are ahead in atomic weaponry. I feel we are ahead in many branches of aviation, but I do not include the particular area of earth satellites which isn't incidentally a military area.

Question. Well, sir, in this morning's paper, Dr. von Braun said that these sputniks would lead to our outer space control and he said in 15 years this would be more or less like the control of the air, what it is today.

He was mentioning that was the one thing, but don't you think that could lead to our downfall, more or less, as the military control?

Secretary QUARLES. Well, I think outer space is going to be increasingly important and I think that we must undoubtedly move more energetically into this

area. However, I don't see in it the kind of threat to our security that you are interpreting, Dr. von Braun is implying.

Mr. McCORMICK. You disagree with the doctor, then, Mr. Quarles?

Secretary QUARLES. I don't remember and I don't know that Bill was quoting him exactly, but at any rate I would not say there is an indication that we will be in the danger that Bill has mentioned.

Question. Mr. Quarles, in the development of the intercontinental ballistics missiles and rockets, exactly where does the United States stand in relation to the Soviet Union?

Secretary QUARLES. Well, that is an area that you realize I can't quite respond to and say exactly because I would have to talk about things that I think we shouldn't talk about in exact terms, but I would put it generally that we have a program that is advancing very rapidly and very strongly. It is uncertain in my mind whether they will be ahead with actual operational capability in this very long-range ballistics missile field and in any event I would say that there will not be a great difference in the time of their operational capability and ours.

Question. Well, Mr. Secretary, are we or are we not ahead of the Soviet Union in this field?

Secretary QUARLES. In the field of intercontinental ballistics missiles?

Question. Yes.

Secretary QUARLES. I think it wouldn't be possible for anybody to answer that question exactly in terms that you ask it.

Question. Well, the Russian rocket which sent up Sputnik No. 2 is said to have 400,000 to 600,000 pounds of thrust and they say it can deliver a hydrogen warhead to the United States.

Do we have any rocket which is that powerful?

Secretary QUARLES. Henry, you say that it is said to have had that thrust and I would have to find out who said it and know a little more precisely about that. I don't think we have authoritative information to support that statement, and I would like you to remember that when you speak of a rocket it may involve many rocket engines, rather than just one rocket engine, so we have to be careful in the way we say that.

Question. Well, their rocket lifted 1,000 pounds up 1,000 miles, and it is capable by scientific figuring of carrying 5,000 pounds to the United States without getting out of the atmosphere.

Have we a rocket that is capable of lifting that weight?

Secretary QUARLES. We have rockets that are capable of doing the kind of thing you are describing, yes.

Question. Then why haven't we sent them up and started an artificial satellite before theirs?

Secretary QUARLES. As I have tried to explain, I think it was to Bill or Carl a little earlier, we didn't consider that an important part of a military program, and we just didn't schedule the doing of it and haven't done it. We have a scientific satellite program, only.

Question. Mr. Secretary, in what way will our satellite be superior to that of Russia?

Secretary QUARLES. Well, our first satellite I would say, will be somewhat superior to their first satellite because it will involve instrumentation that has been carefully prepared in cooperation with the scientists of the world, including scientists of Russia, to perform certain experiments and send back certain data on certain wavelengths. None of these things were provided by the first Russian satellite.

Question. Mr. Secretary, exactly who is responsible in the Government for this recent lag of the United States behind Russia?

Secretary QUARLES. The lag in the satellite field, if that is what you mean by the recent lag, I would say is the responsibility of all of us who planned this program for our scientific satellite in collaboration with the International Geophysical Year. I don't think you can say that any one person is responsible. It simply seemed the wisest course for the Government to follow.

Question. Why wasn't one sent up before this time? I still don't understand why, if we could have gotten one up before, why we didn't do it.

Secretary QUARLES. I think as we look back on it, we would all share your view that it would have been wise to put one up sooner, but don't overlook the fact that we are still exactly on the course we laid out for ourselves to put up the scientific satellite during the International Geophysical Year.

Question. Mr. Quarles, the United States has spent millions of dollars in presenting favorably the American way of life overseas, in Europe and in the Middle

East. Yet recently it has been virtually ignored—the political influence of the satellite.

Did the United States not lose a lot of prestige when the satellite went up?

Secretary QUARLES. I am not in a good position to tell you how much, if any, prestige they lost. I think undoubtedly there has been some influence. People from abroad that I have talked to about it have not implied to me that the influence was great.

Question. Secretary Quarles, it has been stated in the papers that the United States is at least 5 years behind in their ballistics-missile program. I would like to know, if we had a satellite which was launched first, do you think that this lag of 5 years would have had as much attention as it does now?

Secretary QUARLES. Well, again you speak, Ernest, of the papers saying a lag of 5 years. The only reference to 5 years that I myself know about from official sources was the fact that in a high-priority program we were perhaps 5 years later than they were in starting this kind of work, but that is not to say that we are 5 years behind them and, as I tried to say earlier, I think there is no such difference at all.

Question. Well, do you think that some of our allies will be turned toward Russia for any kind of support, economical or political support? Because of the Russian satellite?

Secretary QUARLES. I haven't heard of any of them who have shown any slightest indication of such a turning.

Question. We have heard so much about our country losing time by not starting right after the Second World War and working on these projects.

Why didn't they start the missile projects immediately, instead of waiting until the early 1950's?

Secretary QUARLES. We did start some ballistics missile work. We started many missile programs and we must be careful about words, because the word "guided missile" is quite broad and we might have three dozen different kinds of guided missiles. Most of us today are talking about long-range ballistics missiles that go up into outer space, so I think that is perhaps what you were talking about, and my answer to you there is that while we started a moderate line of development, we did not emphasize it for very technical reasons; it did not at that time have promise of being a very useful weapon, which it now has, I admit.

Question. Sir, what defense is there against the ICBM? It has been said that radar can't track it. Are you working on any defense right now and, if so, what is it?

Secretary QUARLES. Well, radar can track it and radar that can track it at great enough ranges to be useful is quite a possible thing, but it is also quite a large, expensive thing.

We are working on the development of radar and other devices that would be involved in a defense system, but everyone recognizes that the defense against a weapon of this kind would be a very difficult and expensive thing, even if we were sure it were practicable.

Question. What exactly are you working on?

Secretary QUARLES. In defense against ballistic missiles specifically.

Mr. McCORMICK. Without disclosing any secrets, Mr. Secretary.

Secretary QUARLES. That again is not an easy question to answer without going too far, but as I say, one has to work on improvements in radar, in the ranges at which you can detect and track objects of this kind traveling very high in space and then you have to work on missile systems that would be capable of intercepting such a weapon as it comes down. There is work along these lines going forward.

Question. Mr. Secretary, do you think something could be done about the interservice rivalry in ballistics development?

Secretary QUARLES. Well, I think first that the interservice rivalry has been greatly exaggerated in the public mind. We have tended to make this a scapegoat for the fact which people are uncomfortable about—that some other country has gotten out ahead of us in a spectacular thing like an earth satellite.

Actually there is a tremendous lot of talk in the papers about service rivalry and, to be sure, there are such rivalries, but I am not aware that they have actually delayed the programs we are talking about.

Question. Then why did the President have to appoint Mr. Killian in the event of rivalry?

Secretary QUARLES. I think the President made it very clear in appointing Dr. Killian that he wanted somebody—and we all feel that Dr. Killian is a very splendid person to get for this purpose—somebody to come down and watch this whole area of scientific research and development in relation to the Government

and defense, from the President's vantage point, and help him to take the right actions in relation to it.

Question. Mr. Secretary, I wonder if you could please tell us, sir, what exactly will Dr. Killian do? The President wasn't too specific in his powers. Will he be able to knock heads in the Pentagon and be able to get the services together?

Secretary QUARLES. Well, I don't think I can tell you what the President is going to do or just what he is going to have Dr. Killian do, because you realize that gets out of my area. However, I would assume that the President would use Dr. Killian to help him in this general area of scientific research and weapons work and help the President to cover that area of this enormously broad field that he is to cover.

Question. Then this appointment isn't just another Government appointment that we hear so much about, and that will be sort of looked over very soon. It will be an important one, then?

Secretary QUARLES. Well, I certainly think so. I don't think you could bring Dr. Killian full time down into the Government without its being important.

Question. Many of your scientists and technicians are going into industry because of low pay.

Are you considering raising their salaries to make staying in the service a more profitable career?

Secretary QUARLES. Well, I think there are some moves afoot in the Government and in Congress to increase the salaries of Government scientists, but I want you to realize that the great bulk of the scientists and engineers working in the field we have been talking about are actually the employees of industry, and not of Government.

Question. Are you considering raising the services' pay—the Army, the Navy, and the Air Force?

Secretary QUARLES. Yes, there are considerations of that kind, too, following up on what I think all of you will know as the Cordon (sic) report last summer.

Question. Mr. Secretary, with all our haste to catch up to Russia in the missiles department, why was the Army taken out of the long-range missile program after they developed the Redstone missile and the Jupiter missile?

Secretary QUARLES. The Army hasn't been taken out of the long-range missile program at all. They are still in the development work and all the development work they have ever been in, as a matter of fact.

It is true that in assignment of the mission in the armed services to use these missiles in combat, the Secretary of Defense decided that missiles of the range we are talking about—that is, beyond 1,000 miles, let us say, in range—should be the role and mission of the Air Force rather than the Army, because it involves their kind of business, so to speak.

Question. Well, why were they put right back in? According to Dr. von Braun they were taken out and later put back into the program, after which they developed the Jupiter-C missile.

Secretary QUARLES. That again, Carl, isn't quite what he said. They weren't given the assignment of putting up a satellite with the Jupiter-C rocket which they originally proposed and that was because, as I said earlier, it involved military rocketry and at that time it was felt it would involve delays in military programs. They have been put back into the satellite program in recent days.

Question. Well, Secretary Quarles, it is quite apparent that there is some rivalry between the services, and 7 years ago Dr. Killian urged there be greater coordination of the development of rockets. Why wasn't something done sooner?

Secretary QUARLES. Well, let me answer the first part of your question first. It is perfectly true that there is rivalry between the services and we have—I think you will all agree—accepted in our way of life the value of rivalry and competition, to a degree.

Now the question isn't whether there is rivalry. The question is whether it has had harmful results. As for the carrying out of Dr. Killian's recommendation some time back, I think it is a fact that there has been the kind of coordination you assume there has not been.

Question. What steps will you take in recruiting scientists?

Secretary QUARLES. Well, perhaps you mean here, into the Government service, and I again want to make it clear that this missile work that we are talking about is very largely carried out in industry and of course they have taken, as all of you know, very energetic steps to recruit scientists into these programs. And I think, generally speaking, they have been successful.

As for scientists into the Government, again I think that we are at some disadvantage because the pay scales in Government aren't quite comparable

with those in industry but nevertheless there has been quite good success, particularly in these programs that people are excited about.

Question. Mr. Secretary, do you think it would be possible to put all the missile development under one roof?

Secretary QUARLES. Under one roof?

Question. Yes, sir.

Secretary QUARLES. I know you use that word figuratively, but of course just the fact that you use it illustrates why it isn't possible. The missile work involves actually billions of dollars and that means thousands upon thousands of people working in it, and from many different branches of industry across the whole country. And when you consider the scope of the thing, you realize that while it all should be directed and coordinated, it wouldn't be possible to put it under one roof, either figuratively or literally.

Question. What about these unidentified flying objects that have been sighted all over the United States? Is this a project of our Government?

Secretary QUARLES. There have been unidentified flying objects sighted for many years and it has been one of the functions of the Department of Defense—actually the Air Force—to investigate these and they have investigated all that they have had reliable reports on and the great bulk of them have been found to have been either manmade objects that are quite explainable, or natural phenomena that usually deal with atmospheric electricity in one form or another.

Mr. McCormick. Mr. Secretary, a young lady here has seen one of these flying objects. Is that right, Sylvia?

Question. Yes.

Mr. McCormick. Where was this?

Question. Over near my house, my farm.

Secretary QUARLES. Where is that?

Question. Primrose Acres, in Annapolis.

Secretary QUARLES. Annapolis, Md.?

Question. Yes.

Secretary QUARLES. What sort of thing did you see?

Question. It appeared to me to be a flying saucer.

Mr. McCormick. Would you draw us a picture of that to give us some idea of how it looked and you might give us a description of what it looked like.

Was this at night when you saw this, Sylvia?

Question. Yes. It was sort of shaped like that [indicating].

Mr. McCormick. Like a saucer?

Question. Yes, sir; and it was laying on its side and it had a stripe like down here, and there was more of a darker shade. And then it had sort of a coral bottom. The color was bluish-white. This part right here was more of a darker bluish-white and this was lighter.

Mr. McCormick. How far off the earth was it, Sylvia?

Question. I would say 75 or 100 feet off the earth.

Mr. McCormick. Did others see this with you?

Question. Yes, sir; my girl friend, Jean Hunt. She is here today and she saw it, too.

Mr. McCormick. Mr. Secretary, we have heard all sorts of stories of this kind going on.

Isn't it difficult to disprove these things?

Secretary QUARLES. I don't think we disprove them at all. I am sure Sylvia's observations were perfectly reliable and I don't, of course know exactly what she saw. I can only say that, oh, in something between 90 and 95 percent of the cases where there has been enough information to investigate them, it has been possible to explain them quite completely and in the other cases we believe that we simply didn't have enough information about it. And to put it the other way around, we have never had any evidence that they were of extraterrestrial origin, as most people like to imagine they are.

Question. Well, sir, is the Air Force really afraid or is the Department of Defense really afraid to admit that there is a possibility that they might be something from outer space? Is it something you are holding back?

Secretary QUARLES. No, I can assure you there is nothing whatever held back. We have no fear on the subject whatever. There has never been the slightest evidence that there are objects of this kind that should cause us any fear.

Question. Then it is nothing that our Air Force or our Government has been experimenting with?

Secretary QUARLES. The things that have been observed have sometimes been experimental objects that people didn't recognize, but our Air Force, or our

Government is not experimenting with flying saucers of the kind Sylvia felt—Sylvia saw.

Question. Well, Mr. Secretary, the Air Force has always emphasized that maybe 95 percent of the objects sighted were explainable by ordinary means, but there is always that remaining percent that are never explained, and I wonder if you could give us any logical explanation. I have never heard one.

Secretary QUARLES. Well, I can only say that where you have hundreds of these things, it isn't at all surprising to me that a few of them are not described sufficiently or not enough is known about them to be able to give an explanation of them. I think that if they had any very special character you would have found that in the 95 percent that you could identify carefully.

Question. But in many cases such as one case where a pilot and his aircraft disintegrated several years ago, adequate facts were on hand, yet they still were not explained. Authorities disapproved the Air Force explanations.

Mr. McCORMICK. Dave, that is an interesting question and, Mr. Secretary, I would like to get a long answer to it but I find our time is up.

Thank you very much, Donald Quarles, Deputy Secretary of Defense, for being our guest today on Youth Wants to Know.

Now before closing may I remind you this is American Education Week and here is a brief message from the President of the United States.

President EISENHOWER. The strength of our arms is always related to the strength of our minds. Our schools are strong points in our national defense. Our schools are more important than our Nike batteries, more necessary than our radar warning nets, and more powerful even than the energy of the atom. This is true if for no other reason than that modern weapons must be manned by highly educated personnel if they are to be effective and the energy of the atom can only be understood and developed by the most highly trained minds in the country.

The ANNOUNCER. The questions you have just heard do not necessarily reflect the opinions of Youth Wants to Know, the National Broadcasting Co., or the National Education Association.

Join us again next week when Youth Wants to Know will present a special program on juvenile delinquency. Our guest will be Judge Samuel Leibowitz, an outstanding authority in this field.

QUARLES NOT HAPPY WITH MISSILE DEVELOPMENT

Senator JOHNSON. Mr. Quarles, I know you have been mindful all evening of the importance of giving to the committee the fullest and most detailed testimony and the most accurate data and candid opinions that you possess.

There are many good reasons, I think, why this should be done. There is one, however, in addition to the primary reason that our very survival could depend on it, and I would like to mention it, and that is this:

History will review what you have said here today and what you will tell us in executive session. The record of that testimony will be tested by the actual developments which the future will bring.

Now, with that in mind, Mr. Quarles, having great respect for not only your capacity but your sincerity and your devotion to the national interest as you see it, I should like to ask you this question:

As you appear before us tonight and speak to this committee and the American public, are you happy with the development of our missile program?

Mr. QUARLES. No, I am not happy with it, Mr. Chairman.

Senator JOHNSON. Is it your judgment that the certainty of success is more important than speed in scheduling production of specific missiles?

Mr. QUARLES. No, it is not my judgment that certainty of success—

Senator JOHNSON. Is it your opinion, in retrospect, that perhaps we have been too cautious too long in certain respects?

Mr. QUARLES. In respect to the long-range ballistic-missile program, Mr. Chairman, it is not my judgment that we have been too cautious; but I do not apply that across the board.

Senator JOHNSON. Would that, then, by implication, mean we have been too cautious too long in the other missile programs?

Mr. QUARLES. In the other development programs, whether missile or aircraft or other things, in some of them.

Senator JOHNSON. How much has our missile program been controlled by the policy decisions of the National Security Council?

Mr. QUARLES. Well, I think in a very broad sense, all of our programs are controlled by the Commander in Chief, and of course he gets his advice from the Security Council, so, Mr. Chairman, in that broadest sense, I think you would say they are all controlled by them.

I am not sure whether that is responsive to your question or not, though.

Senator JOHNSON. Well, let us take the Budget Bureau. How much has our missile program been controlled by the policy decisions of the Budget Bureau, in your opinion? And I would like you to speak frankly and candidly.

Mr. QUARLES. Yes.

Senator JOHNSON. Because you know what I am talking about. You know the feeling abroad in the land. You know the concern that the people feel. You know the unrest that exists right here at this committee table. And you, better than anyone I know, have had your fingers right on top of this thing, and you are the most experienced man in that Department in policymaking decisions. So if you would just let down your hair and speak fully and frankly to us, I think you could perform a great service.

Mr. QUARLES. Again, Mr. Chairman, in respect to the top priority ballistic missile program, as I think you are primarily interested in, I would say that the Budget Bureau has joined in this, I will say the spirit of this great urgency.

I should have mentioned that they have a member sitting on the ballistic missile committee operating under Mr. Holaday in his present capacity, and that member deals with Budget Bureau matters at the same time the other officials that I speak of deal with their situations.

So I think that one has to say that both in respect to the Budget Bureau and all other respects, the handling of the funding of these programs has been not only satisfactory, but has produced the greatest progress that technical limitations would permit us to produce.

Senator JOHNSON. Are you aware of any decisions in the National Security Council or in the Budget Bureau that have retarded or slowed down our development in the missile program?

Mr. QUARLES. Not in these high priority ballistic missile programs that I speak of.

There have been missile programs, certainly, that have been slowed down by fiscal considerations, and some have been canceled because of the fact that their cost was judged to be out of proportion to their values.

I do not think this was Budget Bureau, though, Mr. Chairman, in a literal sense.

Senator JOHNSON. How much is our missile program controlled by the policy decisions of the Treasury Department.

Mr. QUARLES. Well, I am not aware that they have entered into the missile programs, Mr. Chairman.

SATELLITE PROGRAM NOT SLOWED FOR LACK OF FUNDS

Senator JOHNSON. Has lack of funds had anything to do with retarding the action taken in connection with the launching of our satellite?

Mr. QUARLES. The satellite program, I think, throughout has received the funds that it requested.

There have at times been delays in granting the fund, but I believe the delays have never carried to the point where the program slowed down or stopped for lack of funds.

This is my best information.

Senator JOHNSON. Are you of the opinion that the American people are as aroused as this committee and as you are about the situation which faces us?

Mr. QUARLES. Mr. Chairman, you are in so much better position to judge that than I am. I am sure they were not so 3 months ago. Whether they are today, I really can't judge. I believe the American people, you would have to say, are not as aroused about this as we here are.

Senator JOHNSON. Well, I have my judgment on it, and I know of few things without even excepting Pearl Harbor which in my judgment have so alarmed them and so concerned them. I think we have cause for concern, but not for panic.

Mr. QUARLES. Yes, sir.

Senator JOHNSON. And I think that with the resources of this Nation if they are fully utilized and if we all close ranks and get on with the job, we will be equal to the challenge.

I appreciate the effort, capacity, devotion, and dedication that you feel, and I am grateful to you for having answered with dignity and with feeling the rather searching questions that the counsel has asked you.

Senator CASE, do you have any questions?

Senator CASE. Mr. Chairman, just a few.

Mr. Secretary, with reference to the Cordiner report and if I understood correctly, you said that there was some talk last session was not a good time for its pressing.

Would you elaborate on that a little bit to indicate what you meant?

Mr. QUARLES. Well, in the first place, Senator CASE, the matter came up—

Senator JOHNSON. I want to raise a point here. I think I ought to put it in the record. I am very anxious to see that every Senator goes into any line of inquiry he desires to pursue. I have had called to my attention by the chairman of the full committee that there is a special committee that has exclusive jurisdiction of the Cordiner report and presently has that report under consideration. That committee is headed by the distinguished Senator from Mississippi, Mr. Stennis.

Now, having pointed that out and having made it abundantly clear in the record, I think it then quite proper that the Senator from South Dakota and the Deputy Secretary exchange their viewpoints on it. I would not want the public or the chairman or the sub-

committee chairman to feel that I felt we had any legitimate jurisdiction, in view of the existence of that subcommittee. We expect to cooperate with that committee fully, as I know the Senator from South Dakota does.

Senator CASE. Yes, Mr. Chairman. The only reason I asked is because the testimony has already been offered on it here tonight, and some statement was made as to why it was not pressed at the last session. I think the phrase was "it was not considered a good time."

Mr. QUARLES. I would have to here express my own opinion, because I do not think I am in a position to say more than that. But my own opinion is that, coming up at the time that it did in the last session and in the general atmosphere in the last session with great emphasis on economy, as the Senator will remember, it was my opinion that it was not sufficiently worked out and that the time was not propitious for the administration to press it.

Senator CASE. Mr. Secretary, in your speech to the mayors, you pointed out something about that situation when you said:

First, a word about fiscal matters. The appropriations for national security have, I feel, been disappointing. The appropriations for defense account were some \$2.5 billion below the President's original budget request. The appropriations for military assistance and defense support to our allies, not including economic assistance, were some half billion less than requested, and not all of these were unilateral congressional cutbacks. Some of the cuts were accepted by the administration as the whole picture unfolded. Perhaps the most disturbing aspect of the whole matter, from my standpoint, is the change in climate from last year, when \$900 million extra was added by Congress to the defense budget to meet what Congress believed to be the national-security problem, and this year, when \$2.5 billion was cut from the budget. Fundamentally, this change in climate reflects a change in public estimates of our security position and, in my judgment, is not justified by the facts.

Was that part of the feeling at the time to which you refer?

Mr. QUARLES. That is correct, Senator Case. That speech was made pre-sputnik, and, as we have discussed here, I think that the climate of public opinion has changed very substantially since that time.

HE TRIED TO STIR UP PUBLIC INTEREST IN SUPPORT OF DEFENSE PROGRAM

Senator CASE. And what was your purpose in putting this in your speech at that time—to help change the climate?

Mr. QUARLES. My purpose in putting it in, my sole purpose in putting it in, was to try to stir up a public interest in the full support of what I considered to be a necessary defense program, and, in the climate at that time, I felt it was very necessary to bring this to the attention of the public.

Senator CASE. In your speech to the Wings Club on the 18th of November you said:

Russia alone has more than 170 divisions. Her western satellites have another 70, and the Communist Far East around 200, a grand total of around 440 divisions. When we add to this the Communist-bloc combat air strength of more than 25,000, including the most advanced types, and her 500 submarines, the largest submarine fleet in the world, we see a very formidable and immediate capability.

What was your purpose in saying that to the Wings Club?

Mr. QUARLES. My purpose, Senator Case, again was to stress the great power of the Communists, the great military power of the Communists, and the great need for this Nation to recognize that, and

recognize the rate at which it was building up, and to dedicate itself to a solid defense against it.

Senator CASE. You were attempting to arouse the country to the challenge before us?

Mr. QUARLES. I was, sir.

Senator CASE. In that same speech, you said:

It will be costly and call for sacrifices on our part in the form of personal effort on the part of some and greater tax burdens than we like to bear on the part of all. Our course seems very clear to me. We must do whatever it takes to meet this situation. We must recognize our community of interest with our free-world friends and allies. We must, collectively with them, maintain adequate deterrent forces in this. We must plan our own programs for the long pull so that military security will not be undermined by economic security. We must strengthen ourselves in the field of technical training and in basic research and, specifically, we must broaden and deepen our programs for the exploration of outer space. We have a capacity to meet this challenge and still enjoy a higher standard of living than any people have ever enjoyed. My belief is that we would want to meet the challenge even if the standard of living had to suffer.

Was that also for the purpose of arousing the people?

Mr. QUARLES. That was the purpose, sir, and my sincere effort; to state the challenge and state it in as provocative a way as I could so that the American people, who will always arise to a challenge when they see it, would rise to this one.

Senator CASE. At another point in the same speech before the Wings Club, you said:

Our concern is with the speed and scope of the Soviet progress. We must be aware of the challenge this holds for us in the future period. We, too, must push ahead on a broad front with due regard to scientific foundations for the long-range effort. As the President brought out so well in his Oklahoma City speech last week, this calls for a new look at our educational system along with increased emphasis on basic research.

Did you have the opportunity to hear or read what Dr. Teller and other witnesses before this committee have said on that matter of basic research and taking the new look at our educational system?

Mr. QUARLES. I read quite a complete newspaper account of what he said. I have not read the complete transcript, but I believe I am quite familiar with what he said, Senator CASE.

REVAMPING OF EDUCATION SYSTEM AS URGENTLY NEEDED

Senator CASE. And in your speech on November 18 to the Wings Club, you were attempting to alert the country and arouse them to the need of revamping our educational system, perhaps with more emphasis upon basic research?

Mr. QUARLES. I was doing it then and I have done it many times, and I believe sincerely, as Dr. Teller so ably brought out, that this is a very important thing to get across to the country.

Senator CASE. And you generally then endorse that idea?

Mr. QUARLES. I endorse that idea, and moreover, I endorse substantially all of Dr. Teller's recommendations.

Senator CASE. Thank you. That is all, Mr. Chairman.

Senator JOHNSON. Senator Kefauver.

Senator KEFAUVER. Thank you, Mr. Chairman and Mr. Quarles. I had a speaking engagement where my little boy was going to be present tonight, and I couldn't cancel it after this meeting was set, so I did not get to hear all of your testimony. If I ask you any

questions that you have responded to in response to questions by the counsel, you say so and I will not pursue them any further.

Mr. Quarles, did you read the article by Dr. C. C. Furnas in the October 21 issue of Life magazine?

Mr. Quarles. I did, Senator Kefauver, yes, sir.

Senator KEFAUVER. Do you agree with the facts that he states in here or with his conclusions, or do you recall all of them?

Mr. Quarles. I do not recall every one of them. I certainly agree with them in the main. I believe as I read it that there were one or two statements of fact that I was inclined to feel were not quite in accord with the record, but I would say this was minor, Senator Kefauver.

Senator KEFAUVER. Dr. Furnas was the Assistant Secretary of Defense for Research and Development from December 1955 until February of 1957, he states here.

Mr. Quarles. That is factual, I think, sir.

Senator KEFAUVER. He says in the last paragraph:

In the case of the space satellite we had the money and talent and facilities to do the job—but only in pieces, with the pieces trapped within the high fences surrounding the individual services. Unless we can devise without delay some means of putting the pieces together and keeping them together on a permanently functioning basis, I am afraid that we will soon find ourselves gaping at still further Russian triumphs.

Do you subscribe generally to that?

Mr. Quarles. Yes, sir, I subscribe generally to it and particularly to it in relation of this exploration of space field and, in fact, that is precisely the reason the Secretary of Defense has, as he announced this afternoon, decided upon a unified defense program in this area.

Senator KEFAUVER. You do feel that in the past the reason we have gotten behind and we have not made the success that we needed was that the pieces were trapped within the high fences surrounding the services, and that we were not putting the pieces together? Is that about your conclusion?

Mr. Quarles. I would have to disagree somewhat with that wording, because I am not aware of high fences around the services existing or having any such effect as might be implied here. I think that the language is colorful, but this is one of the examples where I said I think I would have had to say it a little differently.

Senator KEFAUVER. He says in the first part that the United States—I am quoting:

The United States should have been and could have been the first nation to launch a satellite. Some officials who now belittle Russia's sputnik are among those who, in the first place, were not convinced our own satellite program was worth pushing. Had they been so convinced, there is every reason to believe that a United States satellite could have been orbiting the earth as early as 1955. Instead, it was not until 1955 that a United States satellite program was even seriously discussed.

Is that true that it was not seriously discussed until 1955?

Mr. Quarles. I remember the first serious discussions as being early in calendar 1955. I think I am correct about that date.

NO INTELLIGENCE AS TO SOVIET INTEREST

Senator KEFAUVER. Was there not information from the Intelligence Service that the Soviets were going along with the satellite at least 2 years before that time?

Mr. QUARLES. To the best of my belief, there was no intelligence information at that time that the Soviets were moving into a satellite program.

There had been, let me say, speculations by scientists of many nations about the possibility of erecting satellites and the characteristics they would have, and I do not refer to such speculations because in our own country they go back many years, but I do refer to the existence of programs for the research and development and launching of satellites. And I believe it is a fact that we had no intelligence information at that time that the Soviets were doing so.

Senator KEFAUVER. He further says, in talking about the lack of interest:

Despite this lack of support, by the spring of 1955 enough high-level interest had been generated to spur Donald Quarles, then Assistant Secretary of Defense for Research and Development, to appoint a nine-man, all civilian Scientific Advisory Committee, and that he was a member of this Committee and had met several times in the spring and summer of 1955.

That was the committee that you appointed?

Mr. QUARLES. That was the so-called Stewart Committee; yes, sir.

Senator KEFAUVER. And he says here that one of the first jobs that the Stewart Committee had, or this committee, was to settle the dispute as to who should make the rocket for the launching of the satellite for the IGY, in time for IGY, the Army or the Navy, and that this was discussed some time. And the Redstone, the Army people thought they were further along in development. The Navy said it was further along in instrumentation, but its Viking missile would need a redesigned motor.

When was this matter presented to the Stewart Committee, the so-called Stewart Committee?

Mr. QUARLES. It was early in 1955, Senator Kefauver. I would have to give you the date for the record. I do not know exactly.

Senator KEFAUVER. How long was it considered in 1955 before a decision was made?

Mr. QUARLES. The whole consideration was several months, but again I will have to supply the exact answer for the record. (The Department of Defense furnished the requested information as follows:)

The Stewart Committee was given the satellite problem in July 1955. A report was made by the Committee on August 1, 1955, and the satellite program was given to the Navy in September 1955.

Senator KEFAUVER. He says here that the Committee considered the matter and, apparently, not very much was being done, either by the Navy or the Army, with their missile for the launching of the satellite during the time of consideration, and that, finally, he says, to make matters worse, they lost you as Chairman, that you became Under Secretary of Defense, and that they had a split recommendation which was handed to you, and that on this split recommendation you made the decision to give this work to the Navy and not to the Army at its Redstone Arsenal. Is that correct?

Mr. QUARLES. Yes, sir. I would like to be a little more precise about it. This Committee did make a 7-to-2 recommendation for what we now know as the Vanguard program. In view of the split, I asked our Research and Development Policy Council to review the Committee report, and the Policy Council, which consisted of the

top research and development people in all three of the services, both civilian and military, recommended that the project, that the Navy Vanguard project, as we now know it, be approved.

Again, this recommendation had a dissent from the Army members, but Defense and Air Force and Navy were in favor of that position, and, as a result, as Assistant Secretary of Defense, I recommended that position to the Secretary of Defense.

Senator KEFAUVER. Dr. Furnas says that 4 committee members felt that they should give it to the Navy; that he and another member cast a dissenting vote; and the 3 remaining members, he says, were not missile experts and decided to go along with the majority.

Anyway, when did you make the decision, Mr. Quarles, to give the missile to the Navy rather than to the Army?

Mr. QUARLES. I will have to supply that for the record, Senator Kefauver.

The Department of Defense advised that the satellite program was given to the Navy in September 1955.

Mr. QUARLES. It was right at the time that the Committee made its report and that we had the Policy Council review it. It really should not be called a decision because, of course, as Assistant Secretary, I was recommending it; but my recommendation was accepted.

Senator KEFAUVER. As I get it from this, the Committee was appointed in March 1955, and you moved up in 1955 to become Secretary of the Air Force, and then Dr. Furnas became the Chairman in 1955, in December of that year, and a decision had not been made by that time, apparently, so it must have been made after December 1955.

Mr. QUARLES. I think that is not correct, Senator Kefauver. I think the facts are that I made the recommendation before I left the Defense Department, which was in August of 1955, and the project was, in fact, accepted; my recommendation was accepted before that time.

THEY WOULD COME TO DIFFERENT DECISION TODAY

Senator KEFAUVER. You feel, Mr. Quarles, in light of the Navy's failure to develop the Viking and get a missile up by this time, that that was a wise decision?

Mr. QUARLES. As well as I can judge today, the finding that the Navy had the best chance to do it with the technology they proposed would not be the finding of the same technical committee if it reviewed the matter again today.

Senator KEFAUVER. You mean if you reviewed it again today they would have decided in favor of the Redstone?

Mr. QUARLES. I think they would have, and I, of course, would have agreed, would have concurred in their recommendation. Of course, this admits that much new information has been added to what was available to them at that time.

Senator KEFAUVER. Were not the Redstone people claiming that, within 6 or 7 weeks, if given sufficient emphasis even back in the early part of 1955, they could have a satellite in orbit?

Mr. QUARLES. No, sir. I think they were not. I think the orbiter program, which was the Redstone program at that time, was proposed, and this was in, let us say, March or April of 1955. The earliest

date that they were willing to talk about was 18 months to 2 years after that.

Senator KEFAUVER. Eighteen months would have been the early part of 1957.

Mr. QUARLES. It would; yes, sir. And the Navy talked about the same time.

Senator KEFAUVER. The Navy has not done so well. They have had a lot of bad mishaps.

Mr. QUARLES. I would not like to agree that they have not done so well. I think what happened there was that the Navy, under pressure of the scientific community who were trying to get more and more instrumentation in the satellites, undertook a bit more than the technology immediately available justified, and, as a result, they have had delays in their program.

Senator KEFAUVER. Mr. Quarles, when you decided that the Redstone Arsenal was not going to go on with its Jupiter, they substantially stopped work on it at that time, did they not?

Mr. QUARLES. Well, I think it would appear from the present record that some things continued to happen, Senator Kefauver.

Senator KEFAUVER. I know, but I mean very little was done from the latter part of 1955 until just here recently when it was reactivated.

ARMY FAILED TO GET PRIORITY FOR SATELLITE

Mr. QUARLES. Well, no, sir. What I meant to imply was this; that they did have continuing rocket programs, and, for technical reasons that would take some time to explain, they found that continued work on what we now call Jupiter-C system was a convenient thing to do in their other programs. So, actually, they have advanced the Jupiter-C program right up to the present time.

Senator KEFAUVER. But they were not given the priority to go ahead with their Jupiter program and to push it for the purpose of getting a satellite launched?

Mr. QUARLES. No; they were not, sir.

Senator KEFAUVER. But now the program has been revived and their schedule is January or sometime like that?

Mr. QUARLES. They have talked about the possibility of getting one up. I think February is the earliest date they now expect.

Senator KEFAUVER. And Mr. Wilson limited the Army to a 200-mile missile, in that category?

Mr. QUARLES. Not precisely; no, sir. The Army was authorized the development of a missile of 200-mile range as part of the Redstone missile program, but the Army was also authorized the development of a 1,500-mile Jupiter missile, and it has been on that top priority since that authorization, which took place in the late fall of 1955.

Senator KEFAUVER. Do you believe, Mr. Quarles, that, as you now say, if you had the facts, a different decision would have been reached; that it was this decision that resulted in the Russians launching their satellite before we did? If the decision had been otherwise, we would have had one up 8 months before they did?

Mr. QUARLES. I think that, if the decision had been the other way, they might very possibly, the Army might very possibly, have launched one first. I must say, however, that the Navy proposed, itself, the same program of launching as the Army, and we were talking about

speculation when we say that one would have done it when the other did not.

Senator KEFAUVER. Mr. Quarles, you have had the money, and I always wondered why you did not let both programs go on. Both of them thought they had good programs. Why did you not let both programs? You had enough money to do it. Why did you have to decide between them?

Mr. QUARLES. Well, Senator Kefauver, when you say we had enough money, I think back to the very difficult atmosphere at that time of getting anybody to be interested enough in the project to put any money in it whatever.

Senator KEFAUVER. Tell us more about that. Who was not interested, Mr. Quarles?

Mr. QUARLES. I would say that it started with the public and went pretty much across the board at that time.

The Navy's estimate of the cost of the program was \$10 million.

After looking around, we came to the conclusion that they had been unduly conservative and doubled the amount.

The program is now costing \$110 million. This illustrates the difficulty at that stage in telling just what costs are going to be. And at that time, even the \$20 million cost which was estimated was a cost of which many people wondered about the justification.

Senator KEFAUVER. It says here that you told the committee that there was \$20 million available in the Department's emergency research and development fund, and the conclusion is that there was enough money for both the programs to go ahead.

Mr. QUARLES. There was \$20 million available, made available from the research and development fund.

As I have attempted to bring out, though, Senator Kefauver, this proved to be grossly inadequate, even for one program.

Senator KEFAUVER. You said that there just was not enough interest, Mr. Quarles. But I suppose we all did not know enough about it and were all complacent.

Senator Byrd read the record here that Congress had appropriated everything you asked for for satellites and missiles.

Where was the principal lack of interest? I do not think you can say it was in the Congress, because we appropriated all the money that you suggested or asked for.

Mr. QUARLES. I think that Senator Byrd was speaking about appropriations in a much larger sense than this particular project.

This particular project did not come up for appropriation until the fiscal year 1956, fiscal year 1956 budget was presented.

At that time, there was only a very modest amount of appropriation for this program. I do not remember what it was but it was small, and pretty much escaped notice, I think, in the Congress at that time.

Senator KEFAUVER. Mr. Chairman, I would like, since I have referred to parts of this article, that it be printed in the record.

Senator JOHNSON. Without objection, that will be done.

(The article referred to is as follows:)

WHY DID THE UNITED STATES LOSE THE RACE?—CRITICS SPEAK UP

Text by Dr. C. C. Furnas

Dr. C. C. Furnas, a chemical engineer and expert on guided missiles, served as Assistant Secretary of Defense for Research and Development from December 1955 until February 1957. In that position and as a member of many scientific advisory committees, he has observed the progress of the United States satellite program at all levels. Now returned to his post as chancellor of the University of Buffalo, Dr. Furnas last week gave Life this exclusive and critical report on why the United States satellite has not yet been launched.

The United States should have been and could have been the first nation to launch a satellite. Some officials who now belittle Russia's sputnik are among those who, in the first place, were not convinced our own satellite program was worth pushing. Had they been so convinced, there is every reason to believe that a United States satellite could have been orbiting the earth as early as 1955. Instead, it was not until 1955 that a United States satellite program was even seriously discussed. But, with vigor and determination, even at that late date we might still have got our moon up there first. We had the brains, we had the know-how, we had the money. Why, then, did we not get the first satellite?

All too frequently it has been the view of our Defense Establishment that research not directly related to the development of military hardware is entitled to only secondary consideration. It has been regarded as a sort of extracurricular scientific pastime to be indulged in only if money is left over from the really important things.

This is a tragically naive and shortsighted outlook. Every scientist knows that a single fruitful concept can render an entire weapons program obsolete and open up a host of new possibilities to explore. Out of the basic experiments on aerodynamic forces by the Wright brothers and Langley came the age of aircraft and missiles. Out of Hans Bethe's abstruse calculations on the nature of the sun's energy came the hydrogen bomb. In the case of the satellite, it was the then Defense Secretary Charles Wilson's contention (and still is, judging from his latest public pronouncements) that, while a satellite is a nice scientific trick, it has no real military value. Therefore, why spend military money on it?

It was not that our Defense Department lacked the money. It lacked only the interest. The Pentagon seemed unable to see the obvious military advantages of a satellite, even though some scientists and officers in the military forces were most vocal in pointing them out more than a decade ago.

In 1954, after plans got underway for the International Geophysical Year, an urgent interest in an American satellite was expressed by the National Academy of Sciences, sponsoring agency for the United States IGY program. But the Academy had no money. It turned for help to the National Science Foundation, the agency created by Congress to encourage basic research. But the Foundation's funds were puny compared to the magnitude of the task, and Congress showed no disposition to appropriate more. Despite this lack of support, by the spring of 1955 enough high-level interest had been generated to spur Donald Quarles, then Assistant Secretary of Defense for Research and Development, to appoint a nine-man, all-civilian Scientific Advisory Committee. I was a member of this Committee, which met several times during the spring and summer of 1955.

First, we were asked to decide on the feasibility of launching a satellite in time for IGY (mid-1957 to the end of 1958). We were well aware of many thorny problems which had to be solved. Nevertheless, we agreed that there was a reasonable hope of doing this if the personnel, facilities, and funds were granted on a high-priority basis. Next, Mr. Quarles told us there was \$20 million available in the Defense Department's emergency research-and-development fund. Would that be sufficient to do the job? Our answer was a unanimous, resounding "No." We all agreed that several times that amount would be required for the project.

Finally, we were asked to select 1 of 3 service satellite proposals: (1) The Army believed that its giant Redstone missile could be perfected as a launching vehicle within a year and that its scientists could develop the satellite and instruments in time for IGY. (2) The Navy was much farther ahead in instrumentation, but its Viking missile would need a redesigned motor with added thrust in order to lift the satellite high enough and fast enough. (3) The Air Force offered the mighty Atlas missile, but it was cautious about promising any definite delivery date.

The Committee toyed with plans for combining the best features of all three proposals—for example, trying to use the Army's farthest advanced missile to launch the Navy's farthest advanced satellite instruments. But putting together parts of the separate systems involved certain difficulties, technical and administrative. I recalled, for example, sitting in on earlier meetings as Chairman of the Guided Missiles Committee of the Research and Development Board. We tried

to persuade the Navy and Air Force to combine their skills in producing a single 500-mile range, subsonic, surface-to-surface missile. Each service thought a single missile was a fine idea. But if there was to be but one missile the Navy thought it should be the Navy's and the Air Force thought it should be the Air Force's. As a consequence, we have two such missiles—the Air Force's Matador and the Navy's Regulus.

All of us had had similar experiences with the military services. We were familiar with the rivalries and jealousies that would cause delay and frustration. We knew of the unwillingness of one branch of service to contribute personnel, money—or even information, at times—to a project for which some other branch would get the most credit. We all felt that a joint-effort satellite would take a long time to get off the ground, much less reach outer space. We finally decided that breaking the space barrier would be an easier task than breaking the inter-service barrier. If the job was to get done in a hurry, it had to go to a single branch of service.

Once this was decided, the assignment was a tossup between the Army and the Navy plans. Four Committee members felt it would be wisest to take advantage of the Navy's lead in satellite instrumentation and trust that the needed power could be built into the Navy missile in time for IGY. But one other member and myself cast dissenting votes. We felt that the Army's advanced rocketry would make possible an earlier satellite launching. The remaining three members said that, since they were not missile experts, they would go along with the majority. Quarles was handed this split recommendation. After a careful study, he assigned the job to the Navy, and it became known as Project Vanguard. Quarles' decision was purely technical. No politics were involved.

From the beginning we were stymied by the chronic monetary constipation of the Armed Forces wherever expenditures which they consider nonmilitary are concerned. Money was squeezed from odd corners of the various military budgets, and we got all the help which the National Science Foundation could give us. But the funds were dribbled out in such a manner that work was often slowed up for weeks and months at a time.

Then a new blow fell. In the original budget discussions, we had understood that, whenever we used the facilities of the Army, Navy, or Air Force, they would absorb the housekeeping expenses. But, meanwhile, there had been a drastic revision of the military accounting system. As a result, when we used, say, Patrick Air Force Base in Florida for a missile test, we had to pay rent for use of the missile range and also pay the cost of all the personnel and equipment we needed. These enormous, unexpected expenses raised havoc with our already tight budget.

To make matters worse, the program lost the leadership of Quarles, who moved up in August 1955 to become Secretary of the Air Force. For several months there was only an Acting Assistant Secretary for Research and Development in Quarles' place. Then in December I took over the job. Sitting in his seat, I got an even better insight into the difficulties of reconciling the numerous inter-service rivalries. It was during this period, for example, that the well-publicized row occurred over whether the Nike or Talos should be our standard antiaircraft missile. The Army pushed the Nike, but the Air Force insisted on using the Talos to defend its SAC bases. The matter was finally solved, not by dropping one of the missiles but by assigning the Army responsibility for both. (There was still a third one—a special Navy Talos for shipboard launching.) As Quarles' successor, I also had jurisdiction over the satellite program, but it never did receive the high-priority status it would have needed to get it into its orbit before the Russian sputnik.

Let us not pretend that sputnik is anything but a defeat for the United States. During World War II, when officials were trying to make light of a discouraging setback in the Burma campaign, General Joe Stilwell said impatiently, "I claim we got a hell of a beating." We might as well make the same admission regarding the Russian satellite. We did, however, go back and win in Burma. In order to go back and win the race for scientific supremacy, there are some things we must do.

We must revise our naive attitude toward basic research. The Armed Forces must understand that money spent on background research is not money thrown away. And Congress, now that it has created the National Science Foundation, should have the courage to vote it the funds it needs to carry out its many important programs.

We must give much more aid and encouragement to our educational institutions in turning out more engineers and scientists, especially at the graduate level.

We must change our public attitude toward science and scientists. At a time when Russia was building a scientific elite, we were treating our patriotic scientists

with hostility and suspicion. No one can accurately estimate the amount of damage that was done.

Finally, we must somehow reorganize the obsolete administrative structure of the armed services. There is no reason why a civilized nation should not be able to use all the money and all the talent and all the facilities of all its branches of military service on those programs which it decides are consistent with the best national interests. In the case of the space satellite we had the money and talent and facilities to do the job—but only in pieces, with the pieces trapped within the high fences surrounding the individual services. Unless we can devise without delay some means of putting the pieces together and keeping them together on a permanently functioning basis, I am afraid that we will soon find ourselves gaping at still further Russian triumphs.

Senator KEFAUVER. Thank you, Mr. Quarles.

Senator JOHNSON. The Chair will declare a 5-minute recess, and we will resume in 5 minutes.

(Whereupon, a short recess was taken.)

Senator JOHNSON. The committee will come to order.

Senator STENNIS, do you have questions you desire to ask?

Senator STENNIS. Mr. Chairman, I followed Secretary Quarles' testimony, and I waive my privilege to examine him. He has covered the matters I was interested in.

Senator JOHNSON. Senator Symington?

Senator SYMINGTON. Mr. Secretary, it is good to see you again.

Mr. QUARLES. Thank you, sir. I am happy to be here.

Senator SYMINGTON. I am a little wobbly because of the lateness of the hour.

Mr. WEISL. I think the witness is wobbly, too.

Mr. QUARLES. I am afraid so.

Senator SYMINGTON. In 1953 we had the so-called New Look, a \$7 billion cut, did we not, at that time, and we have constantly been shifting the plan for defense since that time, with adjustments down made pretty regularly. Is that about right?

Mr. QUARLES. I would comment it seems to me, Senator Symington, we have not been constantly shifting, because we held the objectives for quite a period with considerable stability. I will agree, though, that we have made, particularly recently, some substantial shifts.

Senator SYMINGTON. For instance, the fiscal year 1953 budget for research and development was \$525 million; for 1954 it was \$475 million; for 1955, \$431 million; and then we shifted accounting procedure.

But it has been my impression—especially considering the lightening of the dollar—that we have been steadily going down, have we not, so far as our expenditures are concerned in that field?

Mr. QUARLES. Senator Symington, I think the figures the Senator was reading are Air Force research and development budgets in those particular years.

Senator SYMINGTON. That is right.

Mr. QUARLES. And I note that these were the 600 account parts of the research and development budget, and also that if one takes the whole research and development expense in these years—in fact, right through this period—there would be a rising total of support for research and development. But I do not mean really to cite that as any exception to the Senator's point.

Senator SYMINGTON. Mr. Secretary, I was impressed with the able counsel's recitation of some of these statements you made in the past; and, as we have discussed before, they have worried me also.

I would like to run over a few of those from the standpoint of the record.

September 11, 1955, you said:

I think that, broadly speaking, the armed services are closer today to a unified consolidated operation than within my knowledge they ever have been.

Would you still feel that way about it?

Mr. QUARLES. I think they were closer than they ever had been. I concede your point that they still were not very close.

CAN'T SAY WHO IS AHEAD ON MISSILES

Senator SYMINGTON. Then, on November 12, 1955, you said:

The United States is ahead of the Communists in the intercontinental missiles race.

I understand you still felt that way when I was out of the room tonight; is that correct?

Mr. QUARLES. No, sir; it is not quite correct, because I mean to say as to my present feeling—I am not questioning the earlier statement—but my present feeling would be that at least I could not with assurance say that either is ahead at this time.

I do not believe that even if a person knew everything about both programs, he could answer that question.

Senator SYMINGTON. I understood that you said tonight our missile program overall is ahead of the Soviets.

Mr. QUARLES. Oh, excuse me. I did say "our missile program," but I did not say our intercontinental ballistic missile program.

Senator SYMINGTON. What do you mean by "our missile program" overall?

Mr. QUARLES. We have some several dozen, two or three dozen missile projects. And taking them all and giving them their proper relative weights, I would say that our program is ahead of their program.

Senator SYMINGTON. You mean ground to air, and air to air?

Mr. QUARLES. Yes.

Senator SYMINGTON. Falcon, Nike, those kind of things?

Mr. QUARLES. All of them; yes, sir.

Senator SYMINGTON. And then on December 3, 1955, you said:

The Soviets have more airplanes but we are superior in the number and variety of atomic weapons and the aircraft required to deliver them.

Quarles said "The 137-wing goal is 'sound.'"

That is from the Air Force Times.

Do you feel the heavy reduction in that program is also sound, from 137 wings?

Mr. QUARLES. I think the reduction in the 137-wing program under present circumstances is a sound program; yes, sir.

I would add to that that the amount of the reduction, looking ahead, is something that I still worry about. So I do not mean to be endorsing that as a future view, but just as of the present time.

Senator SYMINGTON. You say later on, in 1956—

The Russians today have plenty of medium-range bombers and have all of the bases in Europe that we are talking about are within their range and that have the capability of delivering atomic bombs against bases with more precision than we expect them to have with ballistic missiles for some time to come.

Therefore, they know and we know that the mere addition to their arsenal of a 1,500-mile missile to do the same job would not materially affect the balance of power between the two blocs.

Do you still feel that way about it?

Mr. QUARLES. Yes, sir; I do. I, however, would like to put that discussion in context, because I think the Senator will recall that there were some misinterpretations of intelligence at that time about Russian ballistic-missile work and the state of advancement of the work, and you will recall that this testimony was in connection with that general discussion.

Senator SYMINGTON. To be frank, I did not recall it, but would you put in the record any additions to the statement you would like to have, so that it would not be considered out of context?

Mr. QUARLES. I think I have said all I need to say in that connection, Senator.

WEATHER ELEMENT WAS CONSIDERED

Senator SYMINGTON. You give no weather advantage to the missile? We never had one bombing raid turned back by enemy action in World War II, but a great many turned back by weather. How about weather with a manned bomber as compared to a missile.

Mr. QUARLES. My statement was taking into consideration all factors, including weather; that is right.

Senator SYMINGTON. Then, on March 22, 1956, you said:

While it is our estimate that we are ahead of the Soviets in the guided-missile field as a whole, we know that they have emphasized the ballistic lines. We could not be surprised to find close competition in this field. We are not inclined to view the ballistic missile as more than an important addition to the arsenal.

Do you still feel that way about it?

Mr. QUARLES. I think there are two parts to that question. First, as to our relative position, and I think the words that you have quoted me saying at that time about our relative position are almost exactly the same as the words I used tonight about our relative position.

As to the importance of ballistic missiles in the whole picture, I still do feel the way I did then. But, in order not to have it taken out of context, I would like to explain why, which I did at that time, and my reason at that time was that both we and they had very powerful bomber forces with the capability of delivering atomic weapons to every place that one of these ballistic missiles could deliver an atomic weapon. And, for the time that one could see ahead, the manned bomber would be the more effective way of delivering such weapons.

And that is why I felt that the addition of a ballistic missile to do the same job was an addition to the arsenal, but not a revolutionary change.

Senator SYMINGTON. In 1957, before the House, you said:

The budget estimates for the fiscal year 1958 will, in my opinion, provide the Air Force with the funds required to maintain that deterrent strength and to improve its effectiveness.

That budget has been reduced. How do you feel about it now?

Mr. QUARLES. This was the presentation of the Air Force budget for fiscal 1958, Senator Symington?

Senator SYMINGTON. Right.

Mr. QUARLES. This was then made before—I was trying to get the time fixed in my mind.

The fiscal 1958 budget, I was principally discussing before the Congress after I moved over as Deputy Secretary of Defense. However, I do agree that the statement was made in relation to the Air Force program as it was presented at that time.

Senator SYMINGTON. On Meet the Press, on February 10, 1957, the question was asked you:

Mr. Secretary, leaving the budget for a moment—I am sure we will come back to it—your successor as the Assistant Secretary of Defense for Research said this week that Russia was still a long way behind this country, technologically, specifically in missiles.

Do you accept that statement?

You said:

I do. As a broad generalization, I think that is exactly right.

Do you still hold that opinion?

Mr. QUARLES. I still hold the opinion that in missiles as a broad generalization—and here I am speaking of the whole field and not long-range ballistic missiles—I still hold that opinion. I would say that, perhaps, one would have to modify the spread between their capability and ours. It is not as great today as it was at that time.

Senator SYMINGTON. Then, 5 days later, at the Jet Age Conference here in Washington, you said:

Our fiscal year 1958 budget will also provide for continued high-priority support of our ballistic-missile program. I am glad to report that our progress in this area has been very satisfactory, and that we feel these highly accelerated programs are on schedule.

Do you feel that way about it now?

Mr. QUARLES. Yes, sir; I feel that all those statements are correct.

Senator SYMINGTON. On October 14, 1957, you said:

In view of our own powerful air atomic deterrent forces, we can discount much of the Soviet propaganda, and we should find no cause for alarm in the launching of a sputnik or the announcement of the test of an intercontinental ballistic missile.

Do you still feel that way about it now?

Mr. QUARLES. "Cause for alarm," taken literally, I do feel that way; yes, sir.

Senator SYMINGTON. There are some other quotes here that have been given. You say in Air Force hearings, page 1559:

My opinion is that the strategic capability of the United States will still be superior to that of any other country in the year 1960, according to our present best estimates of the courses of action of the countries involved.

Do you still feel that way now?

Mr. QUARLES. Yes; I do. Yes, sir.

Senator SYMINGTON. On April 25, 1956, before the Airpower Subcommittee, I asked a question of General LeMay:

On the basis of the present program, as you understand it, and as you get intelligence on Russia, on the basis of what you know and are told about our own program, do you believe that condition will continue in the next 3, 4, or 5 years?

General LeMay said:

No, sir; I think the situation is deteriorating, that is, our relative strength vis-a-vis Russia.

Senator SYMINGTON. Do you think it is deteriorating very rapidly under the present programs?

General LeMay. Yes; I do.

I think it is fair to say that you are in disagreement there with General LeMay, are you not? You would probably remember that testimony.

Mr. QUARLES. I remember it very well; yes, Senator, and I also remember the context. The question precisely, as I remember it, to General LeMay, was in the context of certain assumptions that you asked him to make, and, on the basis of those assumptions, I feel his answer was correct. However, those assumptions proved not to have been valid, because they were stated in terms of the programs as he at that time knew them, and the programs that he was talking about were not the programs that we proceeded with on the B-52 bomber which was the matter of principal concern.

Senator SYMINGTON. What were the programs that you proceeded with in April?

STATEMENT INCLUDED ASSUMPTION AS TO RUSSIAN PRODUCTION

Mr. QUARLES. I would have to examine that to remember precisely because it goes back a way, but it was to this general effect: that when General LeMay came in, he was testifying on the basis of the last advice he had received as to the programs for the production of the B-52 bombers. This last advice that he had received proved not to have been the last Air Force decision in the matter, and not to have been the rate of production that we did in fact achieve.

Moreover, you asked him in the context of the then expected production of Russian Bisons, which he answered in the context of your question. But it has later developed that the production of Russian Bisons was by no means as great as it was at that time assumed.

Senator SYMINGTON. I think you are extrapolating a little far, if I may say so, in what he said and what I asked.

Senator Duff asked:

I would like to ask one question. Is it not true that we have the present capacity both in hardware and in personnel to make a completely catastrophic attack on the enemy in the way of retaliation?

General LEMAY. Yes, sir. I think that if war would come today, that we would do very well.

Senator DUFF. That is what I wanted to ask.

Senator SYMINGTON. I would like to ask this question. How much would that depend upon whether we in turn were hit suddenly without warning in a devastating atomic attack?

General LEMAY. If we got a complete surprise, as you saw by ability to survive a surprise attack, we would suffer very great damage. If it were down near that zero point, as you noticed on the charts, we would not have very much left. However, I do not believe it will happen that way. I answered the Senator's question on the assumption of a reasonable method of a war breaking out. Under those conditions, and they are not to our disadvantage, I think we would do very well.

That is all that has to do on this subject. Then I asked:

On the basis of the present program as you understand it and as you get intelligence on Russia.

Since that time we heavily cut our production of B-52's for SAC. We heavily cut our production planning for KC-135's for SAC. We heavily cut our maintenance and operations for SAC, and we heavily cut the research and development incident to SAC. And so if there was any difference of opinion between you and General LeMay, that would be increased now instead of reduced, would it not?

Mr. QUARLES. I am sure the Senator would want me to be sure about his statements of fact there. We were dealing with a program of the production of B-52 bombers which was subsequent to that time increased, and subsequent to that time again was held at a level of 15 a month where it is today. So that the first assumption that General LeMay was going on was not in accordance with the facts as they developed.

The second assumption that he was going on about the rate of production of Russian Bisons has also proved to be far from the facts, and I think you will recall, sir, that you asked him to answer your question on the basis of those assumptions.

Senator SYMINGTON. Let me get it straight. Are you saying that we have not cut back in 1957, that we have not cut back our planned production of B-52's, that we have not cut back our planned production of KC-135's, that we have not cut back our maintenance and operation funds and that we have not cut back some of our research and development for SAC?

Mr. QUARLES. You are asking me a good many questions. Let me take them one at a time.

Senator SYMINGTON. Let us take the 52's first.

Mr. QUARLES. All right. The facts in the case of the 52's are that we at the time of your inquiry and the particular part of the investigation that you are speaking of had a program for the buildup of B-52's to 17 a month at a date which I cannot at this time state, but which was approximately October of this present year. Subsequent to that time we increased the rate and speed of buildup of B-52 production to a rate of 20 a month which was scheduled to be effected in December of this year.

Last summer I explained to you and the committee that for what we felt were good and sufficient reasons, and for what I believe the Congress agreed were good and sufficient reasons, we would hold the rate of production of B-52's to 15 a month, which we reached last July.

Now, I agree that subsequent to that time we have both increased and decreased the planned level of production of B-52's.

The same thing applies to the planned level and speed of buildup of production of KC-135 tankers.

Senator SYMINGTON. You have me mixed up, and I thought I knew something about it when I asked the question. What Secretary McNeil called the rigid fiscal ceiling of expenditures of \$38 billion in the year planned for the fiscal year 1958—did that affect in any way B-52 production, production plans?

Mr. QUARLES. The plan for the decrease, for the holding of B-52 production to 15 a month was presented before the discussion of the ceiling and was presented on its merits as the soundest plan for the production of these bombers.

Senator SYMINGTON. Let me ask the question again and I would respectfully request you to be responsive to the question. Did the fiscal ceiling of \$38 billion that was established in the fiscal year 1958 by the Bureau of the Budget and the Department of Defense or by the Department of Defense alone, affect the planned production of B-52's?

Mr. QUARLES. I think you would have to say that it had an effect on the planned production, because it had an effect on our whole program, yes, sir.

Senator SYMINGTON. Thank you, sir. Did it affect the planned production of the KC-135's?

Mr. QUARLES. In that same sense it did, yes. The KC-135 change was, in a sense, keyed to the B-52 change because the reduction in one made it appropriate to reduce the other; but in that indirect sense the answer is yes.

Senator SYMINGTON. I do not see what is indirect about first placing a ceiling on production, and then reducing your production planning in order to conform to the ceiling, but you can word it any way you want. Now, did the \$38 billion expenditure ceiling affect in any way the maintenance and operation funds for SAC in fiscal year 1958, that we are in today?

MAINTENANCE AND OPERATION FUNDS INCREASED

Mr. QUARLES. The appropriation for maintenance and operations of the Air Force in fiscal 1958, according to my best memory, was in excess by a substantial amount of the appropriation for the same account in the previous year. The apportionment of that within the Air Force to the Strategic Air Command, I cannot testify to. It was an Air Force action after I left the Air Force.

I will be very glad to supply that for the record, but I think I know that it was a larger apportionment in 1958 than 1957, which seems to me not to justify the inference that it was cut back.

(The Department of Defense furnished the information on operation and maintenance funds as follows:)

Operation and maintenance funds allocated to SAC have increased markedly in recent years, as follows (in millions of dollars):

SAC allocation

Fiscal year 1956-----	\$381.0
Fiscal year 1957-----	435.6
Fiscal year 1958 (preliminary)-----	550.0-575.0

Senator SYMINGTON. May I repeat my question?

Mr. QUARLES. Certainly.

Senator SYMINGTON. Did the fiscal ceiling, the rigid fiscal ceiling established by the powers that be in the Department of Defense for the fiscal year 1958, affect the amount of money that was to be expended for maintenance and operations in SAC?

Mr. QUARLES. Senator Symington, there has been no rigid ceiling of any kind, as witness the fact that the so-called ceiling has been raised, so I cannot answer that question. I do not know the answer.

Senator SYMINGTON. It has been raised since when?

Mr. QUARLES. It has been raised within the last 2 months, perhaps 6 weeks. I do not remember the date.

Senator SYMINGTON. And how was it raised?

Mr. QUARLES. It was raised by an administration agreement that the budget we had regarded as a \$38 billion figure might be a \$38.4 billion figure at the calendar year end—I should have said \$38 billion all the way through—and \$38.6 billion to \$38.7 billion figure at the year end.

Senator SYMINGTON. Are you referring to the \$400 million that was agreed by the new Secretary of Defense that would be allowed to pay bills to industry?

Mr. QUARLES. I am referring to the additional \$400 million expenditure allowance, and it certainly would be used, in considerable part, to pay bills.

Senator SYMINGTON. What has that got to do with the maintenance and operation ceiling that was established on SAC?

Mr. QUARLES. I did not relate it to the maintenance and operations ceiling established on SAC. I think it probably did have some bearing upon it, because, had it been necessary to meet the original ceiling, it would have been necessary to cut back on the use of maintenance and operation funds. However, I cited it merely as evidence that there was no rigid ceiling, and not in response to a question about the maintenance and operation funds of SAC.

Senator SYMINGTON. The testimony of the Comptroller of the Defense Department was that there has always been ceilings, and this year there was a rigid ceiling of \$38 billion, and, if you were referring to the \$400 million that was granted recently to industry in order to help them with the problem created by holding up funds, that is one thing, and is not pertinent to what I said. I was referring to the ceiling maintained on maintenance and operation funds in SAC.

Let me ask this question: As a result of the \$38 billion ceiling, were there any reductions in expenditures in SAC? Were there any ceilings established on research and development funds for SAC? For example, the B-58?

Mr. QUARLES. Those are questions, Senator Symington, that deal with the Air Force program, and the details I have not followed since I left the Air Force. I will be glad to supply that for the record.

(Department of Defense memorandum on limitation of funds for the Strategic Air Command is as follows:)

LIMITATIONS ON FUNDS FOR THE STRATEGIC AIR COMMAND

No rigid, overall expenditure ceiling was imposed by the Air Force affecting procurement, research and development, and other aspects of Strategic Air Command missions as part of the effort to keep expenditures for fiscal year 1958 within the total amount allocated to the Air Force. The Air Force did, however, establish expenditure ceilings for all commands, including SAC, for funds specifically allocated to each command. In November 1957, these ceilings were rescinded and superseded by expenditure objectives.

Senator SYMINGTON. Thank you, Mr. Secretary. Do you know where the figure of \$5 billion a year for research and development the President used it in his last 2 television talks came from?

PRESIDENT USED SOUND FIGURE FOR RESEARCH AND DEVELOPMENT

Mr. QUARLES. I know it came from the Department of Defense, and I know it represented a careful tabulation of the costs that related to research and development in the three military departments. I have, myself, reviewed the figure, and I am satisfied that it is a reasonable and sound figure, and you may recall that it had been discussed with the Congress on a number of occasions, including the presentation of the budget last year.

Senator SYMINGTON. Well, now, the fiscal year 1957 figure for research and development expenditures for the entire Department of Defense was submitted to the Congress as \$1,686 million; which figure do you think is right? Is that figure right, or is the \$5 billion plus, \$5,039 million, figure right?

Mr. QUARLES. I do not think it is a matter of rightness there, Senator Symington. It is a matter of definition and, as I have, and each time I have testified on the subject, made it very clear, I think that in the appropriation account for research and development the \$1.6 billion figure is correct. In the context of the total cost of conducting these research and development programs in Defense, the \$5.2 billion figure is correct, and the \$5.2 billion figure includes support of research and development project from other accounts.

Senator SYMINGTON. Do you consider the procurement of aircraft research and development funds?

Mr. QUARLES. I consider the procurement of aircraft through the time that they are experimental aircraft for development purposes as being research and development in this broad sense.

Senator SYMINGTON. Well, I could break down that figure of \$5,039 million, which is so much higher than the research and development figure submitted to the Congress. For example, it includes salaries for administrative personnel; the costs for cutting lawns on bases where research and development activities also existed; guards and administrative facilities for air-defense units which happened to be tenanted at research and development centers; operation and maintenance costs of military ships, aircraft, and troop units used in conducting tests; and even regular military costs associated with operation and training units in the process of phasing out obsolete weapons and phasing in new weapons.

The Bureau of the Budget has just issued a document which lists actual expenditures for 1957. In this document one of the headings was "Military construction, Reserve components, research and development, and other."

The total expenditure, as I say, was \$5,039 million.

In round numbers, this document breaks down the amounts into \$2 billion for military construction of your \$5.039 billion; \$1 billion for Reserve components; \$1.5 billion for research and development; and half a billion for "Other."

Mr. QUARLES. \$1 billion for Reserve components, Senator Symington? I think there must be some error there.

Senator SYMINGTON. Yes.

Mr. QUARLES. I think also it is not a fact that there is \$2 billion in that \$5 billion account, in the \$5.2 billion figure.

There is, however, a substantial amount of construction for research and development facilities.

Senator SYMINGTON. Well, I have had the best accountant I could get go into this figure in detail. He says it could be \$4 billion, \$6 billion, \$7 billion, the way it is figured, or any figure you might want to give. But the facts are that when you submitted the figures to the Congress you submitted \$1,686 million; isn't that correct?

Mr. QUARLES. We submitted \$1,686 million as the requested appropriation for research and development in the appropriation accounting sense; yes, sir.

HOLADAY'S AUTHORITY

Senator SYMINGTON. Now, I just want to pursue several more questions on this question of organization.

Counsel was interested in that phase and so was the Senator from Tennessee.

Can Secretary Holaday give instructions on missiles to the Secretary of the Air Force?

Mr. QUARLES. My answer to that is "Yes."

Senator SYMINGTON. Is that clear in the organizational understanding now in the Department of Defense?

Mr. QUARLES. I believe it is, Senator. What is clear is a little bit hard to say, but in my best information it is clear.

Senator SYMINGTON. Then you would say that Mr. Holaday is in direct charge of the missile programs of the Army, the Navy, and the Air Force; is that correct—power delegated to him by the Secretary of Defense, and that his authority supersedes that of the Secretary of the Air Force, the Secretary of the Navy, and the Secretary of the Army?

Mr. QUARLES. No. You have used a number of words that I did not use—

Senator SYMINGTON. I did not say—

Mr. QUARLES. That did not apply, Senator Symington. The words "direct charge" bother me a little bit. He has the responsible direction of the programs in all of the departments. With that responsibility he can give instruction to the departments in respect to their programs and does, in fact, do so.

I am not sure whether I have completely answered your question, but I have tried to.

Senator SYMINGTON. I think you offer a distinction without a difference. What we have been trying to find out for some hours in these hearings is, is there a direct authority which extends to the three services; one man in charge of the missile program? As I understand your testimony here, there is, and the control of the programs on missiles in the Army, Navy, and Air Force is in the hands of one man; is that correct?

Mr. QUARLES. The direction of the program is in the hands of one man, Senator.

Senator SYMINGTON. What is the difference between "direction" and "control"? Is the administration of the program in the hands of one man?

Mr. QUARLES. I can only say, sir, you changed the word, and I assume you had a reason for doing so, and I prefer to stick to the word "direction" because I am sure I know what that means.

Senator SYMINGTON. I stand corrected, then. Is the administrative responsibility and authority of the program in the hands of one man who controls the three services?

Mr. QUARLES. The administration of the program is not in the hands of one man; no, sir. I have not testified that it was. I have testified that the direction of the program is in the hands of one man.

Senator SYMINGTON. I am trying to follow you, to the best of my ability.

How can you direct a program if you have not the right to administer it?

Mr. QUARLES. I do not say you do not have the right to administer it, because the Secretary of Defense has the legal right, I think, to take any action that he deems appropriate, of course, within congressional appropriations and other laws. I am merely bringing out that in the area of guided missiles, the Director of Guided Missiles is given that kind of authority by the Secretary of Defense.

Senator SYMINGTON. Coming back to a previous point, the staff points out that in the national security items of expenditures, military construction, Reserve components, research and development, and other, is a figure given of \$5,039 million. This is in the pamphlet entitled "1958 Federal Budget Midyear Review," put out by the, Bureau of the Budget and the Executive Office, of the President October 1957.

Mr. QUARLES. That, however, Senator Symington, is not the \$5 billion that we are talking about.

Senator SYMINGTON. Would you know where there is any other research and development figure which totals up to \$5 billion except for that figure?

Mr. QUARLES. I do not know where there is one in that pamphlet, sir; but I know where there is such a figure, yes. I will be glad to produce it for you, sir, with a detailed breakdown.

(The Department of Defense subsequently furnished the following:)

EXPLANATION OF \$5,039 MILLION SHOWN ON PAGE 45 OF THE 1958 FEDERAL BUDGET MIDYEAR REVIEW FOR MILITARY CONSTRUCTION, RESERVE COMPONENTS, RESEARCH AND DEVELOPMENT, AND OTHER

The budget document each year shows Department of Defense expenditures for military functions in terms of eight major budget categories. These are: (1) Military personnel, (2) operation and maintenance, (3) major procurement and production, (4) military construction, (5) Reserve components, (6) research and development, (7) establishmentwide activities, and (8) working capital (revolving) funds. In the 1958 Federal Budget Midyear Review published by the Bureau of the Budget in October 1957, the last five budget categories were lumped together, apparently in order to shorten the table in question. This was simply a matter of presentation and was not meant to imply that these five budget categories constituted a single program.

The \$38,377 million shown in the 1958 Federal Budget Midyear Review for Department of Defense expenditures for fiscal year 1957 was based on preliminary year-end reports. Final reports for fiscal year 1957 show that expenditures for Department of Defense military functions totaled \$38,439 million, distributed by category as follows:

<i>Category</i>	<i>Million</i>
Military personnel costs.....	\$10, 384
Operation and maintenance.....	9, 214
Major procurement and production.....	13, 649
Military public works.....	1, 906
Reserve components.....	1, 054
Research and development.....	1, 686
DOD establishmentwide activities.....	849
Working capital (revolving) funds.....	- 414
Undistributed (M accounts).....	111
Total.....	38, 439

ACTIVITIES SUPPORTING THE RESEARCH, DEVELOPMENT, TEST, AND EVALUATION PROGRAM IN THE DEPARTMENT OF DEFENSE

In connection with the discussion of the fiscal year 1957 budget, a statement was placed in the records, and its purpose was defined in the introductory paragraph as follows:

"The introduction of improved weapons and military equipment into the combat and combat-support forces of the Army, Navy, and Air Force is a complicated process covering many different, although related, activities which must be completed before a new weapon or item of military equipment can be considered as fully developed in a military sense. From a military standpoint, a new item cannot be considered as fully developed until it is capable of performing an assigned combat mission, and has been assigned for operational use by the combat or combat-support forces. The lines between 'research,' 'development,' and 'pro-

curement' cannot be drawn precisely, particularly in areas of rapidly advancing technology. For purposes of budgetary presentation a narrowly construed definition has been used for 'research and development,' which does not give the full measure of our research, development, test, and evaluation effort."

In order to modernize the military forces, it is necessary for the Department of Defense to conduct complete programs which include many different phases, starting with research and ending with the final equipping of the combat or combat-support units. These phases do not lend themselves to clear-cut identification in terms of either of time sequence or budgetary support. However, the kinds of steps necessary to provide an actual increase in military effectiveness through research, development, test, and evaluation are indicated by the following:

(1) Invention and preliminary design of definite concepts for applying scientific and technological possibilities to military requirements.

(2) Practical demonstration of new principles and components.

(3) Engineering and design of specific new items, components, and materials, for test and evaluation.

(4) Fabrication and production of new items, components, and materials, for test and evaluation.

(5) Conduct of tests for technical evaluation of new items.

(6) Conduct of tests for evaluating the producibility of new items, components, and materials.

(7) Conduct of operational suitability tests for military evaluation of new items and weapons systems.

(8) Conduct of tests and maneuvers to establish military tactics and doctrine for the combat use of the new items.

(9) Planning of supporting requirements (facilities, personnel, training, maintenance, etc.) for operational use of new items.

(10) Production engineering for quantity procurement of new items.

(11) Initial production of new items for use by the first combat units.

(12) Training and deployment of the first combat units and establishment of the necessary support (facilities, supply system, etc.).

(13) Reorganizing and retraining all combat units required to phase in new weapons and phase out obsolete weapons.

The Department of Defense has recognized the fact that the effort supported by the "Research and development" appropriations does not give a full measure of the effort devoted to the research, development, test, and evaluation programs, because support such as the procurement of items for engineering and service test are usually financed in other appropriations. The Department of Defense has also recognized the fact that the full cost of modernizing the military forces cannot be considered as research and development. In preparing this statement covering the research, development, test, and evaluation program of the Department of Defense, it was necessary to draw a line between the two extremes.

Based on data submitted by the military departments, the funds programed for research, development, test and evaluation in fiscal years 1955, 1956, 1957, and 1958 are estimated as follows:

1. Department of Defense total

[In millions of dollars]

	Fiscal year—			
	1955	1956	1957	1958 ¹
Research and development.....	1,221.1	1,493.5	1,747.0	1,701.1
Activities supporting research and development.....	344.3	445.5	639.4	549.7
Development, test, and evaluation items.....	1,826.4	1,830.1	2,804.5	3,067.8
Total.....	3,391.8	3,769.1	5,190.9	5,318.5
Army.....	612.5	718.2	1,052.4	1,378.4
Navy.....	683.7	906.5	1,355.4	1,579.9
Air Force.....	2,095.6	2,144.4	2,648.1	2,225.2
Interservice (emergency fund).....			135.0	135.0

¹ Preliminary estimates.

The above estimates are derived as follows:

2. Departmental summary

[In millions of dollars]

	Fiscal year—			
	1955	1956	1957	1958 ¹
(a) Army:				
Research and development.....	366.3	421.3	410.0	400.0
Activities supporting research and development.....	37.8	48.7	89.4	91.8
Development, test, and evaluation items.....	208.4	248.2	553.0	886.6
Total.....	612.5	718.2	1,052.4	1,378.4
(b) Navy:				
Research and development.....	434.4	474.2	492.0	505.0
Activities supporting research and development.....	51.2	106.4	130.0	110.5
Development, test, and evaluation items.....	198.1	325.9	733.4	964.4
Subtotal.....	883.7	906.5	1,355.4	1,579.9
(c) Air Force:				
Research and development.....	420.4	598.0	710.0	661.0
Activities supporting research and development.....	255.3	290.4	420.0	347.4
Development, test, and evaluation items.....	1,419.9	1,256.0	1,518.1	1,216.8
Subtotal.....	2,095.6	2,144.4	2,648.1	2,225.2
(d) Interservice (emergency fund).....			135.0	135.0

3. New obligational authority—Research and development appropriations

[Millions of dollars]

	Fiscal year—			
	1955	1956	1957	1958 ¹
Army.....	366.3	421.3	410.0	400.0
Navy.....	434.4	474.2	492.0	505.0
Air Force.....	420.4	598.0	710.0	661.0
Emergency fund.....	(²)	(²)	³ 135.0	³ 135.0
Total.....	1,221.1	1,493.5	1,747.0	1,701.0

¹ Preliminary estimates.

² Transfers included in Army, Navy and Air Force new obligational authority amounts.

³ Includes \$50,000,000 transfer authority.

4. SUPPORTING ACTIVITIES DIRECTLY RELATED TO RESEARCH AND DEVELOPMENT

Certain of the requirements in direct support of the research and development program are not included in the "Research and development" appropriations, but are included in other appropriations which provide the same general type of support for all military programs. These include military construction, industrial facilities financed under procurement appropriations, and the pay and allowances of military personnel. On the basis of detailed program data, the amounts

in these appropriations that are directly related to the activities financed under the "Research and development" appropriations are estimated as follows:

[In millions of dollars]

	Fiscal year—			
	1955	1956	1957	1958 ¹
(a) Military construction:				
Army.....	1.9	8.0	43.1	23.1
Navy.....	9.7	63.0	52.5	51.6
Air Force.....	109.3	98.5	208.6	174.1
Subtotal.....	120.9	169.5	304.2	248.8
(b) Industrial facilities:				
Army.....				12.1
Navy.....			34.5	16.5
Air Force.....	45.2	88.1	98.1	64.1
Subtotal.....	45.2	88.1	132.6	92.7
(c) Military personnel:				
Army.....	35.9	40.7	46.3	56.6
Navy.....	41.5	43.4	43.0	42.4
Air Force.....	100.8	103.8	113.3	109.2
Subtotal.....	178.2	187.9	202.6	208.2
(d) Department of Defense, total:				
Military construction.....	120.9	169.5	304.2	248.8
Industrial facilities.....	45.2	88.1	132.6	92.7
Military personnel.....	178.2	187.9	202.6	208.2
Total.....	344.3	445.5	639.4	549.7
Army.....	37.8	48.7	89.4	91.8
Navy.....	51.2	106.4	130.0	110.5
Air Force.....	255.3	290.4	420.0	347.4

¹ Preliminary estimate.

5. ITEMS UNDER DEVELOPMENT, TEST, AND EVALUATION

Many of the programs for developing new weapons and military equipment have, as the result of previous years' research efforts, reached a stage where it is necessary to procure preliminary production items in limited quantities for test and evaluation as to—

(a) The soundness of the engineering design.

(b) The feasibility of the production design.

(c) The operational suitability of weapons or equipment from a military standpoint, prior to standardization for operational use and large scale production for issue or inventory.

Major engineering changes and improvements must be made in new developments, provisionally accepted for limited production and use, to satisfy the need for achieving early operational capabilities with the most modern weapons attainable in support of national security policy. All procurement items which have been standardized or otherwise approved for service use within the military departments have been excluded from the following estimates. Procurement items

which are not standardized, to the extent they can be identified at this time, are considered as being under development, and are estimated as follows:

	Fiscal year—			
	1955	1956	1957	1958 ¹
(a) Aircraft:				
Army.....				27.5
Navy.....	60.4	10.9	445.6	589.7
Air Force.....	755.3	152.4	96.3	133.0
Subtotal.....	815.7	163.3	541.9	750.2
(b) Guided missiles:				
Army.....	168.7	83.0	453.0	689.6
Navy.....	70.0	104.3	142.6	130.8
Air Force.....	418.4	810.9	1,076.1	631.1
Subtotal.....	657.1	998.2	1,671.7	1,451.5
(c) Ships:				
Army.....				
Navy.....	41.7	177.6	62.4	169.1
Air Force.....				
Subtotal.....	41.7	177.6	62.4	169.1
(d) Other:				
Army.....	39.7	165.2	100.0	169.5
Navy.....	26.0	33.1	82.8	74.8
Air Force.....	246.2	292.7	345.7	452.7
Subtotal.....	311.9	491.0	528.5	697.0
(e) Department of Defense total:				
Aircraft.....	815.7	163.3	541.9	750.2
Guided missiles.....	657.1	998.2	1,671.7	1,451.5
Ships.....	41.7	177.6	62.4	169.1
Other.....	311.9	491.0	528.5	697.0
Total.....	1,826.4	1,830.1	2,804.5	3,067.8
Army.....	208.4	248.2	553.0	886.6
Navy.....	198.1	325.9	733.4	964.4
Air Force.....	1,419.9	1,256.0	1,518.1	1,216.8

¹ Preliminary estimates.

6. ITEMS NOT ESTIMATED

In addition to the above program items which could be identified from data presently available, there are other activities of the Department of Defense and the three military departments which provide significant support to the research and development programs, but which have not been included because the amounts applicable to the research and development program cannot be readily identified. These items include, but are not limited to, the following:

- Departmental administrative costs.
- The regular operating and maintenance cost of military ships, aircraft, and troop units used in conducting tests.
- The pay and allowances of military personnel attached to regular military units used in conducting tests other than specific operational evaluation organizations.
- Costs which are part of production contracts required for the further development of standardized items which must be adapted to other uses or improved in performance.
- The regular military costs, associated with operational and training units, required in the process of phasing out obsolete weapons and phasing in improved weapons, such as the changeover from propeller-driven aircraft to turbojet aircraft.

Senator SYMINGTON. So this figure is not the \$5 billion figure to which you refer; but it is the only figure given here for research and development.

Mr. QUARLES. Well, I am sorry I am not familiar with the exact pamphlet you have. The number is not exact if it referred to the \$5.2 billion that I spoke of in the first place.

In the second place, if it is defined in the words you read, it would not define the \$5.2 billion that I am talking about.

Senator SYMINGTON. This is part 4, Mr. Secretary, Detailed Statements Comparing Revised 1958 Budget With Previous Years. This is the only figure on research and development given in the budget.

Do you know—let's see, sputnik was October 4. We are pretty close to 8 weeks now; is that right?

Mr. QUARLES. Sputnik No. 1 was October 4; yes, sir.

THE LIMITED AREA OF ACCELERATION

Senator SYMINGTON. Yes. I meant No. 1.

Do you know of any acceleration of any procurement programs for the Army and the Navy and the Air Force, outside the missile picture, since October 4?

Mr. QUARLES. Outside of the missile picture and as of this time I do not know of any.

I also cannot say that I know there were none.

Senator SYMINGTON. You are the Deputy Secretary of Defense, are you not?

Mr. QUARLES. Yes, sir; I am.

Senator SYMINGTON. Do you know of any lifting of any overtime restrictions in any field except the missile field in the some 7½ weeks since Sputnik I?

Mr. QUARLES. There has been an overtime relief in the satellite program, as I remember it, which you may include in the missile field in your definition, and if so, the rest of the program across the board is subject to the directive that the Senator referred to earlier this afternoon, and I am not aware either of any request for relief or of any relief.

The directive, however, did, in the first place, permit overtime under certain stated conditions and did permit requests or reclama for additional overtime in case the departments felt this was desirable and we have not to the best of my knowledge received any.

Senator SYMINGTON. Well, do you know of any change from the 5-day week tempo in the production of Army, Navy, and Air Force materials outside of the missile, or/and satellite program?

Mr. QUARLES. I know of no change from the production tempo, Senator Symington.

I think to speak of it as a 5-day week tempo perhaps is not quite accurate across the board but at any rate I know of no changes since that time.

Senator SYMINGTON. Well, Mr. Secretary, a good many manufacturers have recently asked me "Why is it we don't get going? We are on a 5-day week program. We close up our plants Friday afternoon and then we have the problem, as any manufacturer knows, of getting them started again Monday morning."

You know if you have a restriction on overtime and you are on a 5-day week tempo why, after this tremendous shot in the arm we have gotten from what Dr. Teller called the technological Pearl Harbor of Sputnik I—we have to fight a war with existing forces, not with developments or blueprints of missiles.

Why is it we have not accelerated any of our Army, Navy, and Air Force existing forces? To the best of my knowledge, we have not replaced a single cut we made in the year 1957—the result of the fixed expenditure ceiling, the rigid ceiling placed on the Department of Defense this year, 1957.

Now, if this is a serious matter, and I was very much impressed with the counsel trying to find out whether you did or did not think it was a serious matter today as against some of your statements in the past, if we do have to defend ourselves with existing forces, then why don't we at least replace the cuts, slowdowns, and cutbacks that we made in the year 1957, and get off of this 5-day-week tempo?

Mr. QUARLES. I will answer that. I am glad to answer it. I am sure, with your great experience, sir, you well appreciate the fact there is no connection between a 5-day week and an order that limits overtime. You can have 2 shifts, 3 shifts, or any other number of shifts and work every hour of every week and still have no overtime, and I am sure the Senator knows that.

Senator SYMINGTON. Well, I don't know it, because you cannot work 3 shifts efficiently because you don't have any time for maintenance and overhaul, but you can work 2 shifts. On that I agree with you 100 percent.

Do you know of any order of any kind that has gone out to any manufacturer, or any supplier of the Army, Navy, or Air Force, which allows him to go to a two-shift basis since sputnik I was fired that he was not on already before sputnik I was fired?

Mr. QUARLES. I don't have detailed information, sir, but I am sure there are many places in industry serving the Military Establishment at the present time where there is more than 1 shift and more than a 40-hour, 5-day week.

HE CANNOT CITE CASE WHERE TWO SHIFTS ARE USED

Senator SYMINGTON. I am going to ask the chairman to get manufacturers to come before this committee who have asked why it is we don't get off the 5-day-week tempo. I agree we could work two shifts. I was wondering if you knew of any case since Sputnik I where we have specified to a manufacturer that he go to two shifts.

Mr. QUARLES. I cannot cite any such case.

Senator SYMINGTON. I have asked that question before, and don't know of any. I have asked that question; thank you Mr. Chairman.

Mr. WEISL. Secretary McElroy called, and he wanted to know whether you wanted to question him.

Senator SYMINGTON. Mr. Chairman, I am a little woozy. It is very late in the evening. Could I ask questions at some other time? I certainly would not want him to come down this late tonight and have all these other people wait. Some of the questions I planned to ask the Secretary I have asked the Deputy Secretary.

Senator JOHNSON. We asked the Secretary to stand by, and we are willing and anxious for him to complete his testimony.

He will be before us again, particularly, in executive session. It may be that you will want him again in open session, and we will be glad to call him if you feel it should be. If you will submit to the Chair by next Monday the list of manufacturers that you would like to have subpoenaed, the Chair will direct the counsel to prepare subpoenas and we will bring them in, pursuant to your suggestion.

Inform the Secretary that Senator Symington does not desire to continue with his interrogation this evening; that the other Senators have finished with him; and we expect to hear him in executive session after the 13th.

Senator CASE. He said he was willing to come.

Senator SYMINGTON. That is very kind of him, and I appreciate it.

Mr. Chairman, if we are going to have a declassification of classified testimony that would automatically come out if we could question him in executive session, could we not?

Senator JOHNSON. Sure. Anything that was not classified.

Senator SYMINGTON. That is right.

Senator JOHNSON. I wanted to be sure you continued your questioning of him in the same kind of session you started if, if you so desire.

Senator SYMINGTON. I appreciate your courtesy.

Senator JOHNSON. Have you finished with the witness?

Senator SYMINGTON. I have, Mr. Chairman.

Senator JOHNSON. Senator Stennis, do you have any questions?

Senator STENNIS. No further questions.

Senator JOHNSON. Mr. Kefauver, do you have any questions?

Senator KEFAUVER. No, sir.

Senator JOHNSON. Mr. Secretary, were you present during the appearance of the Secretary of Defense?

Mr. QUARLES. This afternoon I was, sir.

Senator JOHNSON. You heard his statement announcing the decision today regarding Jupiter and Thor?

Mr. QUARLES. Yes, sir.

Senator JOHNSON. You heard his response to my question as to what he felt could and should be done now to insure the maximum defense of this Nation?

Mr. QUARLES. I did, sir. In relation to the five points, do you not mean? Yes, sir.

Senator JOHNSON. You heard his general statement that, without dotting every i and crossing every t, he was in general agreement with the suggestions made to this committee by Dr. Teller?

Mr. QUARLES. Dr. Teller; yes, sir; I do.

Senator JOHNSON. Are you in agreement with the Secretary on all those points?

Mr. QUARLES. I am, sir.

IN ACCORD WITH DR. TELLER'S SUGGESTIONS

Senator JOHNSON. Do you have any suggestions that you feel you could make to this committee out of your wealth of experience that you think would contribute to increasing our defense posture and to securing this Nation?

Mr. QUARLES. Mr. Chairman, thank you. I have suggestions. I find that Dr. Teller actually summarized them very much as I would.

As the Secretary of Defense mentioned this afternoon the matter of the shelter part of his recommendations gets a bit out of our field but with that single exception as far as I know, I would say that I heartily endorse Dr. Teller's views as to the important things to do, and I do not now remember whether he included the Cordiner personnel actions, and if he did not, I should like to add that to his list as representative of the general area and very important area of improving the welfare of our, particularly of our skilled servicemen, and the attractiveness of the service, too.

Generally speaking, these would be my recommendations.

Senator STENNIS. Mr. Chairman, may I say a word on that?

Senator JOHNSON. Senator Stennis.

Senator STENNIS. Had you finished on the Cordiner—

Mr. QUARLES. Thank you, Senator.

Senator STENNIS. Yes.

Mr. Chairman, I had understood the Cordiner matter was not to be brought into these hearings. I do not particularly object to it, but there have been so many piecemeal things said about it prior to a real chance to have hearings on it, that I feel compelled, especially in view of Secretary Quarles' few remarks there, to at least say a few words about it.

I think it has a great deal of merit, the Cordiner report does, and there are some phases of it that I am certainly in favor of, but I have never known one single proposal to have as much said about it with as few supporting facts as there is about the Cordiner report.

I have read in many papers and resolutions and heard it on the floor of the Senate, that it will save \$5 billion, but when Mr. Cordiner came before our committee, subcommittee, and I gave him a chance to support that statement, he said that was not his estimate.

He made no effort to support it. He did not exactly disown it, but said it was not his, but it was the Department of Defense's.

Now, sometime about July, I sent a questionnaire over to the Department of Defense. I think there were 40 or 50 or maybe 60 questions, and as yet we have not been favored with one scratch of a reply.

And I wrote you a letter again today, saying that I thought the whole manpower problem was involved in the Cordiner report, the Cordiner hearing, and as for my part, I did not feel inclined to proceed until the Department of Defense at least tried to answer those questions or refused to answer them.

Now, in view of that—the Secretary comes here, comes here and supports the Cordiner report—it is another instance of a matter being asserted, but no proof being offered.

There is another thing about the Cordiner report, and I do not say this critically of Mr. Cordiner. I think he has done a fine job, but the primary purpose, as stated, was to increase the pay particularly of certain groups, to induce them to stay in the service.

Still, a major recommendation was that this increase would apply to men who had already retired from the service.

In view of such a glaring inconsistency, they may decide all their recommendations had better be pretty thoroughly examined.

So I repeat, we have heard it here spoken about, but never proven, and those who have been called upon to put up some proof do not reply. So I am just going to make those letters I have in mind, make

those letters public, and we will try to get the issue on the merits, and then try to decide it on the merits.

I thank you, Mr. Chairman.

Senator JOHNSON. Thank you, Senator Stennis.

Is there any other question? Senator Barrett, do you have any questions?

Mr. QUARLES. Senator Stennis, if I might, I feel I really owe Senator Stennis and his committee a bit of an apology.

I used the word "Cordiner" as a shorthand expression for a plan for improving the pay structure in an effort to increase the attractiveness of the service to the highly skilled people.

Senator STENNIS. If I may say it, Mr. Chairman, let us make clear, no one owes me an apology. This is a public matter.

But I am calling now on those who assert those things to come in and prove them, and let us put something on the line that we make some recommendations on. And we will have hearings at the convenience of the Department of Defense or anyone else who is interested, and I hope the witnesses, at least some of them, will be impartial witnesses, people who are not going to benefit personally by the legislation, one way or the other.

Mr. QUARLES. That is correct, sir.

Senator STENNIS. All right.

Senator JOHNSON. Do you have any further response?

Mr. QUARLES. Thank you, sir.

Senator JOHNSON. Senator Barrett?

Senator BARRETT. I have no questions.

I want to say I believe Secretary Quarles made a very admirable presentation of the case this evening, and it has been a long time, and I do not want to belabor the matter by further questioning at this hour.

Mr. QUARLES. Thank you, sir.

Senator JOHNSON. Thank you, Senator Barrett.

Senator Symington?

Senator SYMINGTON. One further question, Mr. Chairman.

Mr. Secretary, I have always respected your integrity and your desire to do the best job possible for our country. I think it would be a grave mistake for our national security that, because of all the hullabaloo over our missiles programs resulting from sputnik, we chased the Russians in that field, and, forgot about what we have to fight with, in case we have to defend one of our allies or are attacked ourselves.

Now, with that premise, would you be good enough to furnish the committee any directive or order that has been issued to accelerate or increase, accelerate any procurement or increase any funds for maintenance and operation or research and development, in the Army or the Navy or the Air Force, since the 4th of October? Would you furnish those to the committee?

Mr. QUARLES. I would be glad to furnish them.

Senator SYMINGTON. I say, in all sincerity, to the best of my knowledge, there are not any.

Mr. QUARLES. I am not able to cite any one, but, if there are any, I will certainly cite them, and, in any case, I will furnish an answer for the record.

(Subsequently, the Department of Defense furnished the following:)

SOME RECENT ACTIONS TAKEN TO EXPEDITE IMPORTANT PROGRAMS

1. Removal of overtime limitations on top-priority programs.
2. Restoration of basic-research programs to former level.
3. Army authorized to proceed with launching a satellite by use of Jupiter-C test vehicle. Both Vanguard and Jupiter satellite programs assigned top priority.
4. Authorized production and operational deployment of both Thor and Jupiter missile systems.
5. Acceleration of the Atlas program.
6. Acceleration of fleet ballistic missile weapons system (Polaris) in fiscal year 1958 supplemental appropriation.
7. Army authorized to proceed immediately with the development of a solid-propellant missile as a replacement for the Redstone.
8. Establishment of the Office of the Director of Guided Missiles.
9. Establishment of the Advanced Research Projects Agency.
10. Increased antisubmarine capability in fiscal year 1959 budget; also, acceleration of research and development on antisubmarine warfare.
11. SAC alert, dispersal, and relocation of tankers to northern bases.
12. Air Force authorized to proceed with program to install an early-warning system for detection of ICBM.
13. Defined Army and Air Force responsibilities and reemphasized the urgency for the development of defense against the ICBM. Top priority confirmed for anti-ICBM and military satellite projects.
14. Appointment of full-time special assistant and group of consultants to advise the Secretary as to the organization of the Defense Department.

Senator SYMINGTON. Thank you very much, Mr. Secretary, for your intelligence and your endurance.

Mr. QUARLES. Thank you, sir.

Senator JOHNSON. Any questions, Senator Kefauver?

Senator KEFAUVER. No questions, Mr. Chairman.

Senator JOHNSON. Further questions, Senator Stennis? Any further questions?

Senator STENNIS. No, thank you.

Senator JOHNSON. Any questions, Senator Case?

Senator CASE. No questions, Mr. Chairman.

Senator JOHNSON. Senator Barrett?

Senator BARRETT. No.

Senator JOHNSON. Mr. Secretary, this committee has listened very carefully—

Mr. QUARLES. Patiently.

ANOTHER PEARL HARBOR

Senator JOHNSON (continuing). And very attentively to your testimony, I think, for more than 3 hours. We have had a very long and difficult session, and I compliment you on your poise and your patience and your clarity of expression, and your ability to express yourself forcibly.

There is one comment I would like to make. I have heard your contention that we are in reasonably good shape because of our surface ships, SAC, atomic devices. The thought just occurred to me that what we are actually saying is, we are ahead in the weapons of the past, perhaps behind in the weapons of the future.

Now, this committee is going to reassemble here December 13. It is made up of seven members of the subcommittee, and each member of the Armed Services Committee is an ex officio member of this group.

I believe, as much as I believe anything in my life, that you will find there is no group of more dedicated men, no group of men anywhere that are more devoted to the interests of their country.

We found out the morning after Pearl Harbor that we had no internationalists and no isolationists. We were all Americans. We had no Democrats and no Republicans.

We meet today in the atmosphere of another Pearl Harbor, so to speak. I hope that you and your subordinates, between now and December 13, when we meet again, will give careful thought to the problems that confront us, the Congress, and will be prepared to bring forth any suggestions that you think we could act on which would be helpful to strengthen the defense of this Nation, and will give us any criticisms that you may have as to our approach to this whole problem.

We want to be fair; we want to be just. This is one Nation, indivisible. We are all good Americans, trying to do the best we can as we see it, and we are much more interested in where we are going than where we have been.

Thank you, Mr. Secretary.

The committee will take a recess until December 13.

Mr. Holaday, I want to express my great appreciation to you for your endurance, for your standing by. It is with deep regret that we are unable to hear your testimony, but you have many days to prepare it in the light of what you have observed today, and perhaps will be a better equipped witness when we come back. We look forward with great interest to hearing you.

Secretary Quarles, do you have anything to say?

Mr. QUARLES. Mr. Chairman, I wanted to make an unprecedented request of the chairman. You spoke of our being ahead in weapons of the past, and being behind in weapons of the future, and I know the whole world will be listening to your words, and I wanted to ask you if you would be willing to amend them and substitute the word "present" for "past."

Senator JOHNSON. Well, I am glad to hear your suggestion.

The committee stands adjourned.

(Whereupon, at 11:45 p. m., the subcommittee adjourned, to reconvene at 10 a. m., Friday, December 13, 1957.)

INQUIRY INTO SATELLITE AND MISSILE PROGRAMS

FRIDAY, DECEMBER 13, 1957

UNITED STATES SENATE,
PREPAREDNESS INVESTIGATING SUBCOMMITTEE,
OF THE COMMITTEE ON ARMED SERVICES,
Washington, D. C.

The subcommittee met, pursuant to recess, at 10:10 a. m., in room 318, Senate Office Building, Senator Lyndon B. Johnson (chairman of the subcommittee) presiding.

Present: Senators Johnson (Texas), Kefauver, Stennis, Symington, Saltonstall, and Flanders.

Also present: Senator Bush, member of the Committee on Armed Services, and Senator Carroll; Edwin L. Weisl, chief counsel; Cyrus R. Vance, counsel; Gerald Siegel, associate counsel; Solis Horwitz, associate counsel; Daniel F. McGillicuddy, associate counsel; Stuart P. French, associate counsel; Edwin L. Weisl, junior counsel; Dr. William V. Houston, consultant; and Dr. Edward C. Welsh, staff adviser.

Senator JOHNSON. The committee will be in order.

We are opening the second round of our hearings on the satellite and missile programs. We are going to hear the services, the groups that have actual responsibility for developing the weapons of survival.

Our first set of hearings were intended to offer us some perspective on the problems that we face. I believe you will agree that they succeeded.

It is apparent that research and development is a key problem. America's production capacity is not the question. Our production facilities supply us with the highest standard of living in the history of the world. And yet, as we meet here today, a large part of our productive capacity is idle.

Our workers are the most efficient and the most productive the world has ever known, but more than 3 million of them are today looking for jobs.

Our industrial leaders are imaginative, courageous, and able, but they are complaining already about the need for more orders to keep their factories going.

The key to the situation, as I see it, is the group of dedicated scientists and engineers who are struggling to develop the weapons of the immediate future. From the studies made by our staff, I am deeply impressed by the devotion and competence of our scientists and our engineers.

I do not believe in trying to change a statement that expresses a thought perfectly. Therefore, in referring to these scientists and engineers, I am going to paraphrase a statement that was once made by Winston Churchill.

Never in the history of human endeavor have so many depended upon so few.

We have an obligation to those men—an obligation which can be paid only by helping them to the fullest extent of our capabilities.

If these scientists and engineers need more facilities, they should have them.

If they need more resources, they should have them.

If they need better organization, it should be supplied.

If they need more dollars, they should be appropriated, and I believe they will.

And this committee meets here today to help in every way that it can.

Once the technicians have completed their job, America can swing into the production problem rapidly. The unused productive capabilities could be put into use; the unused workers could be put back to work.

The weapons themselves will come rapidly, once the development work is done.

A PLEA FOR IDEAS TO SPEED DEVELOPMENT

The committee is looking for steps that will speed the development stage. We are hoping that the witnesses in the next few days will present ideas of how they think we can best get over the hump.

We have a logjam to be broken, and the quicker it is broken, the better for all of us.

The vital necessity of speed was emphasized once again this morning. The newspapers tell us that, once again, the Soviet Union has presented the world with another poorly concealed threat.

We have entered a period of international blackmail on a scale never before practiced in history. That period will continue until once again the United States is back in the lead on technology.

We are calling as our first witness this morning the man who is in charge of the missile program for the Defense Department.

Dr. Livingston, of Harvard University, had been scheduled to appear, but he is suffering from a temporary illness and he will not testify until next week.

The first witness is William M. Holaday, the Director of Guided Missiles, of the Defense Department.

Mr. Holaday, this committee is fully aware of the tremendous responsibilities that have been laid upon your shoulders. In effect, you are the man on the spot, the man to whom the American people and the free world look for missiles.

We are interested in whether you have been granted authority equal to these grave responsibilities. We are concerned with whether you have the facilities that truly make you a director in charge of missiles, or whether you just have the title.

In order to save time, I am inserting your biography in the record. (Mr. Holaday's biographical statement follows:)

WILLIAM M. HOLADAY, DIRECTOR OF GUIDED MISSILES

Mr. Holaday, now 56 years of age, was born in New Vienna, Ohio, in 1901. He was graduated with a bachelor of mechanical engineering degree from Ohio State University in 1925, and spent the next 2 years as a development engineer with the Westinghouse Air Brake Co.

In 1927 he joined the laboratory staff of the Standard Oil Company of Indiana as an automotive engineer.

In 1937 he was named assistant manager of the general laboratories of the then Socony-Vacuum Oil Co. and became director of research in 1944.

During the war years of 1943 and 1944, Mr. Holaday was on leave of absence from the company to serve with the Petroleum Administration for War. Since 1944 he has served as a member of the Military Petroleum Advisory Board and, in a consultant capacity, for the Army, Navy, and Air Force.

Mr. Holaday is a member of the Subcommittee on Aircraft Fuels of the National Advisory Committee for Aeronautics, and has served as Chairman of that Committee's Fuels Subcommittee. For a period of time he served as a member of the Power Plants Committee of the NACA.

Mr. Holaday retired in February 1957, from the Socony-Mobil Oil Co. where he had been director of research from 1944 to 1955. He had been associated on a part-time basis with the fuels and lubricants group of the Department of Defense Research and Development Board and its successor, the Office of the Assistant Secretary (Research and Development) since February 1949. He has been Deputy Assistant Secretary of Defense (Research and Engineering) since the combination in February 1957, of the Offices of the Assistant Secretaries (Research and Development) and (Engineering). He has recently been appointed as Special Assistant for Guided Missiles in the Department of Defense.

A member of the Society of Automotive Engineers, Mr. Holaday served as its vice president in 1942. He also is a member of the Institute of Chemical Engineers, the Petroleum Institute, the Society for Testing Materials, and the Industrial Research Institute.

Senator JOHNSON. I will administer the oath, and then ask counsel to start with the first witness.

Mr. WEISL. May I suggest, Mr. Chairman, that you administer the oath to General Betts, Mr. Waggoner, and Mr. Holaday at the same time, because as I understand it, Mr. Holaday wants to call for assistance from those two gentlemen.

Senator JOHNSON. Will you stand and raise your right hand?

Do you solemnly swear that the testimony you give this committee will be the whole truth and nothing but the truth?

Mr. HOLADAY. I do.

Senator JOHNSON. Do you solemnly swear the testimony you give this committee will be the whole truth and nothing but the truth?

Mr. WAGGONER. I do.

Senator JOHNSON. Do you solemnly swear the testimony you give this committee will be the whole truth and nothing but the truth?

General BETTS. I do.

TESTIMONY OF WILLIAM M. HOLADAY, DIRECTOR OF GUIDED MISSILES, DEPARTMENT OF DEFENSE; BRIG. GEN. AUSTIN W. BETTS, MILITARY EXECUTIVE ASSISTANT TO DIRECTOR OF GUIDED MISSILES; ALVIN G. WAGGONER, CIVILIAN EXECUTIVE ASSISTANT TO DIRECTOR OF GUIDED MISSILES

Senator JOHNSON. Thank you. Sit down.

Mr. Weisl, will you proceed?

Mr. WEISL. Mr. Holaday, your title—

Senator JOHNSON. Mr. Weisl, just a moment, please.

Senator Saltonstall wants a brief description of the duties of the two assistants who will aid you, Mr. Holaday, in your testimony.

Mr. WEISL. Mr. Waggoner, will you please give your duties and your position and your responsibilities?

Mr. WAGGONER. I am Alvin G. Waggoner. I am Executive Assistant to the Director of Guided Missiles.

As a part of my responsibility, I am also Executive Secretary of the OSD Ballistic Missiles Committee.

I assist Mr. Holaday on all specific tasks which he assigns to me.

Mr. WEISL. General Betts?

General BETTS. My duties as Military Executive Assistant are to bring to Mr. Holaday's activities the advice and guidance of my military background, and act for him as his deputy when he is actually absent from the Pentagon.

Mr. WEISL. What is the function, General Betts, of the OSD Ballistic Missiles Committee? Please tell us what the OSD stands for.

General BETTS. The Ballistic Missiles Committee of the Office of the Secretary of Defense is the committee which we are discussing.

The nature of this committee is a grouping of the Assistant Secretaries of Defense who have responsibilities which have a direct effect on the guided-missile program.

The function of the committee, before Mr. Holaday was designated Director of Guided Missiles, was authoritative to the extent that it, as a committee, with Mr. Holaday as Chairman, produced what one could call the decision-making body within the area of the Secretary of Defense's responsibility.

In other words, while they did not usurp the Secretary of Defense's responsibility, they were the last word in presenting advice to him.

Mr. WEISL. And now the last word is Mr. Holaday?

General BETTS. With the direction having been put on Mr. Holaday's shoulders, the OSD Ballistic Missile Committee now becomes more advisory in nature.

Mr. WEISL. Mr. Holaday, according to the directive under which you were appointed, you are, and I quote, "the Director of Guided Missiles":

The Director of Guided Missiles will direct all activities in the Department of Defense relating to research, development, engineering, production, and procurement of guided missiles.

Is that correct?

Mr. HOLADAY. Yes, sir.

CLARIFICATION OF DIRECTOR'S FUNCTIONS

Mr. WEISL. When Secretary McElroy testified, he stated that your position was not executive but, rather, that of a coordinator; that you did not have the power or the right to direct individuals in the various branches of the military service.

Since then, in my interview with you and Mr. Dechert, counsel for the Department of Defense, it was stated that Mr. McElroy misunderstood the question.

Please clarify your powers and duties so that they are more understood or definable.

Mr. HOLADAY. Well, I will try to, Mr. Counsel.

The actual work on guided missiles is in the services, just as the Thor program is part of the Air Force activities, the Jupiter is part of the Army activities.

Our operation may be explained, using my words, that I act more like a vice president of a corporation, and that the managers are the various services to which we give directions.

Most of my directions are letters to the Secretaries of the various services, directing them to do certain kinds of work, approving a program, disapproving a program, and attempting by this method to direct the activities.

So, in effect, I think what Secretary McElroy was trying to say was that all of this research and development is not directly under my hands, in that all of these people are not part of my staff, but that we have to direct, from an organizational viewpoint, like a vice president would direct his managers of research, production, and sales, and things of that type.

Does that help, sir?

Mr. WEISL. No, sir. [Laughter.]

I understood or the committee, I believe, understood certainly from the reading of the directive issued by the Department of Defense and from the speech by the President of the United States that you are the Director of Guided Missiles, directing all activities in the Department of Defense relating to research, development, engineering, production, and procurement of guided missiles and that you have the same power as the Secretary of Defense.

Perhaps we can break it down in order to make it easier for us, Mr. Holaday.

Mr. HOLADAY. I would appreciate that.

Mr. WEISL. How do your duties compare now to what they were when you were the special assistant to the Secretary of Defense in connection with guided missiles?

Mr. HOLADAY. When I was a special assistant to the Secretary of Defense, the letters going to the various services were signed out by the Secretary of Defense.

At the present time, the letters of instructions approving programs, disapproving programs, modifying programs, are signed out directly by myself.

You understand, however, that once the policy has been established in meetings between the Secretary and myself, the Joint Chiefs of Staff, the Deputy Secretary, once the policy is established and the method and direction in which we wish to go, then I proceed to direct and issue the orders as to how the program is to be carried out.

Mr. WEISL. Now, do you issue orders to the Department of the Air Force?

Mr. HOLADAY. Do I?

Mr. WEISL. Do you; can you?

Mr. HOLADAY. Yes, sir; I do.

Mr. WEISL. Can you tell the Department of the Air Force—and when I say the “Department of the Air Force” I also include the Department of the Navy and the Department of the Army—can you tell them what missiles to put into production?

Mr. HOLADAY. Yes, sir. We review the programs, approve the amount of money going into the effort of research and development, that which goes into procurement, production, and how many missiles will be built.

Mr. WEISL. Can you cancel a program that has been instituted?

Mr. HOLADAY. Yes, sir; I think that that authority rests in my hands.

Mr. WEISL. Have you ever done that?

Mr. HOLADAY. I have not directly issued any to any service to discontinue a program.

While I was Special Assistant to the Secretary of Defense, through advice from my office, two projects were dropped.

Mr. WEISL. Do you direct the research and development departments of each of the services in connection with guided missiles?

Mr. HOLADAY. I do from a management standpoint; I do not specifically go down into the labs and tell each fellow just what to do.

Mr. WEISL. Do you keep in touch with what they are doing?

Mr. HOLADAY. Yes, sir.

Mr. WEISL. And have you the right to stop what they are doing?

Mr. HOLADAY. Yes, sir.

Mr. WEISL. Have you the right to allocate funds in connection with what they are doing?

Mr. HOLADAY. If the funds are in the budget and available for the work, I can approve that expenditure of money.

Mr. WEISL. And if the funds are in the budget, can you increase the amount of money for research and development?

Mr. HOLADAY. No, sir; not without going back and getting more money.

Mr. WEISL. I say if the funds are available.

HAS AUTHORITY TO INCREASE OR DECREASE AVAILABLE FUNDS

Mr. HOLADAY. If the funds are available, which we do quite often by reprogramming or recommending—

Mr. WEISL. I am asking whether you can do that, not "we."

Can you, as Director of Guided Missiles, where funds are available for research and development on a particular missile project, reduce or increase those funds?

Mr. HOLADAY. Yes, sir.

Mr. WEISL. What is your power or duty—

Senator JOHNSON. Counsel, Senator Saltonstall desires to propound a question.

Senator Saltonstall?

Senator SALTONSTALL. Counsel has been using the word "available" and you have been using the word "available."

Does that mean the money that has been apportioned to research by the Budget Director Brundage and by the Comptroller McNeil; is the word "available" used that way or is it used as available in the budget?

I think that ought to be made very clear.

Mr. HOLADAY. Well, sir, to answer your question, in the ballistic-missile field, we have always at the time the budget has been approved, taken the total amount of money and frozen that amount of money to give us flexibility to either increase research if this happened to be the short area, or to devote more to production if this happened to be the short area, so it is the amount of money that has been appropriated for the missile program that we can readjust.

We have no—I have no power to put any more money in there than that which can be put into the missile program.

Senator JOHNSON. I let the bar down a little bit so that Senator Saltonstall could understand what you meant by money available. I would like for counsel to go on and complete his examination.

Senator Bush desires to ask a question. I hope this will not be a precedent.

Senator BUSH. No.

Mr. Chairman, this is purely to clarify the questioning here.

Counsel is using the words "guided missile" and I wanted to be sure we were talking about Mr. Holaday's position as Director, that we are not only talking about guided missiles but about the whole field.

DIRECTIVE INCLUDES AUTHORITY AS TO ALL MISSILES

I wanted to inquire from Mr. Holaday, so we will have the record clear on it that he has charge of the whole field of missile development in the Defense Department, is that so?

Mr. HOLADAY. Yes, sir; this happened when I was made Director, all of the missiles were then put under my direction and we plan and will operate by exactly the same procedures we have used on ballistic missiles on all missile programs.

Mr. WEISL. Senator, the directive says Director of Guided Missiles, and I understood guided missiles includes all missiles.

Senator BUSH. I don't so understand; I wanted the record to be clear on that.

Senator FLANDERS. It is not true that it includes all missiles, so I think Senator Bush, Mr. Chairman, has made an important point.

Senator JOHNSON. Without questioning whether Senator Bush's questioning is important or not, I ask counsel to read into the record paragraph 3 of the directive of the Secretary of Defense creating the job of Director of Guided Missiles.

Mr. WEISL. The Department of Defense directive reads as follows:

Subject.—Director of Guided Missiles.

Purpose.—The purpose of this directive is to provide for the authoritative direction of all activities in the field of guided missiles.

2. *Responsibility and authority.*—In accordance with provisions of subsection 202, the National Security Act of 1947, as amended, and section 5 of Reorganization Plan No. 6 of 1953, there is established the office of Director of Guided Missiles.

The Director of Guided Missiles will direct all activities in the Department of Defense relating to research, development, engineering, production, and procurement of guided missiles.

Now perhaps Mr. Waggoner, you are an expert in that field, and you can clear up the definition of the term "guided missiles" as used here.

Mr. WAGGONER. In most of our papers we have used the words "guided missiles" in a very broad sense, namely, any missile which employs a guidance system which is able to modify the trajectory of the missile after it has been launched.

Now the term "ballistic missiles" has grown up.

In the literal sense it is a guided missile but because of the, shall we say, overriding importance right now of this particular item, we have to consider it somewhat out of context, consider as a point—

Mr. WEISL. Will you pardon the interruption, without going into a lengthy explanation, Mr. Holaday, General Betts and Mr. Holaday understood guided missiles to be all missiles.

Senator BUSH. Is that right?

Mr. WAGGONER. That is true.

Senator BUSH. That is the point I wanted to bring out, Mr. Counsel.

Mr. WEISL. Thank you.

Senator JOHNSON. Proceed, counsel.

I hope you will proceed with your examination.

Each Senator will be given ample opportunity to interrogate on as many subjects as desired.

Mr. WEISL. Mr. Holaday, what is your relation to the Assistant Secretary of Defense for Research and Engineering in connection with missiles?

Mr. HOLADAY. Well, sir, up until the time that I was made Director of all guided missiles, the Assistant Secretary of Defense for Research and Engineering carried a responsibility for a number of missiles such as air-to-air, some of the work in connection with ground-to-air, and some in connection with air-to-ground.

With the establishment of the new office, the primary group doing this work in research and engineering was transferred and became part of my office, in other words, my group in large total, including stenographers and men, from between 18 and 30.

Mr. WEISL. Is your relation to the service heads of research and development the same as that of the relationship that you have just explained?

Mr. HOLADAY. I do not understand your question.

Mr. WEISL. There is in each branch of the service, Navy, Army, and Air Force, a Department of Research and Development for missiles.

Is your relationship to these departments the same as that to the Assistant Secretary in charge of Research and Development for Guided Missiles or for missiles?

Mr. HOLADAY. Well, I would say that the Assistant Secretaries for Research and Development in the various services are part of those services and come under my direction as far as ballistic missiles are concerned. We meet very definitely with these gentlemen when we are reviewing research and development projects.

We meet with other people when we are discussing manufacturing; we talk with other people when we are talking about deployment of missiles.

Mr. WEISL. And that is true of basic research as well as applied research in the missile field?

Mr. HOLADAY. Yes, sir.

TRIPARTITE RESPONSIBILITY IN CONNECTION WITH MISSILES

Mr. WEISL. Now, in connection with missiles there are three problems as I understand them.

One is the development of the missile.

Two, is the development of the base or the launching platform from which the missile must be launched.

Three, the training of crews to operate and launch those missiles.

Do you have duties and responsibilities in connection with all those three stages?

Mr. HOLADAY. Well, sir, my main responsibility, of course, is in the development and production of the missile.

However, in order to have the missile be satisfactory when deployed, I do have an interest but not a direct responsibility on the method of deployment. This is a service characteristic in which I

do not even attempt to be an expert. I do use the best advice that I possibly can, and must use that in order to see that the missile will meet the methods of deployment that the service wishes to use.

Now, the training is of interest to us also in that we are interested in turning over to the service a complete missile system, and a complete missile system has, of course, a training requirement.

We have no direct responsibility over this, but we are very much interested in it to see that the missile, the ground-support equipment, the training and the methods of deployment all come out to give us an excellent or satisfactory missile system.

Mr. WEISL. I am sure you are interested in all those 3 stages, Mr. Holaday, but since a missile, in order to be operative must not only be operational as a missile but must have a base from which it is launched and a crew to operate it; do you have a responsibility to see that all those 3 factors are coordinated and available at the same time?

Mr. HOLADAY. I would say very definitely yes.

I must assume that responsibility.

Mr. WEISL. Yes.

LISTING OF VARIOUS COMMITTEES

There are various committees, scientific and engineering, in the missile field in the Department of Defense.

How many committees are there? Approximately, not exactly.

Mr. HOLADAY. In the Department of Defense—

Mr. WEISL. Mr. Waggoner or General Betts, can you help out?

Mr. HOLADAY. I doubt if we have the total in the Department of Defense. We can give you those that primarily we work with.

Mr. WEISL. Well, there is a Ballistic Committee, is there not, or a Ballistic Missile Committee?

Mr. WAGGONER. Ballistic Missile Committee?

Is that still in existence?

Mr. HOLADAY. Yes, sir.

Mr. WEISL. We cannot hear you.

Mr. HOLADAY. There is an OSD Ballistic Missiles Committee.

Mr. WEISL. What other committees are there?

Mr. HOLADAY. There is the OSD Ballistic Missiles Committee, which is the management committee for the ballistic-missiles program.

There is a scientific advisory committee, which is a group of consultants for the ballistic-missile program.

There is the coordinating Committee on Guided Missiles which was an agency or one of the committees, I should say, of the Office of the Assistant Secretary for Research and Engineering, which confined its activities to those missiles other than the ballistic missiles.

There is a special capabilities panel which confined its activities to the satellite program, to the Vanguard program.

There is the panel on aeronautics which is an advisory panel, which confines its activities to piloted aircraft and guided missiles other than the ballistic missiles.

This to my knowledge is all that there is in the Office of the Secretary of Defense.

Mr. WEISL. And there are other committees of a similar nature within each department of the military, are there not?

Mr. WAGGONER. Within the ballistic-missile program structure there is a Ballistic Missile Committee within each of the departments, in other words there is an Air Force Ballistic Missile Committee, an Army, and a Navy.

However, I think it is fair to point out that in both, in all three cases, the Chairman of these committees happens to be the Secretary of that Service, so that they are management-type committees similar to the Office of the Secretary of Defense Ballistic Missile Committee.

Mr. WEISL. Is there also a Jupiter-Thor Committee?

Mr. HOLADAY. There is an ad hoc Jupiter-Thor Committee which was formed by the Secretary of Defense in August for the purpose of reviewing the two programs to determine whether it would be feasible to provide a single missile which would meet the Air Force's operational requirements out of the Jupiter and Thor programs.

This committee, while it still, shall we say, is on the books, is currently not active.

Mr. WEISL. Do the same people sit on each of these committees or do you have different people on each of these committees?

Mr. WAGGONER. There probably is some cross-membership but in general, I think it is fair to say that the membership is different.

Mr. WEISL. Giving the best educated estimate you can, how many people are involved in all of these committees in the Defense Department and in the various branches of the military forces?

Mr. WAGGONER. There are about 20 in the ballistic missiles committees, that includes the OSD and service committees.

On the advisory committees there are probably somewhere between 25 and 40 civilian consultants.

On the other committees, I would estimate on the order of 15 to 20 people.

Senator JOHNSON. Counsel, I wonder if he could supply for the record the exact number.

Mr. WAGGONER. Yes, sir, we would be glad to do so.

Senator JOHNSON. On each.

Mr. WEISL. Yes. And Senator Kefauver suggests that you give and put in the record the names of each of the members of the various committees.

The Department of Defense furnished the following list of the principal guided missile committees within the Office of the Secretary of Defense, Army, Navy, and Air Force:

Following are the principal guided missile committees within OSD, Army, Navy, and Air Force:

OSD

1. OSD Ballistic Missiles Committee:

Mr. William M. Holaday (Chairman)

Hon. W. J. McNeil

Hon. F. S. Bryant

Hon. E. Perkins McGuire

Hon. P. D. Foote

Dr. R. W. E. Reid, BOB

Mr. A. G. Waggoner (executive secretary)

OSD—continued

2. Scientific Advisory Committee:
 - Dr. Clark B. Millikan (Chairman), California Institute of Technology
 - Dr. Hendrik W. Bode, Bell Telephone Laboratories, Inc.
 - Dr. Hugh Dryden, National Advisory Committee for Aeronautics
 - Dean John Dunning, Columbia University
 - Dr. Darol K. Froman, Los Alamos Scientific Laboratory
 - Mr. William B. Graham, RAND Corp.
 - Dr. George B. Kistiakowsky, Harvard University
 - Dr. Charles C. Lauritsen, California Institute of Technology
 - Brig. Gen. Charles A. Lindbergh, Darien, Conn.
 - Dr. Robert R. McMath, University of Michigan
 - Dr. James W. McRae, Snadia Corp.
 - Dr. J. Barkley Rosser, Cornell University
 - Prof. Jerome B. Wiesner, Massachusetts Institute of Technology
 - Dr. Herbert F. York, University of California
 - Mr. Carroll L. Zimmerman, Offutt Air Force Base, Nebr.
 - Dr. L. A. Hyland, Hughes Aircraft
 - Mr. James O. Spriggs (executive secretary), OSD
3. Advisory Group on Special Capabilities:
 - Dr. Homer J. Stewart (Chairman), California Institute of Technology
 - Dr. Robert W. Buchheim, RAND Corp.
 - Mr. H. G. Clement, RAND Corp.
 - Dr. Joseph Kaplan, University of California
 - Dr. Charles C. Lauritsen, California Institute of Technology
 - Dr. Robert R. McMath, University of Michigan
 - Dr. Richard W. Porter, General Electric Co.
 - Dr. J. Barkley Rosser, Cornell University
 - Mr. Paul A. Smith (secretary), OSD
 - Mr. James O. Spriggs (executive secretary), OSD
4. Anti-Ballistic Missiles Committee:
 - Mr. William M. Holaday (Chairman)
 - Hon. Paul D. Foote
 - Dr. William Martin, OSA R. & D.
 - Hon. Garrison Norton, Assistant Secretary Navy (Air)
 - Hon. Richard Horner, SAFRD
 - Dr. Hector Skifter (technical adviser)
 - Mr. James Bridges (technical adviser)
 - Mr. James O. Spriggs (executive secretary)
5. Research and Engineering Coordinating Committee on Guided Missiles:
 - Mr. J. B. Macauley (Chairman)
 - Mr. D. W. Patterson
 - Brig. Gen. A. W. Betts, USA (Office of Director of GM)
 - Maj. Gen. John P. Daley, USA
 - Rear Adm. John E. Clark, USN
 - Maj. Gen. J. S. Mills, USAF
 - Lt. Col. John O. Blackwell, USMC
6. Advisory Panel on Aeronautics:
 - Mr. William Littlewood (Chairman), American Airlines, Inc.
 - Mr. E. J. Barlow, RAND Corp.
 - Dr. R. R. McMath, University of Michigan
 - Maj. Gen. K. D. Nichols, USA (retired)
 - Mr. W. A. Parkins, Pratt & Whitney Aircraft
 - Mr. Carl A. Covington (secretary)
 - Dr. Hugh L. Dryden (Vice Chairman) NACA
 - Dr. Allen E. Puckett, Hughes Aircraft Co.
 - Mr. L. Eugene Root, Lockheed Aircraft Corp.
 - Mr. George Schairer, Boeing Airplane Co.
 - Dr. H. Guyford Stever, Massachusetts Institute of Technology
 - Mr. Philip B. Taylor, Sr., Sanderson & Porter, New York City
7. Thor-Jupiter Ad Hoc Committee:
 - Mr. William M. Holaday
 - Maj. Gen. John B. Medaris, USA, ABMA
 - Maj. Gen. Benjamin A. Schriever, USAF

NOTE.—All members who do not have a specific designation are in OSD.

ARMY

1. Army Ballistic Missiles Committee:
 - Hon. Wilber M. Brucker
 - Dr. William H. Martin
 - Lt. Gen. James M. Gavin, USA
 - Dr. Richard A. Weiss
 - Maj. Gen. John P. Daley, USA
 - Col. Robert E. Coffin, USA (secretary)
2. Army Scientific Advisory Panel, Subpanel on Firepower:
 - Maj. Gen. K. D. Nichols, USA (retired) (Chairman)
 - Dr. John R. Dunning, Columbia University
 - Dr. Alvin C. Graves, Los Alamos Scientific Laboratory
 - Dr. Charles C. Lauritsen, California Institute of Technology
 - Dr. James W. McRae, Sandia Corp.
 - Dr. Edward C. Stevenson, University of Virginia
 - Dr. William C. Tinus, Bell Telephone Laboratories, Inc.
 - Mr. William Webster, New England Electric System
 - Mr. Dean E. Wooldridge, The Ramo-Wooldridge Corp.
 - Dr. Herbert F. York, UCRL-Livermore
 - Maj. Gen. John P. Daley (military consultant)
 - Col. Robert E. Coffin (staff assistant)

NAVY

1. Navy Ballistic Missiles Committee:
 - Hon. Thomas S. Gates
 - Hon. Garrison Norton
 - Hon. J. Sinclair Armstrong
 - Vice Adm. T. S. Combs
 - Rear Adm. John E. Clark (executive member)
 - Commander Paul Backus (executive secretary)
2. Polaris, Submarine Steering Task Group:
 - Rear Adm. W. F. Raborn, BuOrd
 - Capt. J. B. Colwell, BuOrd
 - Mr. R. F. Racine (executive secretary), BuOrd
 - Mr. C. E. Evans, BuOrd
 - Capt. Levering Smith (Chairman), BuOrd
 - Mr. W. M. Hawkins, Lockheed Aircraft Corp.
 - Dr. L. N. Ridenour, Lockheed Aircraft Corp.
 - Capt. E. Arentzen, BuShips
 - Comdr. W. R. Riblett, BuShips
 - Comdr. P. H. Backus, CNO
 - Comdr. J. E. Volonte, CNO.
 - Dr. C. S. Draper, Massachusetts Institute of Technology
 - Mr. R. Ragan, Massachusetts Institute of Technology
 - Dr. H. Brown, University of California
 - Dr. A. Haussmann, Jr., University of California
 - Dr. P. M. Fye, Naval Ordnance Laboratory
 - Dr. H. Kurzweg, Naval Ordnance Laboratory
 - Mr. R. C. Berendsen, General Electric Co.
 - Mr. R. D. Geckler, Aerojet-General Corp.
 - Dr. E. R. Roberts, Aerojet-General Corp.
 - Capt. F. W. Walker, CNO.
 - Lt. Comdr. R. L. Long, CNO
 - Dr. G. H. Mechlin, Westinghouse Electric Corp.
 - Dr. W. L. Barrow, Sperry Gyroscope Co.

AIR FORCE

1. Air Force Ballistic Missile Committee:
 - Hon. James H. Douglas (chairman)
 - Mr. Richard E. Horner
 - Gen. C. E. LeMay, USAF
 - Mr. Dudley C. Sharp
 - Mr. Lyle S. Garlock
 - Brig. Gen. C. M. McCorkle
 - Col. R. E. Soper (secretary)

AIR FORCE—continued

2. Aircraft and Weapons Board:

Maj. Gen. James Ferguson (ex officio chairman)
Maj. Gen. R. P. Swofford
Maj. Gen. L. S. Stranathan
Maj. Gen. M. Lewis
Maj. Gen. F. A. Bogart
Maj. Gen. A. M. Kuhfeld
Maj. Gen. A. G. Hewitt
Maj. Gen. J. B. Cary
Maj. Gen. R. H. Carmichael
Maj. Gen. B. J. Webster
Maj. Gen. M. A. Preston
Brig. Gen. C. M. McCorkle
Brig. Gen. C. F. Dreyer
Brig. Gen. W. A. Davis
Col. R. G. Ruegg

Mr. WAGGONER. Pardon me, Mr. Counsel, there is one other committee which I neglected.

There is a committee within the office of the Secretary of Defense for the purpose of coordinating the activities of the anti-intercontinental ballistic missile programs.

Mr. WEISL. There is the field of the ICBM or the intercontinental ballistic missile.

There is the IRBM, then you have the surface-to-air missiles, the air-to-surface missiles.

The shorter range surface to surface missiles.

Missiles for the Navy, missiles for the Army, missiles for the Air Force, missiles for the United States Marine Corps.

Do you have direction of all of those fields?

Mr. HOLADAY. Yes, sir.

Mr. WEISL. And you must keep in touch with the activities from time to time of the Departments in the committees and the assistant secretaries and the personnel that have charge of the development and production of these missiles?

Mr. HOLADAY. Yes, sir.

Mr. WEISL. Do you also grant priorities?

Mr. HOLADAY. Yes, sir; I have made one priority ruling.

Mr. WEISL. Well, you do have charge of priorities?

Mr. HOLADAY. Yes, sir; I have to make these in consultation as you well realize.

Mr. WEISL. I beg your pardon, sir.

Mr. HOLADAY. I have to make these after a certain amount of consultation with the Joint Chiefs of Staff and other people who help me to determine how fast we should accelerate some particular part of the program.

Mr. WEISL. How many types of priority or what types of priorities are there in the Department of Defense in connection with missiles?

Mr. HOLADAY. This is a rather difficult thing because I am going back and picking up some. In the ballistic missile it is easy to answer your question but your question is so broad. In the ballistic missiles these programs are in a special category of priority.

The other missile programs are mostly in category 1.

Mr. WEISL. What is category 1, please?

Mr. HOLADAY. Category 1 is fitting these missiles in relation to other things such as airplanes, submarines and, things of this type.

Mr. WEISL. Well, is there such a thing as a top priority?

Mr. HOLADAY. There is—I think what you are driving at is a national priority deal with the IRBM and ICBM programs.

Mr. WEISL. What is below national priority?

Mr. HOLADAY. There is category 1.

Mr. WEISL. What is that? Is that a special priority or——

Mr. HOLADAY. It is a priority which is used to permit these people to get material and things to carry forward their work.

Mr. WEISL. Is that known as an industrial priority?

Mr. HOLADAY. No, I am not an expert in this field.

Mr. WEISL. Perhaps Mr. Waggoner can help us out.

Mr. HOLADAY. Can you help us?

Mr. WAGGONER. I think perhaps, Mr. Counsel, we should supply the answer for the record on this one because it does get into certain of the industrial priority aspects with which I am not too familiar.

(The Department of Defense memorandum on DOD priorities is as follows:)

DOD PRIORITIES

All military procurement is rated "DO" under the Office of Defense Mobilization—Business and Defense Service Administration Industrial Priority System. The symbol "DX" is a higher rating and takes precedence over "DO" rated orders, if necessary to meet required delivery dates. It should be noted that the "DX" rating, prior to January 1957, was utilized by BDSA only on a case-by-case basis to meet specific bottlenecks. In January of 1957 DOD was authorized by ODM to use "DX" rating on a program basis, i. e., to rate all contracts and orders for a program designated as of highest national importance.

As contrasted with the "DO" and "DX" ratings, the master urgency list is part of the system used internally within DOD to identify relative priority of segments of its procurement program. The system provides for four categories of urgency, "S" and categories 1, 2, and 3. "S" items, and those items in category "1" which need special attention are listed on the master urgency list in descending order.

It can generally be said that a "DX" program rating is part of the industrial priority system, indicating the highest national priority, and an "S" urgency assignment is part of a DOD system of relative urgencies assigned to guide DOD expediting and special assistance actions in cases of conflict between competing military program.

Mr. WEISL. The reason I believe that the committee might be interested in that is this: When Dr. Hagen testified here he stated that in connection with the Vanguard he was denied any priority and he stated that he believed that had he been given any priority he might have got the missile in the air before the Russians did.

So I was trying to find out, not for the purpose of cluttering the record, but for the purpose of informing the committee, just how many priorities there are, who passes on them, and who grants them.

Mr. WAGGONER. Well, Mr. Counsel, specifically, with regard to the aspect that you just mentioned, there is an industrial priority which is normally monitored by the Assistant Secretary of Defense for Supply and Logistics with the advice of the Joint Chiefs of Staff.

This is a more or less of a procurement-type priority.

It is a listing of the various major weapons systems, and while I am not familiar with the details of it, I do know that the ballistic-missile programs are sitting on the very top of that procurement policy.

Mr. WEISL. Mr. Holaday, Senator Saltonstall asked you to define how you determine or who determines what funds are available for a particular project and how those funds are allocated, whether they are made available by the Budget Director, and then by the Comp-

troller and when they are made available by either of these men who allocates those funds; do you, does the Comptroller, does the Budget Director?

We would like to make this as clear as we can.

Mr. HOLADAY. Well, I will try to help you there, sir, as much as I can, too.

AUTHORITY TO MAKE FROZEN FUNDS AVAILABLE

Once the money is appropriated as to a given amount of money to go into these programs, this amount of money is then frozen and is under our direction. In other words, if a certain amount of money is appropriated for the IRBM and the ICBM programs, this amount of money is frozen by us and is available for carrying out those programs.

Now, in approving the expenditure of this money, we retain the flexibility to change whether it would all go into production or whether we might use more of it on research and development. We have the flexibility, once the money is appropriated for these programs.

Mr. WEISL. When you say "we," I know you consult other people, but as the Director of this program, you have the ultimate power and responsibility?

Mr. HOLADAY. Yes, sir; I have to sign for all of them; that is right.

Mr. WEISL. Does the Comptroller allocate those funds?

Mr. HOLADAY. The Comptroller is in, of course, on the initial discussions where we are setting the policies, following the direction of the Secretary as to the amount of money, and you have him, of course, in the position of apportioning the money after we have approved it. He has this—

Mr. WEISL. Well, after the funds are allocated, can you direct the Comptroller to distribute those funds under your direction?

Mr. HOLADAY. No; I do not have that authority. I believe you have handed the Comptroller certain authority by action of Congress. Which makes it—

Mr. WEISL. Sir?

Mr. HOLADAY. The action of Congress makes the Comptroller, as I understand it, responsible for the final apportionment of the money.

Mr. WEISL. So that the Comptroller can withhold funds, even though you direct that they be used, where Congress makes those funds available?

Mr. HOLADAY. I don't believe he would do this.

Mr. WEISL. I am not saying whether he would do this or not. Has he the power to do it, even though you direct him to do it?

Mr. HOLADAY. I would have to go to the Secretary of Defense to resolve that particular difficulty, if it occurred.

Mr. WEISL. I am sorry, Mr. Holaday; I did not quite hear the answer.

Mr. HOLADAY. I said that I would have to go to the Secretary of Defense to have that problem resolved, if such a thing did happen.

Mr. WEISL. Well, let us assume that you went to the Secretary of Defense, and the Secretary of Defense believed, with your concurrence, that certain funds should be allocated that are available. Could he command the Comptroller to make them available?

Mr. HOLADAY. I would say "Yes."

Mr. WEISL. And does the same apply to the Director of the Budget, Mr. Brundage?

Mr. HOLADAY. No; I don't believe the Secretary of Defense has that power over the Director of the Budget.

Mr. WEISL. Suppose Congress appropriates money for the missile program, and you and the Secretary of Defense, after hearing all of the evidence, believe that that money is urgently needed for an ICBM or an IRBM or for some other missile.

Have you the power to make that money, which has been appropriated by Congress, made available by the Director of the Budget, Mr. Brundage?

Mr. HOLADAY. Sir, to get action on that, if it was held up at this particular point, we would have to go to the President of the United States.

Mr. WEISL. Have you had money withheld, in your experience in this missile program, by either the Comptroller or the Budget Director, which had been appropriated by the Congress?

Mr. HOLADAY. To the best of my knowledge, I cannot recall any time that the money has been withheld.

Mr. WEISL. Is that true, to the best of the knowledge of your two associates, General Betts and Mr. Waggoner, who had been in the Department longer?

Mr. WAGGONER. There have been occasional instances where the people in, or the personnel in, the Comptroller's Office requested additional information, but, in every case that I can recall, as soon as the matter was brought to our attention it was merely a matter of getting together with the appropriate individuals and straightening out the matter, and the program continued on.

Mr. WEISL. Who are the appropriate individuals that you have to get in touch with?

Mr. WAGGONER. Well, when the item is of major consequence, it results in discussions between, and I am referring now to the period prior to Mr. Holaday, to discussions between Mr. Murphree and Mr. McNeil.

Mr. WEISL. In the past, did not the Bureau of the Budget hold up funds for nuclear rockets and for nuclear airplanes?

Mr. WAGGONER. Being in the guided-missile business, sir, I cannot answer.

Mr. WEISL. You do not, either, General Betts?

General BETTS. I cannot respond to that.

Mr. WEISL. Now, with all of these—pardon me, Mr. Holaday; who appointed these various committees that have been listed here by you and your associates?

Mr. HOLADAY. The ballistic—

Mr. WEISL. Don't go into each of them, but I mean who appointed most of them or all of them? Are they appointed by the Secretary of Defense?

Mr. HOLADAY. By the Secretary of Defense.

Mr. WEISL. You have no voice in the appointments?

Mr. HOLADAY. I certainly make the recommendations.

Mr. WEISL. And the Secretary can change the appointments from time to time, if he wishes to?

Mr. HOLADAY. Yes, sir. I have made certain recommendations for additions to these committees, and he has abided by my recommendation.

Mr. WEISL. You mean you have created new committees or put additional men on existing committees?

Mr. HOLADAY. Put new men on and, in certain cases, dropped certain people off.

Mr. WEISL. Yes, sir. Now, with all of those duties and responsibilities, keeping in touch with the missile program in the Defense Department, in the research department, in the various military departments, what kind of an organization do you have to help you do this?

Mr. HOLADAY. I had, until the Office was modified, I believe, 8 or 9 people.

In addition to Mr. Waggoner and General Betts, I had 3 military representatives; 1 from the Army, the Navy and Air Force, and, in addition to this, some 3 or 4 other civil servants to assist me. We now have added to this, until there is probably in the neighborhood of 14 or 15. I could make this complete, if you would like to have me put it into the record.

Mr. WEISL. Now, your relationship to these committees, as I understand it, is to keep in touch with them, to seek their advice and their help in connection with all your problems connected with missiles.

Mr. HOLADAY. The Scientific Advisory Committee: I present them with problems to advise me and recommend to me their best solution of them. They also have the perfect freedom to make any recommendations that they feel that I should have.

Mr. WEISL. Do they have any authority to issue directives, sir?

Mr. HOLADAY. No, sir.

Mr. WEISL. Do they have any authority to issue any orders?

Mr. HOLADAY. No, sir.

MR. HOLADAY'S PUBLIC POSITION ON MISSILE PROGRESS

Mr. WEISL. Now, Mr. Holaday, since your appointment as Director of the missile program, you have made known to the public in public addresses your estimate and your views of the missile program; have you not?

Mr. HOLADAY. I have—I believe you have reference to one speech which I have given.

Mr. WEISL. Yes, sir.

On December 5, 1957, you made a speech which was publicly reported throughout the world concerning our missile and satellite program; did you not?

Mr. HOLADAY. Yes, sir.

Mr. WEISL. And in order that the record be clear, in that speech you did point out the danger and the necessity for the United States to tighten its belt and to meet this challenge?

Mr. HOLADAY. Yes, sir.

Mr. WEISL. In that speech you made the following statement:

Many of you here tonight have an active part in the missile program—you were talking to the American Rocket Society?

Mr. HOLADAY. Yes, sir.

Mr. WEISL. You said:

You know as well as I do that we are not as far behind as some of our journalistic friends and commentators think we are.

To listen to some of these so-called experts who are backed by half-information, all seems lost, and we have sunk to a position of second-rate power in the world. Such is not the case.

My staff and myself have examined as far back as we could the journalistic comments about Russia's position in this field vis-a-vis our position, and we have found, Mr. Holaday, that our journalistic friends as far back as 1947, and continuing to date, have been far ahead of the Government officials in estimating the strength and the leadership of Russia in the missile and satellite field.

May I call your attention to statements made by the Chairman of the Atomic Energy Commission 2 years ago, Mr. Strauss, in which he stated as follows:

In 5 years

this was 2 years ago—

our lead in the training of scientists and engineers may be wiped out and in 10 years we will be hopelessly outstripped unless immediate steps are taken to correct it.

That was 2 years ago.

Would you say, judging from recent events, that the situation is better now than it was when Admiral Strauss spoke?

Mr. HOLADAY. No, sir; I agree with him 100 percent, and in the latter part of the speech I think that you will find that I have definitely confirmed that statement.

Mr. WEISL. I will put the speech in the record, Mr. Holaday, and give it to you and let you correct every statement that I make or amend it or add to it.

Senator JOHNSON. Will counsel give the date of the speech?

Mr. WEISL. The date of the speech is December 5, 1957, approximately 1 week ago.

Senator JOHNSON. That was 1 day before the Vanguard failure.

Mr. WEISL. Let me call your attention to another statement made by Gordon Dean, who preceded Mr. Strauss as Chairman of the Atomic Energy Commission, and I quote:

We have consistently underrated the technological and production achievements of the Russians and it is now time we stopped doing it. Her performance during and since World War II is there for us to see and it is time we started to believe what we see.

You agree with that statement made by Chairman Dean who preceded Chairman Strauss?

Mr. HOLADAY. Yes, sir.

Mr. WEISL. As head of the Atomic Energy Commission?

Mr. HOLADAY. Yes, sir.

Mr. WEISL. Don't you think it adds to the complacency of the people when you accuse our journalistic friends of speaking half-truths?

Mr. HOLADAY. I think you should separate the sentence.

I was not criticizing the press. I was attempting here, sir, to indicate that we must roll up our sleeves and go to work.

Mr. WEISL. Yes, sir.

In that same address you stated as follows:

We have hardware today which is easily capable of launching large satellites. So when I say that many of you here tonight will participate in the satellite program, I mean that we will be able to have large satellites whenever we want them.

Do you think that was a fair statement?

Mr. HOLADAY. Yes, sir; I would like to answer that in detail in executive session, sir.

Mr. WEISL. This is a correct quote from your speech; is it not?

Mr. HOLADAY. Yes, sir.

Senator SYMINGTON. Mr. Counsel, will you read that again?

I am sorry; I missed it.

Senator JOHNSON. Senator Symington asked that you reread the portion of the speech that you just read.

Senator SYMINGTON. Thank you, Mr. Chairman.

Mr. WEISL (reading):

We have hardware today which is easily capable of launching large satellites. So when I say that many of you here tonight will participate in the satellite program, I mean that we will be able to have large satellites whenever we want them.

Senator JOHNSON. Now, Mr. Holaday, would you please place in the record your reasons for wanting to answer this public statement, saying we could fire big satellites any time we wanted to, why you would want to answer that in executive session, so the record will be clear and the committee may know?

Mr. HOLADAY. Well—

Senator JOHNSON. The reason you chose to answer counsel's question in executive session?

Mr. HOLADAY. In answering the question in detail, I will have to talk about military possibilities and military equipment, and I do not believe that I can disclose that in an open meeting.

I would like very much to give the information to you in a closed session, it all being classified, sir.

Senator JOHNSON. Military equipment and military matters that, in your opinion, the Russians do not already know?

Mr. HOLADAY. Well, I don't believe they know all the plans.

I don't know exactly what the Russians know, but it is my feeling that it would be of considerable help to the Russians if I disclosed to the public exactly the possibilities we have here for launching this type of a satellite.

Senator JOHNSON. And the reasons that you held back deliberately?

Mr. HOLADAY. Yes, sir.

Senator JOHNSON. Thank you.

Then, Mr. Holaday, we will hear you in executive session and we will ask that the Defense Department be prepared to promptly review your testimony in order that all of it which does not breach security may be made public as promptly as possible. Is that agreeable to you?

Mr. HOLADAY. That is very agreeable.

Senator JOHNSON. Thank you.

You may proceed, counsel.

Mr. WEISL. In that same address, Mr. Holaday, you stated as follows, and I quote:

When we are assured of an adequate IRBM capability, and an ICBM system with the necessary support equipment and stockpile of missiles, then we intend

to jump into space. To do so beforehand would be like trying to lock the front door and let the back door stay open.

Is that a direct quote?

Mr. HOLADAY. Yes, sir. And there is —

Mr. WEISL. You do not believe we should place any satellite in orbit until we get an adequate supply of ICBM's and IRBM's?

Mr. HOLADAY. Mr. Counsel, will you please finish the rest of the quote?

Mr. WEISL (reading):

This does not mean that we will discontinue space work. We will have an effective and continuing program. But missiles will be our No. 1 job.

Mr. HOLADAY. I agree with that statement.

Mr. WEISL. I might say that the Air Force, I believe, and the Army, do not agree. They believe that the space program should have equal priority with the missile program, and that each is not exclusive of the other in development or operation in point of time or otherwise.

Mr. HOLADAY. That is probably true, sir. I may have to change my mind.

Senator JOHNSON. I did not hear that answer.

Mr. HOLADAY. I say that is true. I may even have to change my mind.

Senator JOHNSON. But you have not changed it?

Mr. HOLADAY. At the present time, personally, I believe that the IRBM and the ICBM missiles are more important to the American public.

Senator JOHNSON. But you still believe that we could launch a satellite if we wanted to, and could have had it prior to their launching one?

Mr. HOLADAY. Launching prior to theirs?

Senator JOHNSON. Yes.

Mr. HOLADAY. This is going back into past history.

Senator JOHNSON. Yes. We are going to have to do a little of that as we go along. [Laughter.]

Mr. HOLADAY. Well, I am sure that since I affirm my previous statements, that we can launch satellites, I think this is possible, and I think a sound and basic program here on satellites and space travel is part of what we will need for continuation of even some of our ICBM work, particularly leading into the future.

It is a question of where we put our emphasis. My statement made at that particular time was to indicate that I believe our emphasis must be placed on the ballistic missiles at this time, carrying along with it a sound and basic space-travel program.

Senator JOHNSON. All I want to clear up is that I gathered from this article that you felt that this country could send large satellites into space any time it wanted to; and, of course, I was very interested, if that were true, if we could do it, why we did not do it.

Mr. HOLADAY. Well, sir, what I stated there was the ability we have. When I say "any time," this does not mean tomorrow. If you asked me to put one of these large satellites up, that this could be done.

We have the ability to do it, but we would still require the engineers to completely put this material together in order to launch the satellite.

Senator JOHNSON. Thank you.

Senator SYMINGTON. Mr. Chairman, may I ask a question there for clarification, one question?

Senator JOHNSON. Senator Symington.

Senator SYMINGTON. Mr. Secretary, Mr. Director, you said you could not discuss this further in an open session because you would have to discuss our military possibilities.

On the other hand, as I listened to counsel read the quote, you say we can do it now.

Would you want to say that you would have to discuss our military actualities, if we can do it now? Would you want to rephrase your answer?

Mr. HOLADAY. What particularly, Senator, I am trying to stay away from is to disclose the combinations of military missiles that we would use in an attempt of this kind.

Senator SYMINGTON. Just let me repeat my question.

You said that in order to discuss it, you would prefer to discuss it in executive session because you would have to discuss military possibilities.

As I listened to the counsel, you gave the impression to the American people that we could put the satellite up at this time if we wanted to.

My question is, therefore, would we not listen to you on military actualities in executive session instead of military possibilities?

Mr. HOLADAY. Yes, sir.

Senator SYMINGTON. Thank you.

Senator JOHNSON. Proceed, Counsel.

CLARIFICATION OF STATEMENT THAT ATLAS WAS OPERATIONAL

Mr. WEISL. Mr. Holaday, in that same address you stated, and I quote:

Atlas, our first ICBM to become operational, was given a top level priority long before sputniks were heard of.

Is the Atlas operational?

Mr. HOLADAY. To become operational.

Mr. WEISL. Well, you say "Atlas, our first ICBM to become operational."

Mr. HOLADAY. That is right.

Mr. WEISL. Would that not indicate to the average layman that we have an operational Atlas?

Mr. HOLADAY. Sir?

Mr. WEISL. I quote the language exactly.

Mr. HOLADAY. I say "to become operational."

Mr. WEISL. No; you say "our first ICBM to become operational was given to top level priority long before sputniks were heard of."

Mr. HOLADAY. That is right. It is the first ICBM to become operational.

Mr. WEISL. You could have said that the ICBM "will become operational," couldn't you have said that, or "which will become operational," so that the average unsophisticated or even sophisticated layman could not be misled into believing that we have an operational ICBM?

Mr. HOLADAY. This is semantics that we are into. There was no attempt on my part to mislead the public.

Mr. WEISL. I am sure of that, Mr. Holaday. On the other hand, you do believe that responsible public officials should exercise great care in order not to mislead the public or give them a sense of complacency as to the present posture in which this country finds itself, do you not?

Mr. HOLADAY. That is true. I agree with you as to our responsibility.

Mr. WEISL. As a matter of fact, the Atlas has never been tested fully?

Mr. HOLADAY. We have not had a successful flight of the Atlas, you are correct.

Mr. WEISL. Well, don't you think—and I am not doing this, I assure you, Mr. Holaday, to criticize or to badger you, but I do believe the committee and the public want to feel that they can understand what responsible officials tell them.

Don't you think that it was a little or could be misleading to say, "Atlas, our first ICBM to become operational, was given a top-level priority long before sputniks were heard of," when we know that Atlas has never been tested successfully?

Now, Mr. Holaday, in connection—

Senator JOHNSON. Does he desire to respond to that statement?

Mr. HOLADAY. Well, I didn't know whether it was better for me to respond or to let it go. [Laughter.]

Senator JOHNSON. That is a matter on which you are at liberty to exercise your own judgment. I want to give you the opportunity, though, if you would care to.

Mr. HOLADAY. I would, Mr. Chairman, like to make this statement: I was talking that evening primarily to scientists and engineers. Probably half of the people there I knew personally. We do have this difficulty of talking to people of this type and then having the same material reinterpreted again to the entire public, and it makes it very difficult for you to talk to scientists and engineers where you do have a feeling of understanding, and still have that same information reproduced into the press.

I understand the difficulty. I think, as you pointed out to me, Mr. Counsel, it would be better if I never gave a speech. I think that is very good advice.

On the other side, I feel like I have a responsibility to the public, and certainly to my engineering and scientific friends.

Mr. WEISL. I am sure of that, Mr. Holaday, but this was a public address. This was not a closed, secret session with scientists.

Mr. HOLADAY. Well, it was not a closed session; that is true.

Mr. WEISL. And there were reporters there. And wasn't the speech broadcast over the radio?

Mr. HOLADAY. No, sir; no, sir.

VIEWS OF THE SCIENTIFIC COMMUNITY

Mr. WEISL. Now, in connection with your view that the satellite program should have a second position to the ballistic-missile program, and in connection with other matters relating to the missile program, Senator Johnson's staff and myself have written letters and interviewed approximately 75 people in industry connected with this program, and also scientists and technologists working on the program,

both in industry and in Government, and I would like to read to you some of the responses in that connection that we have received, and ask your comment, if you care to make any, thereon.

Are you familiar with the National Advisory Committee for Aeronautics, Lewis Flight Propulsion Laboratory?

Mr. HOLADAY. Yes, sir. I am a member of one of their committees.

Mr. WEISL. And that is located in Langley Aeronautic—Langley Field, Va.?

Mr. HOLADAY. Well, the Lewis Laboratory is located in Cleveland, sir.

Mr. WEISL. Has it a status in any way, directly or indirectly, with the Government?

Mr. HOLADAY. Yes, sir.

Mr. WEISL. The Associate Director of that enterprise wrote to us in a letter dated December 11, the day before yesterday, as follows, and I quote:

I am most deeply concerned about the current status of research and development on advanced missiles, satellites and vehicles. The crash program emphasis on the current ballistic missiles has created an unbalance in the national program so that emphasis and expenditures for research and development on advanced systems have been inadequate.

We are now faced, I believe, with the necessity of creating a crash program of research and development on advanced missile systems, satellites, and space vehicles.

Does that not indicate that that organization of which you are a member believes that there should be a crash program on all three, satellites, ballistic missiles, and space vehicles?

Mr. HOLADAY. Well, I interpret what the man says—who wrote the letter?

Mr. WEISL. Abe Silverstein, Associate Director.

Mr. HOLADAY. Yes.

Mr. WEISL. National Advisory Committee for Aeronautics, Lewis Flight Propulsion Laboratory, 21000 Brookpark Road, Cleveland, Ohio.

CONCURS IN VIEW OF INCREASED NEED FOR RESEARCH AND DEVELOPMENT

Mr. HOLADAY. Yes, sir. I know Mr. Silverstein quite well.

I believe, as I interpret what he says, sir, and it may be correct or incorrect, that he is talking about the increased need of research and development. This, I concur 100 percent with Mr. Silverstein in the need of greater research and development; whether it is in space, whether it is on materials, whether it is in nuclear energy, we do need this increased effort.

Mr. WEISL. He is not talking about increased effort. He is talking about a crash program.

Mr. HOLADAY. A crash on research and development.

Mr. WEISL. Yes, sir.

May I read it again to you?

Mr. HOLADAY. Yes, sir.

Mr. WEISL. I will give you the letter so that you can have it after this is over. I will read it again. He used the words:

We are now faced with the necessity of creating a crash program of research and development on advanced missile systems, satellites, and other space vehicles.

(The letter from Mr. Silverstein referred to above follows.)

NATIONAL ADVISORY COMMITTEE FOR AERONAUTICS,
LEWIS FLIGHT PROPULSION LABORATORY,
Cleveland, Ohio, December 11, 1957.

UNITED STATES SENATE,
COMMITTEE ON ARMED SERVICES,
SENATE PREPAREDNESS INVESTIGATING SUBCOMMITTEE,
Washington, D. C.
(Attention: Edwin L. Weisl, special counsel.)

DEAR SIR: I appreciate this opportunity for serving the Senate Preparedness Subcommittee. Before explicitly answering the four questions of your inquiry I should like briefly to review my participation in the current missile and satellite programs.

As you know, these present programs are largely directed toward the development and construction of hardware such as rockets, guidance systems, and structures and the assembly of these components into missiles. In the propulsion field in which I am especially qualified the programs have required no major basic research effort since the rocket engines are scaled-up developments of earlier engines in which the basic technology was reasonably well established.

As Associate Director of the Lewis Flight Propulsion Laboratory of the NACA my thoughts and efforts have been absorbed in the creation of an advanced technology for air-breathing, rocket, and nuclear propulsion systems applicable to the next generation of aircraft, missiles, and satellites. My contact with the present development programs has, therefore, not been intimate. I have been briefed on the programs in the several defense advisory boards and committees on which I serve. I am not thoroughly informed on the administrative and operational difficulties of the various defense agencies and industries who have participated in the program.

With these qualifying remarks specific answers to your questions are as follows:

(1) I believe there has been an adequate and proper use of scientific manpower. The late start and rapid acceleration of the program required excessive manpower, but this inefficiency attends all crash programs.

(2) My personal participation in the present missile and satellite programs has been so limited that I have encountered no bottlenecks.

(3) In technical reviews of the missile program by advisory boards and committees in which I have participated no major bottlenecks in the program were revealed. Quite to the contrary one of the review groups on liquid rocket engines on which I served, commented as follows "Developments on some large liquid-rocket engines are progressing at an extremely rapid and gratifying pace. The progress made by both the Rocketdyne Division of North American Aviation, Inc. and Aerojet-General Corp. in the development of the liquid-oxygen-hydrocarbon fueled rocket in sizes up to 150,000-pound thrust reflects credit on the industry and the military services that sponsored and directed the programs."

In the satellite development the delays are believed to be caused not by bottlenecks but by the development time required to produce new rocket and guidance hardware specifically for the satellite. Ground rules enabling existing military hardware to be applied in the satellite program would have been most beneficial in expediting its progress.

(4) Little can be done effectively now to expedite the development and production of the present line of ballistic missiles. Adequate financial support as requested by the defense agencies is, of course, required. Reorganization or other expediting methods may slow down rather than speed up the program.

I am most deeply concerned about the current status of research and development on advanced missiles, satellites, and space vehicles. The "Crash program" emphasis on the current ballistic missiles has created an unbalance in the national program so that emphasis and expenditures for research and development on advanced systems have been inadequate. We are now faced, I believe, with the necessity of creating, in as orderly a way as possible, a crash program of research and development on advanced missile systems, satellites, and other space vehicles. Extreme care in organization and implementation of the effort will be required to achieve the most efficient use of our national manpower and dollar resources. The program will be costly, but is absolutely essential to our national security and to the existence of a free world.

Sincerely,

ABE SILVERSTEIN,
Associate Director.

May I read to you what the Superintendent of Atmosphere and Astrophysics of the United States Naval Research Laboratory wrote on the 9th of December of this year.

Senator JOHNSON. Could we make it abundantly clear that the witness is in complete agreement with the quotations read from the other letter?

Mr. HOLADAY. I am in agreement as I interpret it—the need of a crash program for research and development in the areas of missiles, space flight, and so forth.

Senator JOHNSON. Have you taken steps to make recommendations to insure that being brought about?

CRASH PROGRAM MUST START WITH EDUCATION

Mr. HOLADAY. Well, I would say the answer to that is, yes, in accelerating the effort. But back of this, I would like to say that we need a deeper consideration of the entire problem.

Senator JOHNSON. By whom?

Mr. HOLADAY. By all of us.

You do not accelerate research and development by just telling people to do it. We do have to create the problem, the atmosphere, and the men. While we may attempt to crash into research and development at this particular time, this is certainly one of the long-pull areas which starts with our children, and the educational system, the building up of this whole thing; so that crashing is a long pull, in my opinion.

Senator JOHNSON. So your feeling is that the crash program would involve not only our educational system and revitalizing it or reworking it, but additional men and additional money.

Mr. HOLADAY. Yes, sir.

Senator JOHNSON. Now, as Director of Missiles, have you asked for those additional men, that additional money, and have you made your suggestions as to the course our education should take?

Mr. HOLADAY. Well, sir, I certainly have been part of the increased amount of effort for research and development, which is the increase which we hope to ask for the research and development in the new budget. I do not wish to disclose the numbers at the present time. I have had many conferences with Dr. Killian since he has been in Washington, encouraging further consideration of this question of education. I sometimes personally feel that we are maybe devoting too much of the jump-here and jump-there attitude at the present time and not facing up to what I believe is very basic in this long pull, and that is this education of our youngsters to bring them forward.

We may crash here, and if we forget this problem tomorrow we may fall flat on our face. And this is what I am attempting to say here, that education, development of scientists, I think is, and should be, our No. 1 project. It is a long pull, and we should very definitely keep this in mind as to those areas which we should study and try to get all of the people in the United States to help us on this.

Senator JOHNSON. Would it be fair to say that with respect to all of those elements that would go into a crash program for research and development, you have already made your recommendations in writing?

Mr. HOLADAY. I have—I don't think I have much of it in writing sir.

Senator JOHNSON. You do not make recommendations, in your position, in writing?

Mr. HOLADAY. Yes, we write an awful lot.

Senator JOHNSON. Have you made them in writing?

Mr. HOLADAY. Not in connection with the increase on education, except in the speech which I gave in New York.

Senator JOHNSON. I am talking about all the elements that go into it as you described them, increased amounts of money, increased number of men, change in our educational system, and so forth.

Now, in your present position, and since you have made those recommendations, I assume you made them to your superior, who would be the Secretary of Defense—you report directly to him, do you not?

Mr. HOLADAY. Yes, sir.

Senator JOHNSON. Now, I do not want to prolong this. I am violating one of my own rules, and I apologize to the other members of the committee.

But I would like for you to submit at this point in the record a synopsis of the recommendations that you have made to accelerate the research and development program which would show that, in your judgment, you have recommended a crash program for research and development as envisaged by Mr. Silverstein. If you will just supply that for the record, the dates of the letters, the memos or the recommendations, the dates of the conferences, and a brief synopsis of what they pertain to, the members of this committee who study the record may read it. I think the country would want to know that as one who has assumed your responsibility, terrifying and frightening as it could be, you have already taken such steps. I think the fact that you have taken steps, if you have, would be of great comfort to our people.

Thank you, Counsel.

(The information referred to is included in the classified record of the subcommittee.)

COMPLAINT FROM NAVAL RESEARCH LABORATORY OFFICIALS

Mr. WEISL. Mr. Holaday, I have here a letter from the United States Naval Research Laboratory, which I believe is one of the oldest military laboratories in the country, signed by the Superintendent of Atmosphere and Astrophysics, Dr. Homer E. Newell, Jr. The letter will be inserted in the record.

(The material referred to is as follows:)

UNITED STATES NAVAL RESEARCH LABORATORY,
Washington, D. C., December 9, 1957.

Mr. EDWIN L. WEISL,

*Special Counsel, Senate Preparedness Investigating Subcommittee,
United States Senate, Washington, D. C.*

DEAR SIR: This letter replies to your inquiry of December 3, 1957. Before proceeding to your specific questions, I should like to make a few general remarks.

During the past 10 years I have been concerned primarily with rocket exploration of the upper atmosphere (see the enclosed report, *The Challenge to United States Leadership in Rocket Sounding of the Upper Atmosphere*), and with planning and preparing for using artificial earth satellites for geophysical and solar research. For this reason you will find that my answers to your questions

are given from the point of view of a basic research scientist rather than from the point of view of a missile engineer.

It is my opinion that a strong basic research program is essential to continuing vitality of applied research and development in missiles or any other military or peacetime applications. New facts, new ideas, new techniques, new materials, new instruments, all come from the basic research effort, and are not forthcoming in adequate abundance when the basic research lags.

Basic research is the search for new knowledge for the sake of knowledge, and can be carried out only in that spirit. It should not be confused with applied research and development, the end products of which are prescribed, often quite rigidly, in advance. Nevertheless practical applications always come from broad, vigorous, and sound basic research activities. These practical applications, however, come from unpredictable directions in unpredictable ways.

In the case of missiles, satellites, and manned space stations one can list some of the basic research areas that must be strongly prosecuted to provide necessary support to the applied research, development, and operations. These include: geophysics, particularly upper air research; solar research; astronomy and astrophysics; materials; propulsion; aerodynamics; medicine; law: rocket sounding and satellite research.

Question 1

A tremendous amount of time has been taken, during recent years especially, for the preparation and giving of briefings, reports, etc. in a struggle to keep basic research alive and to obtain the necessary support and funds. This has been particularly true in my own field of rocket exploration of the upper atmosphere. It is recognized that there will always be a need for this sort of thing, but in my opinion the amount of time required in recent years has been greatly excessive.

In this country there has not been adequate effort in rocket sounding of the upper atmosphere. There have been many important scientific problems that have lain dormant because of lack of money and personnel to attack them. I would say that the national effort has been about 50 percent of what it should have been, considering these important problems that have remained dormant. At the Naval Research Laboratory the effort, because of lack of money and personnel, has been less than 50 percent of what it should have been on the above basis.

Questions 2 and 3

The bottlenecks that I have encountered have been of three types: (a) administrative, (b) lack of money, and (c) lack of personnel. Actually there is considerable overlap between and among these categories.

(a) *Administrative*.—The Viking, which was begun in 1946, was developed as an upper air research vehicle. The rocket itself, the techniques learned, and the associated equipment developed, formed the nucleus for further development into a ballistic missile system. Nevertheless NRL never could obtain the financial support to carry out such a development. In 1952 the Laboratory pointed out to the Navy the importance of ballistic weapons to military preparedness, and showed in detail how the Viking experience and hardware could be used as the basis for the development of a medium range ballistic weapon usable from land, ship, or submarine. But such a project was never funded.

When the ballistic missile proposals failed to receive support, NRL decided to use the Viking as a supporting research vehicle to obtain data important to missile development. Because of its costliness it was difficult for NRL to fund this project, and since appeals to both the Navy and Air Force brought no support the project was about to go under, when the Vanguard program came along. It was the Viking experience and hardware that put NRL in a position to undertake the Vanguard work.

Basic research in the Department of Defense suffers by being swallowed up in and made subservient to applied research and development programs. It suffers in competing with such programs for money, personnel, facilities, and support in general. What is needed is a permanent, competent, and adequate staff of scientists at the DOD level to provide leadership in basic and applied research. By leadership I do not mean detailed direction; I mean the actual doing of high quality, imaginative, comprehensive, and dynamic research, the participation in scientific pioneering. In my opinion a purely coordinative office that is not involved in the doing will not be effective. By adequate staff, I mean something in the nature of a complete laboratory covering in a broad way physics, chemistry, and engineering. In asking that such a laboratory be placed at DOD level I am looking to securing a position for it where leadership can be asserted within the military, where the needs peculiar to basic research can be protected, where the

funding can be sufficiently stable for sound planning and operation, and where close liaison with the military can still be maintained. Laboratories like the National Bureau of Standards and the United States Naval Research Laboratory have the breadth and depth of competence and activity to provide the leadership required were they properly placed organizationally. But NRL unfortunately is buried at the very bottom of the administrative heap in the Navy's Office of Naval Research.

NRL has made a continuing effort to keep the costs of its rocket sounding program down. One approach which promises to reduce costs by large factors is the development of the Arcon and Iris rockets. Lacking Navy support for these developments, NRL found a non-DOD sponsor who agreed to fund the developments to their conclusion. Some funds were transferred to NRL, but at this juncture DOD and the Bureau of the Budget told the sponsor to leave the rocket development business to DOD. But DOD did not provide the funds needed, and the Arcon and Iris efforts ground to a halt. Arcon would have died had not the Navy learned that the Army was going to pick up the work, whereupon the necessary funds suddenly became available. Iris did come to a complete halt, and would have died had not NRL with great difficulty made available enough funds to get it moving again. More funds will be needed to exploit Iris potentialities to their fullest, but where the monies will come from is not known. It should be pointed out that the Arcon and Iris not only will be much cheaper than previously used sounding rockets of comparable performance, but also are genuine technological breakthroughs in the solid propellant rocket field. In spite of this they must struggle for their very existence.

(b) *Lack of money.*—The rocket upper atmosphere research program was a necessary prelude to satellite research. At the present time vertical rocket sounding and satellite research are complementary methods of doing space research, the former must be used for studying the atmosphere along a vertical cross section, while the satellites provide platforms for making measurements at fixed levels above the atmosphere.

The upper air rocket research program at NRL has always received strong support from the Laboratory administration. The cost of the program, however, is about twice that of a normal laboratory research program, because of the need for rockets, launchers, telemetering ground stations, special airborne equipments, and expeditions to remote locations such as the Arctic, the Antarctic, and the mid-Pacific. The cost is about \$45,000 per man per year as opposed to about \$25,000 per man per year for normal research. As a result a large fraction of the rocket sounding program has never been covered in NRL's annual budgets. To do so would have required sizeable reductions in the Laboratory's staff, which in turn would have destroyed the breadth of competence which is the Laboratory's great strength. Instead, rockets, telemeters, ground stations, etc., have been purchased out of whatever balances happened to be left toward the end of each fiscal year. Appeals to the Navy for relief from this situation have been of no avail. This hazardous fiscal policy forced upon the Laboratory has prevented sound planning for and execution of the program. What has been done has been accomplished in spite of these blocks.

Because of the fiscal policy that lack of higher level support forced upon NRL in connection with its rocket sounding program, this program was about to go under several years ago, in spite of the fact that its accomplishments had shown the NRL program to be the most comprehensive and productive such effort in the country. The program would have gone under at that time had not the International Geophysical Year rescued it. At the present time this program continues because of IGY rockets and equipment bought by the National Science Foundation. No funds are available, however, to purchase more rockets and equipment for continuing this research beyond IGY, even though there will remain many important problems to solve. To maintain continuity in the program, these new rockets must be ordered now so as to be available at the end of the current IGY effort.

The personnel in this program are highly competent scientists, and are constantly besieged with offers of jobs in industry and elsewhere. Salary increases between 30 percent and 50 percent are quite common. These men stay with the project, however, because of scientific interests, because of its dynamic and challenging nature, and because they believe they are doing something important while the proffered jobs usually would take them out of the basic research field entirely. The present lack of monetary support for the program, however, has become obvious to all and is a source of concern. Many of the men, including top level key personnel, are now looking about to decide where they should jump

when the program goes under, if it does. Time is of the essence if the program and the staff to do it are to be saved.

(c) *Lack of personnel.*—The NRL rocket sounding program started with enough people to conduct a comprehensive program that covered most of the important research problems in the field. In the case of upper air research this is essential because the various phenomena involved—pressures, temperatures, densities, winds, ionosphere, magnetic fields, the aurora, airglow, cosmic rays, the solar radiation input, and meteors—are all so interrelated that an understanding of one aspect requires knowledge of all the other aspects. For the past 5 years, however, the rocket upper air program has operated at or below half the necessary strength to do the job right. Besides the obvious effect of lowering the total effectiveness of the program, this understaffing imposes extra burdens and strains on the personnel who are available since they naturally extend themselves in a commendable but impossible effort to make up for the deficiency in manpower.

Question 4

This country's position in the field of space research would be greatly strengthened by the creation of a National Space Establishment, as recommended in a document entitled "A National Mission to Explore Outer Space." With the support of the National Academy of Sciences, this document has been presented to Dr. Killian as a recommendation of the Rocket and Satellite Research Panel.

Some of the things that such a National Space Establishment should do are:

SPACE EXPLORATION

Vehicles
Electronics systems
Communications
Tracking
Guidance
Control
Power
Logistics
Operations
Astronautics
Medicine
Law
Applications

SPACE RESEARCH

Vehicles
Electronics systems
Logistics
Operations
Earth's atmosphere

Applications

One of the first things that should be done is to strengthen the present rocket sounding program, and to put it on a sound basis financially.

It is my feeling that something similar to what the Rocket and Satellite Panel has recommended for space research would be very effective in the missile research and development field also.

I should like to conclude with a few general remarks. First about salaries. I believe that a raise in salaries for scientists is necessary, but I do not believe that the Government has to match the salaries of industry. The Government can retain competent, top quality scientists by providing (a) the opportunity to do research and engineering in dynamic, pioneering programs that are adequately supported, and (b) an adequate salary for the scientist to live in reasonable comfort and to provide his children with a good education.

Secondly, Government facilities can provide research opportunities that private enterprise cannot fit into a reasonable profit-and-loss scheme of things. Because of this and because of research freedoms that the Government can afford, the Government can get research men at lower salaries than industry, and thus can do research at a lower overall cost. On the other hand, nothing is gained if the costs are reduced to the point where the Government cannot attract and retain the top level of competence.

Finally, it is my opinion that the military have strayed too far from their primary job of defense in which they are a user of research and research products, and are attempting to prescribe the research that is to be done and even to direct the research itself. On both counts the military are incompetent to do the job. The Office of Naval Research and especially the Naval Research Laboratory have traditionally had less military interference of this type than other defense establishments with which I am familiar. The high productivity of NRL, which includes many important military applications, is strong justification for civilian scientific direction of science programs free of military interference. Let me

hasten to add, however, that it is recognized that there must be close liaison and cooperation between the scientists and the military.

Sincerely yours,

HOMER E. NEWELL, JR.

Mr. WEISL. In our letter to him we asked for the bottlenecks that impede his program. His reply is dated only the 9th of December this year.

He says:

The bottlenecks that I have encountered have been of three types: (a) administrative; (b) lack of money; and (c) lack of personnel.

And, as an illustration of the administrative lack, he quotes, that is, I quote:

The Viking, which was begun in 1946 and was developed as an upper-air research vehicle, the rocket itself, the techniques learned and the associated equipment developed, form the nucleus for further development into a ballistic system. Nevertheless, the Naval Research Laboratory could never obtain the financial support to carry out this development.

In 1952, the Laboratory pointed out to the Navy the importance of a ballistic weapon to military preparedness, and showed in detail how the Viking experience and hardware could be used as the basis for development of the medium-range ballistic missile, usable from land, ship, or submarine. But such a project was never funded.

But when the ballistic-missiles proposals failed to receive support, Naval Research Laboratory decided to use the Viking as a supporting research vehicle to obtain data important to missile development.

Because of its cost it was difficult for Naval Research Laboratory to fund this project, and since appeals to both the Navy and the Air Force brought no support, the project was about to go under when the Vanguard program came along.

Are you familiar with that situation?

Mr. HOLADAY. I am partially familiar with it. This is well before my time, as you well realize.

Mr. WEISL. According to this letter, it still exists. He goes on to state:

Basic research in the Department of Defense suffers by being swallowed up in and made subservient to applied research-and-development programs. It suffers in competing with such programs for money, for personnel, facilities, and support in general.

What is needed is a permanent, competent, and adequate staff of scientists at the Department of Defense level to provide some leadership in basic and applied research. By "leadership" I do not mean detailed direction. I mean the actual doing of high-quality, imaginative, comprehensive, and dynamic research, the participation in scientific pioneering.

Mr. HOLADAY. I believe, sir, that the announcement which Secretary McElroy discussed with you, of setting up this department within the Department of Defense on space and satellite work, was a direct answer to his recommendation.

COMPARATIVE PRIORITIES OF BALLISTICS AND SPACE-SATELLITE WORK

Mr. WEISL. Didn't you say in your public statement that space-satellite work should be second to, should wait until the ballistic missiles are developed and operational, and it was like locking the front door and keeping the back door open?

Mr. HOLADAY. I said that ballistic missiles, in my opinion, should get the most money and the most effort at the present time, that we can currently carry along a balanced space and satellite program.

Mr. WEISL. Did I misquote the statement?

Mr. HOLADAY. No, sir

Mr. WEISL. Now, in this same letter, Mr. Holaday, the gentleman from the Naval Research Laboratory states:

Finally, it is my opinion that the military have strayed too far from their primary job of defense in which they are a user of research and research products, and are attempting to prescribe the research that is to be done, and even to direct the research itself. On both counts, the military are incompetent to do the job.

The Office of Naval Research, and especially the Naval Research Laboratory, have traditionally had less military interference of this type than other defense establishments with which I am familiar.

Do you agree with that statement?

Mr. HOLADAY. Partially, Mr. Counsel. I do think that for the record at this time, and we must realize that the National Science Foundation has a responsibility for basic research, this might be a fair time to indicate the increased amount of money that has gone into these programs.

I am not now talking about definitely research and development, but the rate at which we have accelerated our expenditure of money in the missile program.

CITES FAILURE TO EMPLOY JUPITER-C FOR SATELLITE

Mr. WEISL. Well, he goes beyond money. He says the whole thing lacks imagination, leadership, competence, and direction.

Now, Mr. Holaday, we have here a letter from the head of the physics department of the University of Iowa, who for 12 years has been actively engaged in the field of missiles and rockets for high-altitude research. Here is his statement:

I believe that there is adequate scientific, engineering, and technical manpower in the United States missile and satellite field, there now exists a vast technology in the United States which can be applied to agreed national objectives.

However, the administrative handling of this potential has been painfully divisive and painfully lacking in clear, unified objectives. The very roster of missiles under development by the several services is prima facie evidence for the diffuseness of national effort and for the lack of concentration of this effort on primary needs.

In the satellite field it would have been technically feasible for the United States to place satellites in orbit at least as early as October 1956, using the Army's Jupiter-C. But the Army's proposal to do this was vetoed down within the Defense Department in the summer of 1955 in favor of having the Navy undertake the development of a complex new vehicle for that purpose.

This decision, which has been actively contested by some of us throughout the past 2 or 3 years, was defended in terms of not interfering with direct military developments. However, the true overall effect has been exactly the reverse, since a fresh set of difficult missile developments was imposed on commercial contractors, Glenn L. Martin Co., Aerojet Engineering Corp., General Central Rocket Committee—

and so forth,

who were already deeply involved in the development of purely military vehicles.

The proposed Jupiter-C system was to be assembled of rockets and other components already in existence in 1955. This system was convincingly demonstrated to be capable of placing a 15-pound payload in a satellite orbit as early as September 1956.

Even after this famous flight, the issue was treated by the Defense Department as too delicate to mention lest the precarious balance of interservice rivalry be disturbed.

I regard the Navy's Vanguard program as in competent hands, despite vastly overpublicized difficulty, such difficulties being actually normal in this difficult field. But I regard the Department of Defense's decision to proceed with the Vanguard development as thoroughly ill-advised.

That is signed by Prof. J. A. Van Allen, head of the department of physics of the University of Iowa, who for 12 years has been specializing in the field of high-altitude research.

(The letter referred to reads in full as follows:)

STATE UNIVERSITY OF IOWA,
DEPARTMENT OF PHYSICS,
Iowa City, December 9, 1957.

MR. EDWIN L. WEISL,
*Senate Preparedness Investigating Subcommittee,
Committee on Armed Services, Senate Office Building, Washington, D. C.*

DEAR MR. WEISL: This letter is in reply to yours of the 3d instant. By way of introduction, I may remark that my own special knowledge and experience in the missile and satellite field relate to the use of high-altitude rockets and satellites for scientific purposes, rather than for direct military applications. I have been actively engaged in this field for nearly 12 years, and am at present deeply involved in the national program of using rockets and satellites in the United States portion of the International Geophysical Year undertaking.

My responses to your questions are numbered to correspond to the numbered paragraphs of your inquiry.

1. I believe that there is adequate scientific, engineering and technical manpower in the United States missile and satellite field. There now exists a vast technology in the United States which can be applied to agreed national objectives. However, the administrative handling of this potential has been painfully divisive and painfully lacking in clear, unified objectives. The very roster of missiles under development by the several services is prima facie evidence for the diffuseness of national effort and for the lack of concentration of this effort on primary needs.

2. In the satellite field, it would have been technically feasible for the United States to place satellites in orbit at least as early as October 1956 using the Army's Jupiter-C. But the Army's proposal to do this was voted down within the Defense Department (in summer 1955) in favor of having the Navy undertake the development of a complex, new vehicle for the purpose. This decision, which has been actively contested by some of us throughout the past 2 or 3 years, was defended in terms of not interfering with direct military developments. However, the true overall effect has been exactly the reverse—since a fresh set of difficult missile developments was imposed on commercial contractors (Glenn L. Martin Co., Aerojet Engineering Corp., Grand Central Rocket Co., etc.) who were already deeply involved in the development of purely military vehicles. The proposed Jupiter-C system was to be assembled of rockets and other components already in existence in 1955. This system was convincingly demonstrated to be capable of placing a 15-pound payload in a satellite orbit as early as September 1956. Even after this famous flight the issue was treated by the Defense Department as too delicate to mention, lest the precarious balance of interservice rivalry be disturbed.

I regard the Navy's Vanguard program as in competent hands (despite vastly overpublicized difficulties, such difficulties being actually normal in this difficult field). But I regard the DOD's decision to proceed with the Vanguard development as thoroughly ill advised.

3. [Blank.]

4. The United States has an urgent need for the genuine unification of its missile and satellite efforts in a civilian commission having the general character of the Atomic Energy Commission. The essential features of such a Missile and Satellite Commission are as follows, in my judgment:

(a) It should have a statutory status independent of the Department of Defense.

(b) The military services should be regarded as customers (as with the AEC) but they should not possess direct control over its program, nor should their customer demands preclude a vigorous program on longer term scientific and civilian applications.

(c) It should have adequate funds provided by specific congressional action.

(d) It should operate, by contract, one or more centralized laboratories, necessary proving grounds, and other major facilities required.

(e) It should have, via the President, adequate means for requisitioning the services of military bases, ships, personnel, equipment, etc., as required.

(f) It should give such a level of support to the scientific and civilian applications of missiles and satellites as seems appropriate to the long-term national welfare. Much of this support would likely take the form of contracts to universities and to other civilian research establishments. Only in this way can

the scientific resources of the country be developed in an imaginative and profitable way for the long-term exploitation of the vital new field of exploring space and using the results and the techniques for human benefit. (The military applications, though of most immediate importance, are quite narrow and limited. Note the similarity to the work of the Atomic Energy Commission.)

I hope that these remarks may be of some value in your investigation. I may emphasize again the similarity of the national need to that which led to the establishment of the Atomic Energy Commission. The eminent success of AEC in supplying all military needs, in developing civilian applications of atomic energy, and in forwarding fundamental scientific research and education in the sciences is well known.

I believe that the Congress and the President are presented with a similar opportunity in the missile and satellite field.

Sincerely yours,

J. A. VAN ALLEN,
Head, Department of Physics.

Mr. WEISL. Do you agree with the professor?

Mr. HOLADAY. You will realize this happened before my time. But I think it should be made clear that in selecting the Vanguard project we also used some very capable scientists to advise these programs. I believe this was pointed out by Secretary Quarles.

Mr. WEISL. I know you were not in the Department in 1956, but do you agree with the professor's conclusions?

Mr. HOLADAY. As to the fact when you say—

Mr. WEISL. That it was a mistake not to let Jupiter-C launch a satellite in 1956 ahead of the Russians?

Mr. HOLADAY. Sir, in retrospect, what—

Senator JOHNSON. Would the witness answer counsel's question, please?

Mr. WEISL. You say in retrospect you do agree?

Mr. HOLADAY. If you look back now on the success of the Jupiter-C development, we would say yes, we made a mistake, or whoever made the decision, it was a mistake to have selected the Vanguard approach because the Jupiter-C has turned out to be more successful.

Mr. WEISL. Do you agree with the professor's conclusion that it really did not save anything for the military because they reimposed on Glenn Martin and Aerojet and the other rocket companies who were already involved in military work this extra burden of producing a new type revolutionary engine for the Vanguard satellite?

Mr. HOLADAY. Sir, if you had used Jupiter-C, you would have also used people directly connected with military work.

Mr. WEISL. Is it not true that in 1955 Dr. Killian, whom you have quoted, stated it was of utmost importance, psychologically and otherwise, to get a satellite in orbit before the Russians? Did he not make that statement to the Department of Defense?

Mr. HOLADAY. It is indicated in the report, I am pretty sure, I believe I have read it.

Mr. WEISL. So that it was not a question of hindsight?

Senator JOHNSON. The date of that report was 1955?

Mr. HOLADAY. I believe that is the Killian report; 1955. I do not remember the date.

Mr. WEISL. September 1955.

Senator JOHNSON. Is that correct, that in September 1955, Dr. Killian made his report and that in that report he made his recommendation? Counsel and witness agree?

Senator SYMINGTON. Mr. Chairman?

Senator JOHNSON. Senator Symington.

Senator SYMINGTON. Mr. Chairman, may I suggest, based on the letters I have read in detail from the United States Naval Research Laboratory and the questioning of able counsel as against that letter signed by Mr. Homer E. Newell, Jr., I would like to respectfully suggest to the Chair and the committee that Mr. Newell be called as a witness before this committee.

Senator JOHNSON. The chairman and staff will give consideration to that suggestion and notify members of the committee at the earliest opportunity.

Proceed, counsel.

Mr. WEISL. Are you familiar with the Ramo-Wooldridge Corp.?

Mr. HOLADAY. Yes, sir.

Mr. WEISL. Are they the principal consultants, research and scientific consultants, to the United States Air Force?

Mr. HOLADAY. That is correct.

Mr. WEISL. In the ballistic-missile field?

Mr. HOLADAY. Yes, sir.

Mr. WEISL. And they still continue to be the principal scientific and technological consultants to the United States Air Force?

Mr. HOLADAY. Yes, sir.

Mr. WEISL. I have here a letter dated December 10, 1957, from Mr. Simon Ramo.

(The letter referred to is as follows:)

THE RAMO-WOOLDRIDGE CORP.,
Los Angeles, Calif., December 10, 1957.

Mr. EDWIN L. WEISL,
Special Counsel, Preparedness Investigating Subcommittee,
Committee on Armed Services, United States Senate,
Washington, D. C.

DEAR MR. WEISL: I have just returned to my office after attending meetings out of the city for several days, and have found your letter of December 3, requesting a statement.

The attached memorandum has been prepared in response to this request. I hope that it has reached you early enough and includes such material as will prove helpful to you and your staff.

Sincerely yours,

SIMON RAMO.

MEMORANDUM IN RESPONSE TO REQUEST OF THE SPECIAL COUNSEL TO THE
SENATE PREPAREDNESS INVESTIGATING SUBCOMMITTEE

The following are answers to the specific numbered questions contained in the request of December 3, 1957.

1. The missile and satellite programs of the Nation have not used the scientific and engineering manpower of the Nation to the fullest. Although this maximum has been approached in the case of the Air Force's Thor, Atlas, and Titan programs, two other factors have existed on all programs, including the above-referenced Air Force programs, that have limited the program prior to the exhausting of the full scientific manpower resources of the Nation. These are (a) fund and facility limitations; and (b) the use of top scientific and engineering-management manpower to "sell," justify, defend, and otherwise be involved in nontechnical aspects to insure full appreciation, maximum sponsorship, and continuation of the programs. Ultimately, the technical resources of the Nation will limit our rate of progress in these and related fields, but today the much discussed shortage of engineers and scientists has not been the bottleneck.

2. In research and development work generally, the bottlenecks have been (a) too small a budget; (b) insufficient appreciation of the importance of research and development work planned and carried on well ahead of the commitment to a major weapons system; (c) well-entrenched bad habits to regard research and development as deserving only of minor sponsorship until and unless there is

fairly complete evidence that a major new weapons system based on this research and development will, indeed, be successful; and (d) the tendency to implement research and development out of procurement funds. As a general comment, it can be said that too large a fraction of the top research and development talent of the Nation is engaged in nontechnical pursuits intended to assure the stability of the teams with which these topmen are associated.

3. The chief factor in determining where we stand in missiles and satellites today is the late starting date—late compared with when these programs could have been started. This late start resulted from years of established practices to mull over, argue out (often in an atmosphere of interservice rivalry), analyse, and committee-to-death the starting of any major project. We have had this dilemma: Our pattern of operations has precluded committing to large projects early, when the job appears too speculative as to its final results; yet we have not permitted large basic research and development expenditures that in the end constitute the only means for uncovering evidence as to the potential success of new concepts. It is a small exaggeration to state that the starting of our huge ICBM and IRBM programs resulted when they did, rather than a year or two later, only due to the accidental timely appearance in the right places of certain personalities of exceptional conviction, imagination, and courage.

4. The completion of the development, production engineering, and production, and the attainment of operational capability in the existing long-range ballistic missiles can best be assured by every possible support for the competent operating organizations already built up to handle these projects. It is too late now, and dangerous in the sense of potential dislocations and schedule slippages, to attempt a complete governmental reorganization for these specific projects that are now so well along. There is no way now to go back and start over again at an earlier date. However, with regard to all follow-on projects, including improved ballistic missiles and a variety of satellites and other space weapons systems, we will progress at a faster rate only if (a) very major changes are made in Defense Department organization to eliminate interservice rivalry handicaps; (b) separate funding is provided for these major programs; (c) new procurement and research and development policies are instituted that will permit large gambles; and (d) in the long run, relatively huge expenditures are committed, compared with our present trivial ones for basic research (not tied to any specific military weapons system idea) and education. In connection with the presently existing ballistic-missile projects that are nearing completion dates in the next year or two, a 10- or 20-percent increase in funds and a smoothing out of all organizational problems above the level of the operating organizations will be sufficient to provide the maximum of support. In the case of follow-on projects, a doubling of expenditures is required, and, in the case of basic research and education, some tenfold increase is what is needed to maintain or insure superiority in our position with respect to the Soviet.

Mr. WEISL. In replying to the question, "Are there any bottlenecks?" he states, and I quote:

In research and development work generally, the bottlenecks have been (a) too small a budget; (b) insufficient appreciation of the importance of research and development work, planned and carried on well ahead of the commitment to a major weapons system; (c) well-entrenched bad habits to regard research and development as deserving only minor sponsorship until and unless there is a fairly complete evidence that a major new weapons system based on this research and development will, indeed, be successful; and (d) the tendency to implement research and development out of procurement funds.

As a general comment, it can be said that too large a fraction of the top research and development talent of the Nation is engaged in nontechnical pursuits intended to assure the stability of the teams with which these teams are associated.

Do you agree with that conclusion of Dr. Ramo?

Mr. HOLADAY. Yes, sir.

Mr. WEISL. Are you doing anything about it?

Mr. HOLADAY. Yes, sir.

Mr. WEISL. What are you doing about it?

Mr. HOLADAY. In the broadest terms, this is a part of the record which I have been asked to put in here. I have always been a very strong supporter of research and development. This will show up,

I believe, in some of the material which I am going to be able to put into the records of the work of using our advisory committees for recommending increased amounts of money for research and development.

I am talking here now about the same thing that I think Si Ramo is talking about.

Mr. WEISL. He does not speak only of money. He speaks of insufficient appreciation of the importance of research and development, and too large a fraction of the top research and development talent of the Nation engaging in nontechnical pursuits.

Mr. HOLADAY. I agree with this—correct.

Senator JOHNSON. Will counsel give Dr. Ramo's title again, and his present capacity.

RAMO DETAILS FACTORS THAT SLOWED US DOWN

Mr. WEISL. He is president of the Ramo-Wooldridge Corp., chief research and scientific consultants to the Air Force.

Senator SALTONSTALL. What is that name?

Mr. WEISL. Ramo, Ramo-Wooldridge Corp.

Senator JOHNSON. If the chief consultant to the Air Force feels that way about it, and the Director of the missiles program feels that way about it, who is it that does not feel that way about it, and why do we not get going on missiles? Who is doing this stopping?

In other words, you agree with everything he says and what he says is a severe indictment.

Mr. WEISL. He says some more things here, Mr. Chairman.

Senator JOHNSON. Then I will withhold.

Mr. WEISL. He says also:

The chief factor today in determining where we stand in missiles and satellites is the late starting date, late compared with when these programs could have been started. This late start resulted from years of established practices to mull over, argue out in an atmosphere of interservice rivalry, analyze and committee to death the starting of any major project. We have had this dilemma.

Our pattern of operation has precluded committing too large a project early when the job appears too speculative as to its final result. Yet we have not permitted large basic research and development expenditures that in the end constitute the only means for uncovering evidence as to the potential success of new concepts. It is a small exaggeration to state that the starting date of our huge ICBM and IRBM programs resulted when they did rather than a year or two later only due to the accidental timely appearance in the right places of certain personalities of exceptional conviction, imagination, and courage.

Do you agree with that?

Mr. HOLADAY. That gentleman, I believe, has reference to the recommendation from a Scientific Advisory Committee which is still advising me at the present time, which made the recommendation to proceed with the development of the IRBM and the ICBM. We still have most of those fellows, except one gentleman who died, still as members of our advisory committees.

Mr. WEISL. But he speaks of committee-ing these things to death. You still have all these committees and all these men on these committees through whom all these projects have to be cleared before you get going, do you not?

Mr. HOLADAY. No, sir.

Mr. WEISL. What do you have the committees for?

Mr. HOLADAY. For advice, as pointed out by Si Ramo. These are to keep us advised as to the technical possibilities of breakthrough.

This is our Technical Advisory Committee. The one which we have on special capabilities is a group of very great competence which advises also on possibilities of satellite work. The one ballistic missile committee is probably wrongly classified.

This is an in-house operating unit. This is where the action is taken.

Mr. WEISL. I have a letter from the Bell Telephone Laboratories, with which Secretary Quarles was connected for many years before he became the Deputy Secretary of Defense. Let me read what they say. This letter is dated December 9, 1957.

Senator JOHNSON. Counsel, could I interrupt?

Mr. WEISL. Yes, sir.

Senator JOHNSON. Without objection, I should like to have these complete letters incorporated in the record—Mr. Silverstein's complete letter and the text of Mr. Ramo's letter, and any other letters that you may read from—I should like to have them in the record so that they will be available to members of the committee and others who may be interested in seeing them.

(The Bell Telephone Laboratories letter referred to is as follows:)

BELL TELEPHONE LABORATORIES, INC.,
Whippany, N. J., December 9, 1957.

Mr. EDWIN L. WEISL,
*Special Counsel, Senate Preparedness Investigating Subcommittee,
United States Senate, Committee on Armed Services,
Washington, D. C.*

DEAR MR. WEISL: This is in reply to your letter of December 4, 1957, requesting information and comment in connection with our participation in the Nation's missile programs. Mr. S. C. Donnelly, assistant works manager of the Western Electric Co. at Burlington, N. C., has received a similar letter. Since the Bell Telephone Laboratories conducts research and development work for the Government as an agent of the Western Electric Co., and Western is both the prime contractor to the Government and the manufacturer of the Bell Laboratories' designs, Mr. Donnelly and I thought it would be helpful to your committee if we prepared this joint reply covering both the research and development and production aspects of our missile programs.

The laboratories and Western first participated in missile work by providing radar homing guidance equipment for the Navy Bat missile during World War II. We assume that this activity took place before the period of current interest to your committee, and have therefore confined this reply to the projects we have been engaged in since that time. These more recent projects are of two types, one being the series of Nike developments for the Army in which we have been responsible for the entire guided-missile weapon system, and the other being projects for the Navy and Air Force in which we have been responsible for only the guidance equipment as distinguished from the weapon system as a whole.

On the Nike projects we have been associated with the Douglas Aircraft Co. as our major subcontractor to whom we have delegated, in general, the responsibility for research, development, and production on the missile itself, together with its associated launching, handling and checkout facilities. In this capacity Douglas has carried out about one-half of the total effort on the Nike projects in both research and development and production. This reply has been coordinated with Douglas to the very limited extent consistent with prompt reply in an effort to provide a more complete picture insofar as the Nike projects are concerned. On the other projects our responsibility is limited to guidance equipment and our comments are restricted thereto.

Certain of the questions in your letter regarding schedules and quantities would require classified information for a complete reply. With the thought that this letter may be more useful to your committee if it is unclassified, we have omitted these numbers. They are, of course, available from the respective services involved.

Attached are separate documents on each of our projects which we hope will answer the questions in sections I and II of your letter. The answers are indexed in the same manner as your questions. Our response to your request for recommendations in section III of your letter is given in the following paragraphs.

III. RECOMMENDATIONS

1. There is need for more concentration of responsibility and authority.

More concentration would reverse the present trend toward increasing numbers of people in Government who must be informed before decisions can be reached. This applies to both project work and associated facilities. Once it is decided to proceed with a particular project, a single individual backed by a competent organization should have the responsibility and authority to carry out the development and production of the weapon system as a whole. His responsibility should carry through until the weapon system is in effective operational use. A situation approaching this obtained in the early days of Nike.

2. Use of overtime should be at contractor's discretion.

While recent restriction of overtime has not yet seriously affected our projects, it would seem wise for the future to allow contractors to use overtime as required to meet their obligations.

3. Longer term authorizations would be desirable.

Longer term funding would in many instances permit more expeditious and efficient management.

4. Reduction in the amount of required paperwork would speed progress.

The last attachment to this letter comprises a copy of a directive we have received since October 4, 1957, as requested in your supplementary letter dated December 5, 1957.

We sincerely hope that the information furnished with this letter will be helpful to your committee.

Very truly yours,

W. C. TINUS,
Vice President,
Bell Telephone Laboratories, Inc.

Attest:

S. C. DONNELLY,
Assistant Works Manager,
Western Electric Co., Inc.

NIKE AJAX

I. Research and development

A. *Start of research and development.*—Study started October 1944 (sponsored by Army Ordnance Corps and Army Air Force). Contract for exploratory development to prove feasibility July 1945 (sponsored by Army Ordnance). Authorized to proceed with production design for tactical use July 18, 1950.

B. *Status of research and development.*—Completed in 1953 except for product improvement based upon field experience.

C. *Overtime limitations.*—None.

D. *Adequacy of funds.*—Development progress was slowed by limited funding in the 1948-50 period.

E. *Adequacy of manpower.*—Adequate manpower was made available by delaying less urgent work.

F. *Effect of change orders.*—No changes were requested by the Army which had any important effect on the schedule.

G. *Bottlenecks.*—No insurmountable bottlenecks were encountered on this project.

II. Production

A. Letter of intent, February 19, 1951; definitive contract, March 18, 1952. Three prototype ground systems were delivered in 1952. Regular production deliveries of ground system began February 1953. Delivery of production missiles began June 1952.

B. *Production schedules.*—Original schedule called for three prototype ground equipments in 1952 and first production ground equipment deliveries beginning in February 1953. These schedules were met. The original schedule also called for delivery of production missiles beginning in 1952. Less than the scheduled quantity of missiles were delivered in 1952 for the reason given below.

C. *Factors limiting production.*—Production of missiles in the first year was held below scheduled rate due to difficulty in procuring critical instrument items of adequate quality. Production of ground equipments to meet all present Army needs was completed on schedule in September 1957. Missile production to meet Army needs is continuing.

D. *Overtime limitations.*—No overtime limitations affecting schedules in any important respect have been applied.

E. *Adequacy of funds.*—The overall production program has not been seriously hampered by lack of funds, although difficulties have been involved in maintaining production without hiatus on account of late receipt of reorders.

F. *Adequacy of manpower.*—No serious manpower problems.

G. *Effect of change orders.*—No delays due to changes requested by Army.

NIKE HERCULES

I. Research and development

A. *Start of research and development.*—Authorization for study, May 1952; authorization for research and development, June 1953.

B. *Status of research and development.*—Completed 1957 except for product improvement based upon field experience. Development of a more advanced version is also under way.

C. *Overtime restrictions.*—None.

D. *Adequacy of funds.*—Short-term piecemeal funding has been cause for concern but has not yet seriously hampered progress.

E. *Adequacy of manpower.*—No serious problem to date.

F. *Effect of change orders.*—No changes were requested by the Army which had any important effect on progress.

G. *Bottlenecks.*—No insurmountable bottlenecks have been encountered.

II. Production

A1. Contract for prototypes April 29, 1955.

B1. Prototype ground guidance systems were delivered as scheduled in early 1957. Prototype missile deliveries started in 1956 and have kept pace with test needs.

A2. Contract for production missiles April 29, 1955; contract for production ground guidance systems November 30, 1955.

B2. Delivery of production ground guidance systems began in June 1957 and are on schedule.

C. No major factors are limiting production of ground guidance systems.

D. The Department of Defense overtime limitation has been applied but has not caused a change in schedules.

E. Production has not been hampered by lack of funds.

F. Production has not been hampered by lack of manpower.

G. Production has not been delayed by changes requested by the Army.

NIKE ZEUS

I. Research and development

A. *Start of research and development.*—Original study work done on Hercules (attachment 2). Authorization for research and development, April 1955.

B. *Status of research and development.*—Basic development on both the high-power radars required and on the high-performance missile is proceeding. Rapid progress is being made on the most difficult technical problems requiring solution for an effective antiballistic missile system. Full-scale models of the missile motor with the required high performance have been ground tested. Scale models of the advanced radar antennas have been tested and the first high power transmitters are under construction.

C. *Overtime restrictions.*—None.

D. *Adequacy of funds.*—Available fiscal 1957 funds were inadequate for an accelerated program. Fiscal 1958 funds are almost adequate for optimum progress.

E. *Adequacy of manpower.*—No serious problem to date.

F. *Effect of change orders.*—No changes have been requested by the Army which had any important effect on progress.

G. *Bottlenecks.*—No bottlenecks other than those inherent in the difficult technical problems to be solved are currently delaying the program.

II. Production

No decisions have yet been made on the plan for accelerated production.

TITAN

(Weapon system 107A-2)

The participation of Western Electric Co., Inc., and Bell Telephone Laboratories, Inc., on the Titan missile project is directed toward research, development, and prototype production of radio-inertial guidance system and related ground support equipment. The work is carried out in close collaboration with the Glenn L. Martin Co. (missile contractor), Remington Rand-Univac (computer contractor) and under the technical direction of Ramo-Wooldridge Corp.

I. Research and development

A. *Start of research and development.*—Formal authorization and project initiation, letter contract dated October 18, 1955. Prior applicable work: Collaboration with Douglas Aircraft Co. on study of intermediate range ballistic missile project MX-2039 beginning June 1954. Project was withdrawn by Air Force in favor of intercontinental ballistic missile but study was completed without Air Force support and the work is largely applicable to the Titan guidance problem.

The Titan radio-inertial guidance system draws heavily on radar equipment designed for Nike Hercules.

B. *Status of research and development.*—On schedule and compatible with progress of subsystems supplied by other contractors in the program.

C. *Overtime restrictions.*—Letter dated June 17, 1957, from Air Force Ballistic Missile Office to Western Electric Co. requested 40 percent reduction in currently applied overtime with proviso that there must be no delay in schedules. This reduced the then current overtime of 12 percent to a ceiling of 8 percent, beyond which approval would be required from AFBMO.

Teletype message dated September 17, 1957, from AFBMO to Administrative Contracting Officer, New York Air Procurement District. This further limited overtime on work not in direct support of static or flight test programs to a maximum of 3 percent. On static and flight test programs the previous 8 percent ceiling remained in effect.

No further changes have been made by the Air Force in overtime requirements. However, our progress has not been hampered by these restrictions to date.

D. *Adequacy of funds.*—Progress has not been hampered by lack of funds to date.

E. *Adequacy of manpower.*—Progress has not been hampered by lack of sufficient manpower.

F. *Effect of change orders.*—No effect to date.

G. *Bottlenecks.*—No insurmountable bottlenecks have developed to date.

II. Production

A. Letter contract dated October 18, 1955; definitive contract dated October 4, 1957. These documents call for research and development together with a specified quantity of ground guidance and missile-borne guidance equipment prototype models. No production equipment beyond the prototype models has been authorized to date. Model construction (substantially of production design and produced by the Western Electric production organization) is proceeding concurrently with research and development.

B. *Status of model construction.*—Substantially in accordance with original schedule and consistent with other phases of the project.

C. *Factors limiting production.*—No abnormal factors.

D. *Overtime limitations.*—See item I-C above.

E. *Adequacy of funds.*—No problem to date.

F. *Adequacy of manpower.*—No problem to date.

G. *Effect of change orders.*—No delays.

THOR

(Weapon system 315A)

The participation of Western Electric Co., Inc., and Bell Telephone Laboratories, Inc., on the Thor missile program was directed toward research, development and prototype production of radio-inertial guidance systems and related ground support equipment. The work was carried out in close collaboration with Douglas Aircraft Co. (missile contractor), Remington Rand-Univac (computer contractor), and under the technical direction of Ramo-Wooldridge Corp.

The radio-inertial guidance system was considered by the Air Force as a backup system for an all inertial guidance system under development by another contrac-

tor. The guidance system proposed for Thor was very similar to that being developed for Titan.

I. Research and development

A. *Start of research and development.*—Formal authorization and project initiation, amendment No. 3 dated February 9, 1956, to letter contract covering our work on the Titan guidance system. (See attachment 4.) Prior applicable work, see item I-A, attachment 4—Titan.

B. *Status of research and development.*—On schedule at the time of Air Force decision to discontinue radio-inertial guidance system for Thor August 16, 1957.

C. *Overtime restrictions.*—Same as on Titan (attachment 4) prior to discontinuance of our part in the Thor program.

D. *Adequacy of funds.*—Program was not hampered by lack of funds during its existence.

E. *Adequacy of manpower.*—Sufficient.

F. *Effect of change orders.*—As noted under item I-B above, the participation of Western Electric and Bell Telephone Laboratories in the Thor program was discontinued August 16, 1957.

G. *Bottlenecks.*—No insurmountable bottlenecks prior to discontinuance of our part in the program.

II. Production

Not applicable, see above.

TERRIER GUIDED MISSILE CONTROL AND GUIDANCE EQUIPMENT AN/MSG-3

Western Electric Co. was the prime contractor for control and guidance equipment only. Terrier missiles were supplied to the Navy by another contractor.

I. Research and development

A. *Start research and development.*—Research and development and design work started under letter of intent dated July 1951.

B. *Status of research and development.*—Work completed.

C. *Overtime limitations.*—None.

D. *Adequacy of funds.*—No delays for funding.

E. *Adequacy of manpower.*—Not hampered by lack of manpower.

F. *Effect of change orders.*—No changes requested by Navy that had any important effect on schedule.

G. *Bottlenecks.*—No bottlenecks were encountered.

II. Production

A. Notice of award, June 11, 1952; definitive contract, May 26, 1954. Ten missile control and guidance equipments were started September 1954.

B. *Production schedules.*—Original schedule starting September 1954 and completing first part of 1955 was met.

C. *Factors limiting production.*—None.

D. *Overtime limitations.*—None.

E. *Adequacy of funds.*—No problem.

F. *Adequacy of manpower.*—No problem.

G. *Effect of change orders.*—No delays due to change orders.

TERRIER GUIDED MISSILE CONTROL AND GUIDANCE EQUIPMENT AN/MSG-3A

(A modification of AN/MSG-3 to extend the detection and tracking range and to permit control of a new type of Terrier missile.) Western Electric Co. is the prime contractor for control and guidance equipments only. Terrier missiles to be supplied to the Navy by another contractor.

I. Research and development

A. *Start of research and development.*—May 14, 1957, on a letter of intent.

B. *Status of research and development work.*—Development work is proceeding on schedule.

C. *Overtime limitations.*—Overtime is not authorized.

D. *Adequacy of funds.*—No delays for funding.

E. *Adequacy of manpower.*—Not hampered by lack of manpower.

F. *Effect of change orders.*—Changes in military characteristics of the ground guidance system have caused changes in scope of engineering. Since this system is to be used with a new missile, under development and not fully evaluated, changes have been and are expected to continue to be numerous.

G. *Bottlenecks*.—The answer here is most strongly influenced by the situation discussed under item F above.

II. Production

A. The letter of intent dated May 14, 1957, calls for modification of existing MSG-3 guidance and control equipments (attachment 6) and production of an additional quantity of new systems MSG-3A.

B. *Production schedules*.—Schedules not yet established.

C. *Factors limiting production*.—Agreement not yet reached on requirements or quantity of equipments. About 75 percent of components expected to be common to MSG-3 and MSG-3A. These can be ordered as soon as requirements and quantities are firm.

D. *Overtime limitations*.—No overtime is authorized.

E. *Adequacy of funds*.—No delays for funding.

F. *Adequacy of manpower*.—Not hampered by lack of manpower.

G. *Effect of change orders*.—Indeterminate.

[Telegram]

INGLEWOOD, CALIF., December 3, 1957.

From: Comdr. AFBMD HQ ARDC HQ, Inglewood, Calif.

To: Mr. J. P. Molnar, vice president, Bell Telephone Laboratories, Inc., Whippany Laboratory, Whippany, N. J.

I am concerned about maintaining the most effective effort for the ballistic missile program during the holiday period from December 20, 1957, through January 6, 1958. I realize that there are several solutions to the effective scheduling of work during this period; however, the policy you approve should receive complete study considering the schedule to be met. In adopting your policy, request you give top management attention to this potential problem.

(Signed) General SCHRIEVER.

[Telegram]

WHIPPANY, N. J., December 9, 1957.

Maj. Gen. B. A. SCHRIEVER,
WDD ARDC, Inglewood, Calif.:

Re your TWX December 3, 1957, on work scheduling over holiday period. BTL plans to continue effort at normal rate. Plant will be closed only December 25 and January 1.

J. P. MOLNAR.

Senator JOHNSON. I would like to ask the staff, as Mr. Weisl completes his questions from the letters, if they will duplicate the letters so that any member of the committee will be able to use them as background for his questions if he desires.

Mr. WEISL. Yes, sir.

Mr. HOLADAY. Mr. Chairman, could I ask that we be given copies of these, too? I think there are some very wonderful suggestions here.

RECOMMENDATIONS OF BELL LABORATORIES FOR MORE CONCENTRATION OF RESPONSIBILITY AND AUTHORITY

Mr. WEISL. I understand the Department of Defense has been given copies of most of these letters.

Mr. HOLADAY. If they have, they would be on my desk. Thank you.

Mr. WEISL. Here is a letter from the Bell Laboratories.

Senator SALTONSTALL. Mr. Chairman, might I interrupt to say I think it would be helpful if the full letter would be put in first as counsel reads it, and then have the counsel question from it so that

when we read the record, we can read the letter and then read his questions from it.

Senator JOHNSON. That is what the Chair intended to be done: that the entire text of the letters appear and that counsel's questions follow as each letter is introduced. It will appear in the record so that each member may have the text.

Furthermore, I think it would be well to duplicate the letters so that the members of the committee during their questioning period could have an opportunity to use them or the press could refer to them if they care to.

I will ask the staff to please take the letters of Mr. Silverstein, Mr. Newell, and Mr. Ramo and see that they are duplicated, if facilities are available.

Proceed, Counsel.

Mr. WEISL. In the letter from Bell Telephone Laboratories—

Mr. HOLADAY. Who is it signed by, please, the Bell Telephone letter?

Mr. WEISL. The Bell Telephone Laboratories letter is signed by W. C. Tinus, vice president, Bell Laboratories, Inc., and by S. C. Donnelly, assistant works manager, Western Electric Co.

Mr. HOLADAY. Thank you.

Mr. WEISL (reading):

RECOMMENDATION

1. There is need for more concentration of responsibility and authority. More concentration would reverse the present trend toward increasing numbers of people in Government who must be informed before decisions can be reached.

Senator JOHNSON. Will counsel give the date of that letter, please.

Mr. WEISL. The date of this letter, Mr. Chairman, is December 9, 1957.

More concentration would reverse the present trend toward increasing numbers of people in Government who must be informed before decisions can be reached. This applies to both project work and associated facilities. Once it is decided to proceed with a particular project, a single individual backed by a competent organization should have the responsibility and authority to carry out the development and production of the weapons system as a whole. The responsibility should carry through until the weapons system is in effective operation. A situation approaching this obtained in the early days.

2. Use of overtime should be at the contractor's discretion. While recent restrictions of overtime has not yet seriously affected our projects, it would seem wise for the future to allow contractors to use overtime as required to meet their obligations.

3. Longer-term authorizations would be desirable. Longer-term funding would, in many instances, permit more expeditious and efficient management.

4. Reduction in the amount of required paperwork would speed progress.

Do you agree with these recommendations?

Mr. HOLADAY. I think, in principle, sir, I would have to agree with them. They are very broad, and I think worthy of due consideration; yes, sir.

Mr. WEISL. You selected the Jupiter and the Thor to go into production; did you not?

Mr. HOLADAY. Yes, sir.

Mr. WEISL. The Jupiter is made at the—

Mr. HOLADAY. Army Ballistic Missile Agency.

Mr. WEISL. And the Director of the Research Projects Office of Patrick Air Force Base, Dr. Ernst Stuhlinger, is the director of the research in that program; is he not?

Mr. HOLADAY. No, sir.

Mr. WEISL. What is Dr. Stuhlinger's position?

Mr. HOLADAY. Patrick Air Force Base? I think you are mixed up, Counsel.

Mr. WEISL. Huntsville, Ala.?

Mr. HOLADAY. Yes, sir.

CHARGES MISSILE PROGRAM SUFFERED FROM LACK OF SUPPORTING RESEARCH

Mr. WEISL. The telegram is sent to me from the Patrick Air Force Base; but Dr. Ernst Stuhlinger is the assistant director? What is his title?

Mr. HOLADAY. I would have to check here.

Mr. WEISL. He signs it as Dr. Ernst Stuhlinger, Director, Research Projects Office, Patrick Air Force Base, Fla. You know who Dr. Stuhlinger is; do you not, Mr. Waggoner?

Mr. WAGGONER. Yes, sir.

Mr. WEISL. Who is he? What is his position?

Mr. WAGGONER. He is a member of Dr. von Braun's team. I believe he carries the title of assistant director, and he is engaged as part of the effort on the Jupiter missile program.

Mr. WEISL. He is what on the missiles program?

Mr. WAGGONER. He is engaged on the development effort on the Jupiter missile program.

Mr. WEISL. Here are the recommendations that Dr. Stuhlinger makes with reference to the missile program.

(The recommendations referred to are as follows:)

WASHINGTON, D. C., December 11, 1957.

EDWIN L. WEISL

*Senate Preparedness Investigating Subcommittee, Special Counsel,
Washington, D. C.:*

DEAR SIR: In reply to your letter of December 3, I would like to present the following answers to your questions. I am, of course, willing to have my answers identified with my name; however, I would appreciate it if my name did not appear publicly if these answers should be published.

1. Question. With respect to the missile and satellite programs, has there been an adequate and proper use of scientific manpower? If the answer is "No," please explain.

Answer. With respect to missile programs, there was a severe deficiency in the area of supporting research. Supporting research, as contrasted to basic research, is specifically undertaken to improve existing systems, and to prepare future development projects. This kind of research work should be initiated by the engineers and scientists who are actively engaged in development projects. The actual work would be done to a small part within the development projects, and to a greater extent by subcontractors. Ample capabilities for the initiation of such supporting research work exist at the Army Ballistic Missile Agency and at similar installations in the country, and a great many subcontractors would be eager and capable to carry out such work. However, there was practically no assignment, and by far not enough money, to initiate the urgently needed research work. Our country will continue to be poorly prepared for missile, satellite, and space-vehicle development projects unless the existing manpower for supporting research is utilized to a greater extent. Organizations like the Army Ballistic Missile Agency should be given a permanent research assignment to "advance the state of the art", without further specifications, but with a fixed and substantial amount of funding which is available regularly year after year.

With respect to satellite programs, the only project of this kind is Vanguard. It was accepted in 1955 from the Navy in preference to a satellite project proposed a little earlier by the Army. The reasons underlying this decision are a matter of record (deliberations and suggestions of the Stewart Committee, summer 1955).

Since the satellite capability of the Army was a direct outgrowth of an existing special flight test program, it continued to exist even though the satellite proposal was not accepted. The first Army satellite could have been launched in fall 1956. During 1956 and 1957, a number of offers were submitted by the Army ballistic missile agency through Army channels and through members of project Vanguard, suggesting that the Army proposal be accepted as a second source solution. The fact that none of these proposals was accepted until very recently shows that existing scientific manpower was not used properly and adequately with respect to the United States satellite program.

2. Question. With respect to the missile and satellite programs, please outline the bottlenecks, if any, which you have encountered in research and development work. If possible, please give specific examples.

Answer. When the IRBM, ICBM and satellite projects were initiated a few years ago, a number of technical problems existed which at that time had not been solved. Among them were rocket motors of sufficient power and reliability; a protective cover for a re-entering nose cone; a guidance system for long range missiles; vehicles powerful and precise enough to launch satellites; methods to calculate satellite orbits from observational data; and others. Today, solutions for all of these problems exist which are satisfactory at least for the time being. Although the technical solutions of these and similar problems normally determine the rate of progress of a development project, the decisive bottlenecks encountered during recent years at the Army ballistic missile agency were caused rather by the lack of a clear-cut assignment of an IRBM or satellite project; by the uncertainty whether IRBM work would be carried on or discontinued soon; and by the lack of manpower, funds and assignment for supporting research.

3. Question. With respect to the missile and satellite programs. Please outline any other bottlenecks which in your experience have impeded the development and production of missiles and satellites. If possible, please give specific examples.

Answer. In general, "too little" was done "too late." The assignment of new projects, instead of pushing vigorously the advancement of the art, followed only anxiously the monetary requirements of one of the services. The development of more powerful rocket motors should have been initiated years ago. The two existing IRBM projects, Thor and Jupiter, have been living for a full year under the threat that one of them would be discontinued soon. Instead, both should have been pushed forward, the one to fill the immediate requirements of the Armed Forces, the other one to form a powerful nucleus for further development.

To some extent, development was impeded by too much secrecy at the wrong places. Allotment of funds and personnel spaces, and assignment of new projects, should be made on the basis of past accomplishments. If these accomplishments are not known to the allotting committees, or to those who influence the decisions of the committees, wrong decisions are unavoidable. Lack of knowledge of successes and achievements had obviously caused misjudgments of the capabilities of the ABMA during the past year.

The difficulties in the Vanguard satellite project are caused, at least to a great extent, by the unrealistic attempt to carry out such a big project as a strictly scientific venture, without taking advantage of existing military projects. Had the satellite project been made part of a military project, it would have drawn the greatest benefits from the experience of an integrated team, from the availability of flight proven components, and from an almost unlimited growth potential. The scientific purpose of the IGY satellite could not have been served better than by a combination of a scientific team like the upper atmosphere research panel, and a guided missile team like the Army Ballistic Missile Agency.

4. Question. Please outline any recommendations which you may have for accelerating the development and production of missiles and satellites.

Answer. The Rocket and Satellite Research Panel, which is affiliated to the National Academy of Sciences, recently completed a plan for a national space establishment, an organization directly under the executive branch of the Government which would plan, direct, and budget all the development projects related to missiles, satellites, and space vehicles. The Senate Preparedness Investigating Subcommittee has been informed of this plan. It incorporates a proposal which suggests the maximum possible use of all existing guided missile development teams for an integrated development program. This plan visualizes guided missiles for immediate military use; guided missiles for future military use on the earth, carrying warheads, reconnaissance equipment, freight or troops; carrier vehicles for orbital missions; unmanned and manned satellites for military use

and for peaceful applications such as global weather survey, early storm warning, television relay stations, and communications; vehicles for unknown exploration of the moon; and systems for planetary exploration.

(End sec. 1.)

Dr. ERNST STUHLINGER,
Director, Research Projects Office, Patrick AFB, Fla.

WASHINGTON, D. C.

EDWIN L. WEISL,
Special Counsel, Senate Preparedness Investigating Subcommittee,
Washington, D. C.

Section 2 of 2.

Proven components, and from an almost unlimited growth potential. The scientific purpose of the IGY satellite could not have been served better than by a combination of a scientific team like the Upper Atmosphere Research Panel, and a guided-missile team like the Army Ballistic Missile Agency.

4. Question: Please outline any recommendations which you may have for accelerating the development and production of missiles and satellites.

Answer. The Rocket and Satellite Research Panel, which is affiliated to the National Academy of Sciences, recently completed a plan for a national space establishment, an organization directly under the executive branch of the Government which would plan, direct, and budget all the development projects related to missiles, satellites, and space vehicles. The Senate Preparedness Investigating Subcommittee has been informed of this plan. It incorporates a proposal which suggests the maximum possible use of all existing guided missile development teams for an integrated development program.

This plan visualizes guided missiles for immediate military use; guided missiles for future military use on the earth, carrying warheads, reconnaissance equipment, freight or troops; carrier vehicles for orbital missions; unmanned and manned satellites for military use and for peaceful applications such as global weather survey, early storm warning, television relay stations, and communications; vehicles for unmanned and manned exploration of the moon; and systems for planetary exploration. Particular attention is given to the extremely important interrelation between scientific research work and the development of systems for military use. Even though the greater part of the scientific experiments will be made without direct military purpose, the military will take the richest harvest from scientific research work. Scientific missile and space projects should therefore not be separated from military projects. Scientific projects deserve the best experience, the best components, and the best facilities which are available, and military projects should have the full benefit of the advanced thinking and experimenting of the best research scientists. Without a complete mutual integration of military and scientific missiles, satellites and space vehicle projects, both of them will suffer unduly.

The National Space Establishment should have the benefit of the advice from the developments teams, but it should make its decisions only on the basis of foresight, and optimum use of existing capabilities. Interservice rivalry should not influence those decisions.

Project assignments should not be made according to services, but according to development teams. The capabilities of a team should be judged only from its real accomplishments, and from the length of time it has been involved in successful development work, but not from mere paper studies, or from the boldness with which ultrashort development times are promised. There is ample experience now in this country to realistically estimate the time necessary for the development, lab testing, flight testing, and completion of a missile project. This experience should be utilized to the fullest extent.

Above all, it should be realized that research and development teams are the most valuable asset a country can have on its defense account. Full utilization of all of them according to a well-conceived master plan will not only be the wisest but, in the long run, also the cheapest approach to our defense problem.

Dr. ERNST STUHLINGER,
Director, Research Projects Office, Patrick Air Force Base, Fla.

Mr. WEISL (reading):

Answer. With respect to missile programs, there was a severe deficiency in the area of supporting research. Supporting research, as contrasted to basic

research, is specifically undertaken to improve existing systems and to prepare future development projects.

Mr. HOLADAY. Would you read that again, please?

Mr. WEISL. I will read the quote:

With respect to missile programs, there was a severe deficiency in the area of supporting research.

Do you agree that there was a severe deficiency in the area of supporting research in Dr. Stuhlinger's program?

Mr. HOLADAY. I guess I would have to have more information from him to understand this.

Mr. WEISL. This is not a direct quotation. The Army Ballistic Missiles Agency at similar installations throughout the country has ample capabilities for such supporting research work. Do you agree that they do?

Mr. HOLADAY. It is rather hard for me to follow these recommendations.

Mr. WEISL. Very well. Let me read from his telegram. The reason I paraphrased that was not to read the entire telegram which I will pass to the Senators, of course, and put in the record, but I now quote from the telegram:

However, there was practically no assignment and by far not enough money to initiate the urgently needed research work. Our country will continue to be poorly prepared for missiles, satellites, and space vehicle development projects unless the existing manpower for supporting research is utilized to a greater extent. Organizations like the Army Ballistic Missile Agency should be given a permanent research assignment to "advance the state of the art," without further specifications, but with a fixed and substantial amount of funding which is available regularly year after year.

Mr. HOLADAY. There is certainly merit to his suggestion. This Army Ballistic Missile Agency has carried on this type of research. The Navy carries on this type of research, and I am sure that if we continue down to the universities and organizations that have been set up, we will certainly get a number of suggestions for increasing both basic and applied research.

BASIC RESEARCH IS "FINDING OUT WHAT YOU DO NOT KNOW"

Senator JOHNSON. Senator Saltonstall would like to have you define "basic research" for the record.

Senator SALTONSTALL. Basic and supporting research, Mr. Chairman, basic research, industrial research, and supporting research, and the difference between supporting research and industrial research particularly.

Mr. HOLADAY. Sir, I think there are probably as many definitions as there are men; so I will use my own definitions, sir. The basic research is finding out what you do not know, and this is where we have to increase our knowledge. "Basic" to me is a very important part of the program.

The applied research is taking this basic know-how, new knowledge, and applying it to develop any type of new equipment.

Now, the industrial research that I think you have reference to, Senator, is the type of research which most industrial firms carry forward, and in most cases they will do a large portion of it as applied research and a small amount of basic. They in turn do some small

amount of basic in their own laboratories, but usually this is carried forward by money made available to universities to carry forward basic research.

Senator SALTONSTALL. What does supporting research mean?

Mr. HOLADAY. Supporting research, I believe, as it is used here, is the same as applied research.

Senator SYMINGTON. Mr. Chairman, may I ask one question for clarification?

Senator JOHNSON. Senator Symington.

Senator SYMINGTON. Would you describe pure research as the same as basic research?

Mr. HOLADAY. Yes, sir.

Senator SYMINGTON. Yes, sir.

Mr. WEISL. Dr. Stuhlinger goes on further on the satellite program. He states in his telegram, and I quote:

Since the satellite capability of the Army was a direct outgrowth of an existing special flight test program, it continued to exist even though the satellite proposal was not accepted. The first Army satellite could have been launched in fall 1956.

Do you wish to make any comment on that, sir?

Mr. HOLADAY. I would have to go back and look at my records. I think he is probably just a little bit early.

Mr. WEISL. Yes, sir.

Mr. HOLADAY. I would have to check very carefully on that.

Mr. WEISL. Then it continues:

The Army continued to press its program as a second source solution. The fact that none of these proposals was accepted until very recently shows that existing scientific manpower was not used properly and adequately with respect to the United States satellite program.

Do you wish to make any comment on that?

Mr. HOLADAY. No, sir.

UNCERTAINTY AS TO IRBM HAMPERED THE ARMY

Mr. WEISL. Then question No. 2:

What bottlenecks have you encountered in research and development work?

Answer. The decisive bottlenecks encountered during recent years at the Army Ballistic Missiles Agency by (a) the lack of a clear-cut assignment of an IRBM or satellite project, (b) the uncertainty whether IRBM work would be carried on or discontinued soon, (c) the lack of manpower, funds and assignment for supporting research.

Any comment on that, sir?

Mr. HOLADAY. No, sir.

Mr. WEISL. Question No. 3:

What bottlenecks have you encountered in the development and production of missiles and satellites?

Answer. A. Missiles: In general, too little was done too late. The assignment of new projects instead of pushing vigorously the advancement of the art followed only anxiously the monetary requirements of one of the services. The two existing IRBM projects, the Thor and the Jupiters, have been living for a year under the threat that one of them would be discontinued soon. Instead, both should have been pushed forward, the one to fill the immediate requirements of the Army, the other one to form a powerful nucleus for further developments.

Any comment on that, sir?

Mr. HOLADAY. The only comment that I think we should make for the record, is that the Army has no requirement for an IRBM. It is an Air Force requirement.

Mr. WEISL. You mean under its roles and missions?

Mr. HOLADAY. Yes, sir.

Mr. WEISL. But do you agree with what he said, that they should not have been under a threat that one should be discontinued and the other continued? The decision should have been made earlier?

Mr. HOLADAY. This is probably right, but I would rather agree with his statement that both of them should go forward.

Mr. WEISL. Other remarks, and I quote:

1. Development has been impeded by too much secrecy in the wrong places.

Mr. HOLADAY. I do not know what he has reference to there, "too much secrecy."

Mr. WEISL. Further I quote:

Assignment of new projects. Allotment of funds and personnel spaces should be made on the basis of past accomplishments. In the past, mistakes have been made in these decisions because of the lack of knowledge by the allotment and assignment committees.

Mr. HOLADAY. I think he is criticizing the Army organization there, is he not?

Mr. WEISL. Do you agree with him?

Mr. HOLADAY. I do not like to criticize the Army.

Senator JOHNSON. I do not imagine he likes to, but do you agree with him?

Mr. HOLADAY. I do not believe I have enough facts to comment one way or the other, Senator. I am sorry.

Mr. WEISL. Dr. Stuhlinger goes on—

Senator JOHNSON. Take notes of these complaints, though, in your new position because it is pretty important that you get the facts if these things are true.

Go ahead, Counsel.

OUR ROCKET MOTORS HAVE SUFFICIENT THRUST

Mr. WEISL (reading):

3. Development of more powerful rocket motors should have been initiated years ago.

Do you agree with that, sir?

Mr. HOLADAY. I don't know that I could agree with it. Probably in the broad view in which he said that if we had more and larger motors going, this would be desirable. I think this is right. We have progressed our motors and the size of them at a very rapid rate.

I find from my experts in the missile game that we are not handicapped by lack of thrust. We do have larger thrust motors under development.

Mr. WEISL. Have you a motor that has a thrust sufficient to place a thousand-pound satellite in orbit as the Russians have?

Mr. HOLADAY. Sir, this again becomes a very technical question as to how much thrust you have in the first stage, the second stage, the third stage, and the fourth stage.

Mr. WEISL. But it is a fact, isn't it, Mr. Holaday, that the Russians have a motor or a cluster of motors that were able to put a thousand-pound satellite in orbit?

Mr. HOLADAY. Yes, sir. I believe we have this same ability.

Mr. WEISL. We do have the same ability?

Mr. HOLADAY. I believe we do.

WE ARE PLANNING TO PUT 1,000-POUND SATELLITE INTO ORBIT

Mr. WEISL. When do you think we will put a thousand-pound satellite in orbit?

Mr. HOLADAY. We are planning that. I would not like to disclose any dates at this time.

Mr. WEISL. What is the weight of the satellite for Vanguard, that was to have been put in orbit?

Mr. HOLADAY. Twenty-one pounds.

Mr. WEISL. Twenty-one pounds?

What was the weight, Mr. Waggoner?

Wasn't the weight 4 pounds?

Mr. WAGGONER. The scientific satellite for Vanguard, the one which will be launched, is scheduled to be launched, in March to meet the full IGY requirements, is 21 pounds.

Mr. WEISL. I am talking about the one that did not go in orbit.

Mr. WAGGONER. The tracking item which has been called a satellite is 4 pounds. It is a transmitter to enable the people to track it to assure that such an item has been placed in orbit.

Mr. WEISL. That one that did not go up weighed 4 pounds?

Mr. WAGGONER. The tracking device weighed 4 pounds.

Mr. WEISL. I mean the device that we were trying to put in orbit.

Senator JOHNSON. Will the witness please try to give us the information we want?

The witness knows what we want. He is admitting it but only after he has lost us. Will counsel rephrase your question?

Mr. WEISL. Please answer it.

Mr. WAGGONER. The tracking device weighed 4 pounds.

Mr. WEISL. The tracking device we were trying to put in orbit with the Vanguard, what did it weigh?

Mr. WAGGONER. It weighed 4 pounds.

Senator JOHNSON. If it is agreeable the committee will take a recess for 5 minutes.

(Short recess.)

Senator JOHNSON. The committee will please come to order.

Mr. Holaday, you have been on the witness stand for more than 2 hours this morning, and we realize it has been quite a strain.

Therefore we felt that all of us should take a little recess. We are glad to have you back. We plan to run the hearing until about 1:15 and then recess until 2:30 this afternoon.

Counsel, will you proceed with your examination of the witness?

We thank you, Mr. Holaday, for your patience and understanding and for your willingness and ability to go through this situation.

Mr. HOLADAY. Thank you. I am very glad to cooperate. I think you have been very cooperative, too, sir.

Senator JOHNSON. Thank you.

Mr. Counsel?

Mr. WEISL. Mr. Holaday, I have read you recommendations from the Naval Research Laboratory, from some of the Army or Air Force research laboratories, scientific consultants, technological consultants, physicists, and scientists.

RECOMMENDATIONS OF MANAGER OF THE ATLAS PROGRAM

Now I would like to read some recommendations from the manufacturers, the practical people who are charged with the duty of delivering the goods for these missiles. I would like to read some recommendations made by the company that manufactures the Atlas, the ICBM missile upon which this country is relying for its defense. The document itself contains classified information and I shall therefore read only the recommendations. The complete document will be included in the classified record.

Mr. WEISL (reading):

Recommendation 1. A greater sense of urgency must somehow be engendered in the minds and reflected in the actions of everyone in the Government and throughout the hundreds of industrial organizations directly involved in the accomplishment of the Atlas program.

2. The vast majority of people concerned—

Senator JOHNSON. Mr. Counsel, I wonder if we could ask if he agrees with that statement No. 1?

Mr. HOLADAY. Yes, sir. I would appreciate if I could know who is writing this, Mr. Counsel. It is of some help to me.

Mr. WEISL. Yes, sir; Gen. James R. Dempsey, the manager of the Atlas program.

Mr. HOLADAY. Yes, sir.

Senator JOHNSON. He has answered yes to the first one.

Now proceed.

Mr. WEISL (reading):

The vast people concerned with the Atlas program are unaware of either the magnitude of the Soviets' technical program or the imminency of U. S. S. R. operational intercontinental ballistic missiles.

Any comment on that, sir?

Mr. HOLADAY. No, I don't believe so.

Senator JOHNSON. Do you believe that to be a true statement?

Mr. HOLADAY. I am not definite as to how much information they have. It may be entirely correct that they did not have all of the information. I would prefer to talk to Mr. Dempsey to find out exactly in detail what he means by that statement.

Senator JOHNSON. Do you think it would be helpful if they had as much as security would permit?

Mr. HOLADAY. Yes, sir. Those people on this program are cleared certainly in the secret and top secret, and I am sure that they are getting that type of information.

I don't know just what Mr. Dempsey has reference to.

Senator JOHNSON. It might be a good medicine for some of that lack of urgency they are talking about, might it not?

Mr. HOLADAY. I think he has a point, if he does not understand what his competition is, he certainly is in a pretty bad fix. I agree with you.

Senator JOHNSON. Thank you. Proceed, counsel.

Mr. WEISL (reading):

Further, therefore, it is recommended that a more general dissemination of information as to what the Soviets are doing in the ballistic-missile field be accomplished.

Such a program of education would lend an appropriate sense of urgency to all concerned.

Any comment, sir, on that?

Mr. HOLADAY. No.

AGREES TO NEED FOR DISSEMINATION OF INTELLIGENCE

Mr. WEISL (reading):

It is further recommended that technical intelligence as to the Soviet approaches and rates of progress in the ballistic missile field be formally disseminated throughout the establishment of a system for that purpose.

The sharing of such technical information as to Soviet progress by contractors concerned with our own ballistic programs could certainly help accelerate the development of our own missiles.

Senator JOHNSON. Do you agree with that?

Mr. HOLADAY. I think I have to agree with him; yes, sir.

Senator JOHNSON. And you agreed with the last one? I did not hear you.

Mr. HOLADAY. Yes, sir.

Mr. WEISL (reading):

One further point in the matter of disseminating information. The inter-communication of technical information between programs with our own Defense Department could be improved.

For instance, abandonment of the need-to-know restriction and reduction of security in this regard to a level of secrecy throughout the missile program would expedite such communication.

As it now is, much information useful to those active in the development of missiles is unavailable to them because they don't even know that it exists, and the people who know it exists are apparently unaware that it can be helpful in developing acceleration of our missile programs.

Mr. HOLADAY. We have a very extensive procedure and technique for the exchange of information, but I find that I must agree with him that there seems to be a mountain that we do not always get over in getting this information around.

I am very much disturbed at times in connection with the program that a man on one program is not keeping up to date in connection with the other program.

I sometimes question, however, whether this is secrecy or just the lack of people that have this necessary clearance getting around and picking up the information.

I think there is a part which industry can do on its side to see that it has its engineers around, where I am sure there is no restriction for them to get around, to find out what the results of some previous tests may have been.

This is a very complicated problem. I have been worried and working on it for quite some time. I am sure I do not have all the solutions.

Mr. WEISL (reading):

The present planning of the Government for the operational employment of the Atlas is currently known to us as less than it should be, and if we correctly understand the Soviet accomplishments in the ballistic missile field, the present Atlas program will tend to widen rather than close the gap between the United States and the Soviet ICBM capability.

That is a most serious charge that the present program will widen the gap rather than close it.

Mr. HOLADAY. He has two statements there.

One, am I correct that he talks about not being informed as to the number of units that are being used or the method of employment?

What is the interpretation of that first part of that, sir?
Will you read it again?

ATLAS PROGRAM BEING ACCELERATED

Mr. WEISL. Yes, sir. [Reading:]

The present planning of the Government for the operational employment of the Atlas as currently known to us is less than it could be, and if we correctly understand the Soviet accomplishments in the ballistic missile field, the present Atlas program will tend to widen rather than close the gap between the United States and Soviet ICBM capability.

Mr. HOLADAY. Thank you, sir. We are accelerating the Atlas program. The amount of money going into it I do not wish to disclose, but the program is being accelerated to make more units or squadrons available at an earlier date.

Senator JOHNSON. When was that decision made?

Mr. HOLADAY. That decision was touched on by Secretary McElroy. The letter has gone forward to the Air Force accelerating the program.

Senator JOHNSON. You have made a very nice statement, all of which I appreciate.

Now would you answer my question?

When was that decision made?

Mr. HOLADAY. The decision was made and reported—I believe this is correct—by Mr. McElroy during his——

Senator JOHNSON. Testimony?

Mr. HOLADAY. Testimony.

Senator JOHNSON. Did he make it in front of the microphone or did he make it before that time?

Mr. HOLADAY. No, the decision was made prior to that.

Senator JOHNSON. How long prior to that?

Mr. HOLADAY. I can't answer you, but it was several days before the Secretary came over here. This decision was made verbally. This has been confirmed in a letter from my office to the Secretary of the Air Force, after we got the details as to fitting the entire program together.

Understand that we did have to study the details here because again we have to fit the missiles, the size unit in which they are going to be deployed, the training, and the ground-support equipment.

Senator JOHNSON. What is the date of the letter in which you confirm the oral decision?

Mr. HOLADAY. I believe it is yesterday's date.

Senator JOHNSON. Yesterday, and you cannot put the letter in the record because of its secret nature?

Mr. HOLADAY. That is right.

Senator JOHNSON. But you will discuss that fully in executive session?

Mr. HOLADAY. Yes, sir.

Senator JOHNSON. Will counsel please take note of that so we can go into that further?

I congratulate you on making the decision.

Mr. WEISL. I am omitting, Mr. Holaday, some of these recommendations because my associates tell me some of them are classified, but I will show them all to you.

Mr. HOLADAY. I appreciate that. Thank you.

Mr. WEISL. Yes.

Question: Has there been any limitation imposed at any time on the use of overtime?

That was our question.

If so, has there been any change with respect thereto?

There has not at any time been a rigid not-to-exceed limitation on overtime. The use of overtime has been subject to approval by the Air Force, and from the 1st of July to the 2d of December 1957 the authority of the in-plant Air Force representative to approve overtime was limited to 9 percent.

Mr. HOLADAY. That is correct. I would like to add considerably more detail to that.

Mr. WEISL. He does add more detail.

May I read it?

Overtime in excess of 9 percent during that period required special approval by the ballistic-missiles office in Los Angeles.

Notwithstanding the percentage limitation, Convair has understood that overtime, in whatever amount, would be approved if it could be shown that program schedules would otherwise be jeopardized.

Mr. HOLADAY. Yes, sir; the statement—

Mr. WEISL. And it says that the 9-percent limitation was withdrawn on December 2, 1957?

Mr. HOLADAY. That is what I wished to add. Thank you.

Senator JOHNSON. But you do agree with the Secretary of Defense that the most serious bottleneck that he has encountered has been the limitation that had been placed on working more than 40 hours a week? Could I read you his testimony to refresh your memory:

Mr. WEISL. Can you, without breaching security, tell the committee what bottlenecks you found and what remedies you took to eliminate.

Mr. McELROY. Well, the principal bottleneck that we felt we found was the limitation on overtime in certain instances. Where that was discovered, we moved rather quickly in order to authorize overtime.

What does that mean, "authorize overtime"; more than 40 hours per week?

Mr. HOLADAY. Yes.

Senator JOHNSON. "As the service"—that means the Army, Navy, and Air Force?

Mr. HOLADAY. Yes, sir.

HOLADAY CALLS OVERTIME LIMITATIONS ONE OF PRINCIPAL BOTTLENECKS

Senator JOHNSON (reading):

As the services indicated that any such freedom from restriction would help them in speeding up their program.

Do you agree with that statement?

Mr. HOLADAY. Yes, sir.

Senator JOHNSON. And you agree that was the principal bottleneck?

Mr. HOLADAY. It is one of the principal bottlenecks.

Senator JOHNSON. And you agree on December 2 you took steps to eliminate it?

Mr. HOLADAY. Yes, sir.

Senator JOHNSON. And you agree, with the services, that will speed up the program?

Mr. HOLADAY. Yes, sir.

Senator JOHNSON. And you agree that eliminating the 40-hour-week limitation on missiles is not going to affect the cotton farmers so far as producing cotton or the auto worker or the steelworker or anybody else, that this pertains to missiles. This order pertains only to the missile work; is that not correct?

Mr. HOLADAY. That is correct.

Senator SALTONSTALL. Mr. Chairman.

Senator JOHNSON. Senator Saltonstall.

Senator SALTONSTALL. May I ask a question?

Senator JOHNSON. Senator Saltonstall.

Senator SALTONSTALL. Mr. Holaday, do I understand when you refer to overtime you mean to overtime in production as distinguished from research and development? As I understood it, there was never an overtime order put on research and development. The overtime order was put on production, and then it was withdrawn. Is that a correct statement, or is it incorrect?

Mr. HOLADAY. Thank you, Senator. It is correct.

In any of the limitations that we were putting on, we had no restriction in this research and testing phase of the program. This was our bottleneck at that particular time. We did have a restriction which applied to production.

Also, in any of the letters which went out at that time discussing overtime, we always carried the paragraph, "If these hurt you in any way, you are to call them to your attention immediately," but you are correct, Senator. Thank you for calling that to my attention.

Senator JOHNSON. But, in effect, the restriction you had on production would reflect itself indirectly as a restriction on the other; would it not?

Mr. HOLADAY. If we were short of hardware, that would be true.

Senator JOHNSON. Sure, but the point is, the American people should know that was (a) your principal bottleneck, (b) you have taken steps to remedy it, and the steps you have taken are those recommended by the services, and that the Secretary made the decision and that you concurred in it.

Mr. HOLADAY. Yes, sir.

Senator JOHNSON. Thank you.

Mr. WEISL. As I told you, I will show you the whole letter, but my censor here is directing me as to which are security and which are not. Has Convair been hampered, directly or indirectly, by lack of funds?

As indicated above, the general slow pace of Convair's work on ballistic missiles prior to mid-1954 was directly attributable to fund limitations.

In respect to the accelerated effort which commenced in mid-1954, the program has not been directly affected by lack of funds.

However, an overall atmosphere of economy prevailed prior to Sputnik I and II, which had the indirect effect of tending to weigh fiscal considerations heavier than others in the management of the program.

Then the question was asked:

What other bottlenecks, if any, have you encountered in your research and development work on each missile?

Answer. It must be understood that the development of the Atlas represents a major state of the art advancement.

Much of the system imposes greater demands for manufacturing accuracy and component reliability than comparable airplane components.

These requirements have generated need for special test facilities and test equipment of equal or greater complexity and accuracy.

The cumbersome process by which facilities are furnished by the Government to contractors has delayed procurement and activation of certain required manufacturing and test facilities.

Considering the urgency of the Atlas program, it would appear that the cautious approach, through acceptance of the contractor's justification material, has had delaying effects.

It could be mentioned that the low profit—

Well, we do not want to go into that.

Mr. HOLADAY. Could I comment on that, sir?

Mr. WEISL (reading):

It could be mentioned that the low profit margin allowed airframe contractors by the Government precludes large private investments in specialized and rapidly obsolete capital facilities.

Mr. HOLADAY. Could I comment on that, sir?

Mr. WEISL. Yes, sir.

DOES NOT KNOW WHERE DEFICIENCY OF FUNDS WAS LIMITING FACTOR

Mr. HOLADAY. I certainly appreciate very much the understanding which the gentleman who wrote the letter has indicated as to the importance here of having the ability to carry forward a good engineering job; that he must test to acquire this reliability.

I do not know of any place in which money has restricted them, at least based upon the advice of General Schriever to me, and the large amount of money which we have spent on testing devices; sure, some of them did not get built quite as quickly as they anticipated; but in the large amount of test equipment, I did not realize that we were handicapping them in any way.

We certainly have, if you have not seen them, a terrific amount of backup test facilities for programs of this type.

Mr. WEISL. We have several letters from manufacturers, which I will make available to you, Mr. Holaday, who have recommendations along similar lines. I don't want to burden the record with all of them at this time.

Mr. HOLADAY. I would certainly like to have them.

Mr. WEISL. You will have them, sir.

Mr. HOLADAY. I appreciate it, because I would like to go to those people and talk with them.

Mr. WEISL. I am sure of that, and you will have them.

Mr. HOLADAY. Thank you.

RECOMMENDATIONS OF CHANCE VOUGHT, MANUFACTURER OF REGULUS

Mr. WEISL. Here is a set of recommendations from the Chance Vought Co., which manufactures the Regulus I and Regulus II for the Navy:

The following recommendations are offered in a spirit of constructive criticism based on this contractor's experience in both the Regulus I and the Regulus II programs.

A. Within the military, strengthen and streamline the systems and agencies charged with management and procurement of modern technically complex weapons.

B. Provide the contractor with access to information that would also permit him to act fully in his capacity of weapons system contracting. Too frequently decisions are made with only limited information.

C. Reduce administrative lead time, official authorization, and funding to a predictable schedule that will permit orderly, prompt, and efficient action on all phases of the program.

D. Establish effective long-range planning and adequate long-range funding of missile programs so that the programs can proceed as fast as possible without frequent maneuvering on a fire-drill basis.

E. The present method of funding of the defense programs on a year-to-year basis greatly restricts the ability of both the Navy and its contractor to adequately plan a comprehensive continuing program.

Any program plan establishing budget for subsequent years to carry the weapons system to completion is subject to change without notice from one fiscal year to the next. This situation has resulted in no stabilized long-range Navy Department plan for the Regulus guided missile weapons system development and utilization.

F. Timely use of overtime in key areas can do much to overcome potential bottlenecks, particularly in the early stages of research and development when tests vital to the development of operational articles are being conducted.

The time consumed in following established normal channels for requested overtime can result in authorization being received too late to be effective. This contractor recommends a relaxation of limitations and restrictions now imposed as well as improvements in present overtime administration procedures, particularly in areas where the judicious use of overtime will show a potential saving in time and money.

Mr. Holaday. There are some very good suggestions there.

I believe most of them we have complied with. The question of funding these programs, particularly in missiles, we must understand that we have 18 to 24 months' lead time, and the programs have to be laid out well in advance.

This also has the complication that you cannot accelerate them quickly because of the long lead time.

Mr. WEISL. I will make available to you, Mr. Holaday, with the consent of the committee, all the communications that come to us, so that you can have before you the suggestions and recommendations and complaints of the scientists, the technologists, the contractors, and all persons that we know and whom we have contacted to give us this information.

I assure you this is done by the committee not with the idea of making your task harder, but with the idea of helping you to accelerate this program which is of such vital importance to the safety of the country.

Mr. HOLADAY. I appreciate that. I think you have acquired here some very excellent advice and recommendations. I think that we must have them, and I would like to follow through on as many as we possibly can.

SENATOR JOHNSON REQUESTS REPORT ON MANUFACTURER'S RECOMMENDATIONS

Senator JOHNSON. Mr. Holaday, I appreciate very much your constructive response to the counsel's suggestion there. If you will make a synopsis of these recommendations and give study to them, and where you feel that they are good ones, act on them and then report back to the committee on the action taken. Those that are being studied, say so, and those that you reject so indicate so that the committee will know what attention has been given and what if any action has been taken.

Mr. HOLADAY. Thank you.

Senator JOHNSON. Thank you. Mr. Weisl?

Mr. WEISL. We have communicated at the direction of the chairman with at least 100 suppliers and scientists so that we can get all sides of this story, in an effort to help you and the country to its work.

I would like to question you about the Thor-Jupiter decision. This questioning, Mr. Holaday, I assure you is not with a view of criticizing or judging this decision, but merely to arrive at the basis on which the decision was made, since it is a costly decision in terms of money.

Mr. HOLADAY. Yes, sir; I will be very glad to help.

Mr. WEISL. It will take more than 5 minutes, Mr. Chairman.

Senator JOHNSON. Go ahead.

We will run until 1:15.

Mr. WEISL. What is the range of the Thor missile?

Mr. HOLADAY. Its maximum range is 1,500 miles. It is deployed in the range from some 300 to 400 miles to 1,500 miles.

Mr. WEISL. And what is the range of the Jupiter missile? Is that approximately the same?

Mr. HOLADAY. Yes, sir.

Mr. WEISL. Is the engine that is used for the Thor any different than the engine that is used for the Jupiter?

Mr. HOLADAY. Yes, sir; slightly. They are made by the same company but there are modifications in the engines to fit to the guidance system, the method of control several months before—

Mr. WEISL. What company manufactures both engines?

Mr. HOLADAY. North American Aviation Co.

Mr. WEISL. Is there any difference in the propulsion of both these missiles?

Mr. HOLADAY. Being similar engines, they both use identically the same fuel.

Mr. WEISL. Is there any difference in the hardware, the metal?

Mr. HOLADAY. Yes, sir.

Mr. WEISL. What is the difference?

Mr. HOLADAY. It is a slight difference in the type of metal used. Either one can be used. I would not like to disclose the—

Mr. WEISL. Very well, sir. Is there any difference in the guidance system?

Mr. HOLADAY. Yes, sir; there is a difference in the guidance system. These are technical differences.

Mr. WEISL. Would you prefer to discuss them in executive session?

Mr. HOLADAY. Yes, sir.

Mr. WEISL. Is there any other difference?

Mr. HOLADAY. There is a difference in the nose cone. There is a difference in the method of fusing. There is a difference in ground support equipment. This is being studied very carefully at the present time. It might be of interest to you to know that Tuesday and Wednesday, with the Secretary of the Air Force and the Secretary of the Army, we visited both ABMA and the Chrysler Corp., and we are leaving here Sunday night, spending Monday in California, where we will study very carefully the Thor. This is to determine decisions on the ground support equipment, the method of deployment, things like that.

Mr. WEISL. Did you not study the Thor and the Jupiter before you made the decision?

Mr. HOLADAY. Yes, sir; I have very definitely. I am trying to take some of my friends with me on this, too.

Mr. WEISL. Now, in making the decision, whom did you consult?

Mr. HOLADAY. Sir, I would like to start that back with the time that I would say my hope was to get down—to get this missile system, the Jupiter and Thor—down to one missile system. I recommended to the Secretary of Defense quite some months ago that we should attempt to make a study, and I made a recommendation that this study be held at the very highest level where we could consider the facts, and I recommended that General Schriever and General Medaris and myself become a committee for making this study to see if we could reduce this down to one missile system.

RECOMMENDATIONS AS TO THOR AND JUPITER

Mr. WEISL. That is known as the Thor-Jupiter Committee?

Mr. HOLADAY. That is known as the Thor-Jupiter Committee. From the time that that committee was appointed, I spent long and detailed visits to a number of the places studying the method of manufacture and techniques, discussing with the two members of my committee the pros and cons of this whole thing.

This went on for some month and a half or 2 months in detailed discussion, and it resulted in the report that we continue with both systems.

Mr. WEISL. Excuse me, sir; may I interrupt?

Mr. HOLADAY. Yes, sir.

Mr. WEISL. Did General Schriever, who was on that committee, recommend the use of both systems?

Mr. HOLADAY. No, sir.

Mr. WEISL. Did General Medaris, who was on the committee, recommend the use of both systems?

Mr. HOLADAY. No, sir.

Mr. WEISL. And you were the only one really on that committee that recommended the use of both systems?

Mr. HOLADAY. At that particular time, sir.

Mr. WEISL. Yes, sir.

Mr. HOLADAY. I recommended that the development work should proceed—this was in September—that the development work should proceed, that we should modify the work on the Jupiter because in the early stages it had been restricted in not being able to go ahead with its ground-support work, that we modify the program, put more money into it, in order that the Army could proceed with engineering work on ground support, and that we also establish a coordination between the Army and the Air Force so that both missiles could be adjusted to use common ground-support equipment.

This required coordination work and this is the work that has been going on for quite some time.

Mr. WEISL. May I interrupt, if I may? I do not want to disturb your chain of thought, but each general recommended his own system; is that not right?

Mr. HOLADAY. That is correct, sir. Now, as we have continued the work, as you well realize, I have used lots of people for discussion as to getting down to 1 system, going ahead with 2 systems or eliminating both systems or all of these various combinations. Not

only have I had the advice and recommendations from the two generals, but I have dealt with other military people, the people on my own staff. I have taken this up with the individuals of my scientific advisory board, and I have discussed it with various secretaries, both the Army and the Air Force.

This resulted, as you well realize, when we decided to step up our program, that I made a recommendation to the Secretary of Defense that both programs should be used, and set forth my ideas why they should be used. This was discussed in quite some detail, and fortunately, the press came to my aid and assistance at this time, because it is very seldom that I am permitted to talk about what goes on in the White House, but the Vice President helped me this particular time, and the press has recorded it.

In the meeting which took place at the White House, which was on November the 27th, which was the day before we announced or Mr. McElroy announced to this group the decision, in which the Vice President was asked:

Defense Secretary McElroy announced on the Hill this afternoon that a decision had been taken last night to proceed with the production of the Thor and Jupiter at the same time. Did you have any part in that decision last night or was the White House involved?

The Vice President stated:

I was present at a meeting in the White House yesterday afternoon at which the final decision was made with regard to the Thor and Jupiter programs. I would like to say, however, that prior to that time, Secretary McElroy had consulted with the President and had laid out the preliminary lines of the decision that he submitted to the group that met in the White House.

Who was present at this meeting?

I would say Secretary McElroy; Dr. Killian; the Deputy Secretary of Defense, Mr. Quarles; Mr. Holaday; Governor Adams; the Director of the Budget.

Mr. WEISL. What Adams?

Mr. HOLADAY. Governor Adams

The Director of the Budget, Mr. Brundage; the Secretary of State, and myself.

Mr. WEISL. Of all those men, how many of them knew anything about missiles?

Mr. HOLADAY. Well, I am quite confident, or at least I hope I know something about missiles. I am sure that Mr. Quarles in his extensive experience knows something about missiles.

Senator JOHNSON. We hope so, too.

Mr. HOLADAY. Also, Secretary McElroy has become quite an expert on missiles. This goes on further to, of course, describe why these people were there as to their various backgrounds.

Mr. WEISL. So that we do not make Mr. McElroy's testimony unreliable, may I state that in his testimony he said he did not know the difference between the Thor and the Jupiter, when he testified here.

Mr. HOLADAY. As to the details that is probably correct.

Senator JOHNSON. You would not consider him an expert?

Mr. HOLADAY. I have attempted, Mr. Counsel, to give you the type of people that I have consulted with in the period of time in which I have very carefully studied the methods of manufacture, the test program, the methods for deployment, and the method of training. They all have been under very severe study since we set up the Jupiter-Thor committee.

Mr. WEISL. Have either one of the systems a trained crew to man them?

Mr. HOLADAY. No; not yet.

Senator SALTONSTALL. What was that question, please?

Senator JOHNSON. The counsel will please repeat the question.

Mr. WEISL. Have any of the systems a crew to man them; a trained crew to man them?

Senator JOHNSON. And the reply?

Mr. HOLADAY. The reply was "No."

INDIVIDUAL MEMBERS OF COMMITTEE WERE CONSULTED

Mr. WEISL. Did you consult the Ballistic Missiles Committee before you made that decision?

Mr. HOLADAY. The individual members. I did not call immediately the entire group.

Mr. WEISL. Who are the individual members?

Mr. HOLADAY. Myself, as chairman; Mr. McNeil; Dr. Foote, of Research and Engineering; McGuire of Supply and Logistics; Bryant, of Properties and Installations; and Dr. Reed of the Bureau of the Budget.

Mr. WEISL. Which one of these men are experts in the missile field?

Mr. HOLADAY. These are experts in their particular areas, as you well realize, to help supply a rounded position here as to money, manufacturing, and things of this type.

Mr. WEISL. Did they unanimously agree on the decision?

Mr. HOLADAY. Since I did not hold a——

Mr. WEISL. Did they individually agree?

Mr. HOLADAY. Yes, sir.

Mr. WEISL. Mr. McNeil agreed on the decision?

Mr. HOLADAY. Yes, sir.

Mr. WEISL. He is the Comptroller?

Mr. HOLADAY. Yes, sir.

Senator JOHNSON. There were no dissents?

Mr. HOLADAY. Not that I can recall.

Mr. WEISL. Did you consult the Joint Chiefs of Staff?

Mr. HOLADAY. The Joint Chiefs of Staff were studying several questions that we have before them at the present time in connection with employment. Some of this information was applicable to the decision, particularly that of the deployment at an early date of IRBM missiles.

Senator JOHNSON. The answer to his question is "Yes" or "No?"

Mr. HOLADAY. Yes.

Mr. WEISL. They were consulted?

Mr. HOLADAY. Yes.

Mr. WEISL. As to putting both of these missiles in production?

Mr. HOLADAY. Not specifically as to putting both of these into production. Their problem was on the method of deployment and the need for——

Mr. WEISL. Were they consulted specifically on putting both of them in production? In other words, did you call them and say, "We plan or we are considering putting both of these missiles in production. Here are the reasons why we are considering it. What is your judgment and advice that you have to use these missiles?"

Mr. HOLADAY. Sir, I specifically did talk to the Chief of Staff, the Chairman.

Senator JOHNSON. The Chairman?

Mr. HOLADAY. The Chairman.

Senator JOHNSON. That is General Twining?

Mr. HOLADAY. That is right.

GENERAL TWINING CONCURRED IN DECISION

Senator JOHNSON. And asked his recommendations?

Mr. HOLADAY. I discussed what the recommendation was that we were considering, to get his advice if he concurred in this recommendation.

Senator JOHNSON. And did he say that he thought that was a wise decision?

Mr. HOLADAY. Yes.

Senator JOHNSON. And did he concur?

Mr. HOLADAY. He concurred in our decision.

Senator JOHNSON. And you did not talk to the other Chiefs?

Mr. HOLADAY. No, sir. I personally did not.

Senator JOHNSON. Did anybody else that you know of?

Mr. HOLADAY. Not that I know of.

Senator JOHNSON. So, then, you did consult with the Chairman of the Joint Chiefs of Staff, told him what you were going to do, and asked him what he thought about it; and he said he concurred?

Mr. HOLADAY. Yes, sir.

Senator JOHNSON. Is that a fair statement?

Mr. HOLADAY. Yes, sir.

Senator JOHNSON. Thank you.

Mr. WEISL. Did you advise the Chairman of the Joint Chiefs who was, prior to becoming Chairman, the Chief of Staff of the Air Force, that the Air Force disagreed with the decision?

Mr. HOLADAY. No, sir.

Mr. WEISL. Have either of these systems been fully tested?

Senator JOHNSON. Let me see if I understand that question now.

You talked to General Twining and told him what your decision was going to be, but you did not tell him that the Air Force did not concur?

Mr. HOLADAY. No, sir.

Senator JOHNSON. You did not give him that information. Why?

Mr. HOLADAY. In previous conversations, sir, with General Twining going back to the time that we made the recommendation for continuing both programs, I had had a conversation with him as to why we were continuing with both programs, and I think he was well informed that the position taken by the two military members of my committee have been very strong for their own individual programs.

Senator JOHNSON. Do you think to have called it to his attention again would have been repetitious?

Mr. HOLADAY. Yes, sir.

Mr. WEISL. What you advised him was that both were in favor of continuing the testing and developing, not the manufacturing of both?

Mr. HOLADAY. In the previous conversations, the discussion was the fact that we had to continue the development program. We could not decide on one.

Mr. WEISL. But did you tell him, the chairman asked, whether the Air Force, of which he formerly was chief of staff, was opposed to the manufacturing or putting in production of both the systems?

Senator JOHNSON. I believe he has answered that. He said, no, he did not.

Mr. HOLADAY. I did not.

Senator JOHNSON. You did not think it was necessary to do that?

Mr. HOLADAY. No, sir.

SYSTEMS NOT FULLY TESTED

Mr. WEISL. Have either of these systems been fully tested as to guidance, propulsion, engine performance, and so forth?

Mr. HOLADAY. Speaking without too many details, because this is an open meeting, no, they have not. They have completed only about 10 percent of their research and development firing program based upon the number of missiles that have been launched compared to the total that is included in the research and development program.

Mr. WEISL. Can you give us an estimate, Mr. Holaday, of what it will cost the Nation to put both these systems in production at this time instead of continuing the development and choosing one or the other system?

Mr. HOLADAY. Again, I am in trouble on not mentioning dollars. But, sir, my best evaluation of this would be that the increased cost here is the cost of maintaining the R and D program on the second one.

Regardless of which way you go, you are maintaining rather than cutting off today that R and D program, which incidentally we could not do.

Mr. WEISL. I have not made myself clear, apparently, Mr. Holaday. No one objected in the services, as I understand it, to the continuation of the testing and development program. The only objection arose at this time to putting both programs, before they were fully tested and evaluated, into production at the same time.

And what I am asking you is, how much will the bill be to put both systems in production instead of putting one system in production after they are each tested fully?

Mr. HOLADAY. Sir, we have manufacturing facilities back of both of these missiles. One of them is more extensive than the other one, but those manufacturing facilities are in and are producing missiles now.

Mr. WEISL. May I help you out a little bit?

When you and I talked, you said at that time you thought the cost was around a hundred million, the extra cost.

Senator JOHNSON. The Secretary of Defense testified that it would be substantial, but he did not give an exact figure.

Mr. HOLADAY. I am trying to stay away from the exact dollars, Mr. Counsel, not because I would not like to disclose it, but I do not believe that it—

Mr. WEISL. Do you think it is a matter of security not to disclose it?

Mr. HOLADAY. That is right.

Mr. WEISL. Very well, we will discuss it, then, in closed session.

I think that about completes my questioning, Mr. Chairman.

Are there any answers that you would like to give, or would you like to clarify any of my questions, or did you misunderstand any of

them? Have you any suggestions to make? Have you anything to add to what has been said?

Mr. HOLADAY. You have kept me so busy, Mr. Counsel, I haven't had much time to think on the side.

Mr. WEISL. I hope I haven't overburdened or taxed you too much.

Mr. HOLADAY. No.

Mr. WEISL. I just felt it a duty to get out all the facts.

Mr. HOLADAY. I am used to it. I have enjoyed it.

Senator JOHNSON. Mr. Holaday, we appreciate very much the time you have given us this morning and your candid approach to the questions that have been propounded.

The committee will take a recess until 2:30. If it is convenient for you to return at that time, the members would like to ask some questions in their own right.

Mr. HOLADAY. Yes, sir; I would be glad to.

Senator JOHNSON. Thank you very much, Mr. Holaday.

The committee will take a recess until 2:30 o'clock this afternoon.

(Whereupon, at 1:15 p. m., the subcommittee recessed, to reconvene at 2:30 p. m., of the same day.)

AFTERNOON SESSION, 2:30 P. M.

Present: Senators Johnson (chairman), Kefauver, Stennis, Symington, Saltonstall, and Flanders.

Senator Bush from the Committee on Armed Services.

Also present: Senator John A. Carroll (Colorado).

Senator JOHNSON. The committee will come to order.

The committee will continue until late in the afternoon, perhaps 6:30, 6 or 6:30, and have a brief recess for dinner and then have an evening session.

I hope we may be able to conclude our work for the day by 10 o'clock this evening.

The staff will notify the Secretary of the Army and the other witnesses of our plan in order that they may be available when called.

We plan to have a session all day tomorrow.

If necessary we will run late into the evening, and we will meet on Monday and Tuesday.

Our plans beyond that date have not been formulated.

As soon as we can see what progress we have made in these 4 days, I will consult members of the committee and make a public announcement as to when additional hearings will be held.

Mr. Holaday, we thank you for your testimony this morning. We hope you have had an opportunity to rest and relax some from the questioning, and I am sure if we can get the questioning underway before the members get back we can finish with you perhaps in a short time. [Laughter.]

Mr. HOLADAY. Thank you.

SUGGESTIONS FOR SPEEDING UP LONG RANGE MISSILES PROGRAMS

Senator JOHNSON. Mr. Holaday, you are familiar with the IRBM and the ICBM targets of achievement which have been presented to this committee.

Now would you tell us in 1, 2, 3, or 4 steps what you think can be done to bring those targets closer to achievement?

Mr. HOLADAY. Basically at the present time, these programs are in the hands, of course, of the engineers. I am now speaking of the Jupiter, Thor, and Atlas programs.

It is a case of the engineers taking the thousands of various parts and making them work as a unit, so that no one part falls down.

The best thing, and about the only thing we can do, of course, is, on the psychological side, to influence these engineers to understand the importance of their job and the necessity of carrying it out, they do have to have the support—they did have to have the money to carry forward.

My feeling is that we do have this money support. The encouragement and necessity of these things, I think, are being well expressed to these engineers.

So in the form of getting the IRBM's and the ICBM's, the first step we have to get through is the engineering to complete that part of the program so that we have developed a reliable missile for production.

The second part after this is the need for the industrial part of our community to come into operation. This is one thing the United States has been outstanding on.

So after we complete our development this may call for some very unusual manufacturing to carry forward the actual production of these parts. It is not only the missile, it will be the ground support equipment and the preparation——

Senator JOHNSON. Would you elaborate some on what you mean by unusual manufacturing?

Mr. HOLADAY. Well, the unusual manufacturing capacity which this country can always do under stress and strain. We do not have to work 8 hours, 5 days a week.

It is a case then of getting the trained personnel to come in and operate the machines to produce and manufacture these parts.

So I am stating, sir, that if we can get our development work completed then their selected load is the industrial load of manufacturing these parts.

While we are manufacturing the training has to progress.

While the training schools are being built some men are going through the phase of plant training now. These will become the instructors in the training classes.

It is well on its way. I would say we have to hope for a successful development and then to put forward the money to actually produce.

Senator JOHNSON. How would you summarize for me, 1, 2, 3, 4, what steps you think we can take that will step up achievement dates?

Mr. HOLADAY. Well, sir, one of the things, I guess we will have to come back to you for is a supplemental on more money in order to keep these programs going in the accelerated——

Senator JOHNSON. Money is No. 1, that is fine.

Now, No. 2.

Mr. HOLADAY. No. 2——

Senator JOHNSON. I will get into the details with you a little later but now come on, I want to get 1, 2, 3, 4, summarized.

Mr. HOLADAY. No. 2, of course, to this is we have accelerated several programs.

Senator JOHNSON. I don't care about the history now. You tell me about what you think we can do now to accelerate these target dates.

What you have done is well and good. I will give you a fine grade on that.

Now, will you tell me what you recommend we do now?

Mr. HOLADAY. We will have to be sure that there are no bottlenecks in the research and development program.

I do not know that there are any but this is the part we have definitely to follow up very quickly if any bottleneck does come along, we must have the ability to move money, men into removing these bottlenecks.

Senator JOHNSON. All right.

No. 2, would be removing bottlenecks of which you are unaware?

Mr. HOLADAY. That is right.

Senator JOHNSON. All right.

Now come on and give me some more recommendations.

I want you to impress this committee with what you think could be done to accelerate this program.

Give us your program, you are the head man now.

What do you think can be done, 1, 2, 3, 4, to get going on missiles?

REVIEW OF MANUFACTURING SUPPORT UNDERWAY

Mr. HOLADAY. Well, the third one would be to review and be sure that our manufacturing support to produce these things is capable of producing them at the rate we would like to produce them.

We are reviewing this at the present time to see that the manufacturing facilities back of these programs are adequate to produce not only the missile but the ground-support equipment.

The next item that we are working on and must be carefully looked into is the acquiring of land and the preparation of bases on which these can be deployed.

Senator JOHNSON. The last one, the manufacturing support you have already done a part of that, I assume in eliminating restrictive limitations. As Secretary McElroy indicated he found bottlenecks in working hours and so forth?

Mr. HOLADAY. That is right.

We are, however, surveying the balancing out of those manufacturing items. To be sure we have enough parts in all cases to give us maximum manufacturing capacity.

Senator JOHNSON. All right.

Now elaborate a little bit on No. 4, acquiring land. What would you do there to accelerate that and how would you accelerate the target dates by acquiring land?

Mr. HOLADAY. Well, if we accelerate, as we have, the Atlas program, we will have to accelerate the manufacture and construction work on the bases so that the bases are completed and ready to be used when the missile systems are completed.

Senator JOHNSON. Do you have any other thought?

Mr. HOLADAY. Well, of course in connection with the IRBM's, we will need considerable aid and cooperation from our allies on the making of bases available to us in Europe for the deployment of these missiles.

Senator JOHNSON. Yes.

Mr. HOLADAY. That is the IRBM.

Senator JOHNSON. Do you have reason to believe that you won't have that cooperation—that that cooperation won't be forthcoming?

Mr. HOLADAY. I think, sir, there is cooperation, but not dealing with it lightly, the progress sometimes is quite slow.

Senator JOHNSON. I assume that is a matter that is going to be gone into pretty thoroughly pretty shortly.

Mr. HOLADAY. Yes, I believe so.

RESULTS OF THE ATLAS ICBM PROGRAM TO DATE

Senator JOHNSON. I believe you said that you had ordered an acceleration of the Atlas program.

Mr. HOLADAY. Yes, sir.

Senator JOHNSON. Has the Atlas been tested?

Mr. HOLADAY. The Atlas has had two attempts, there has been no successful flight of an Atlas missile.

I may have to take some time, if I may, sir, to explain. When we talk about putting into production, the lead times on missiles is that time between the time we start the various components and the time we complete the missiles runs 18 to 24 months.

So if we are going to accelerate production, you see we have to start ordering the parts, we have to start training the personnel that are going to manufacture them, and put them together so if we say tomorrow we are going to increase the production we don't go from 1 to 2 missiles the next day.

It is over a period of months that we can accelerate our production.

Senator JOHNSON. But you had 2 tests and 2 failures.

Mr. HOLADAY. On Atlas we have had two failures. Two tests and two failures, correct, sir.

Senator JOHNSON. Two tests, two failures.

How long have you been working on the Atlas?

How long has the Atlas program been going on?

Mr. HOLADAY. In its present configuration, it started in 1954.

Senator JOHNSON. That is in its present configuration.

When was the first contract given to Convair in connection with the Atlas?

Mr. HOLADAY. 19——

Senator JOHNSON. Speak a little louder, I have difficulty—I am a little hard of hearing.

Mr. HOLADAY. 1946 or 1947, I believe.

We can get this record for you.

(The statement requested is as follows:)

The Department of Defense subsequently stated that Air Force project MX-774, the forerunner of the Atlas development was initiated in April 1946.

Senator JOHNSON. When did you make your two tests?

Mr. HOLADAY. The two tests were made this past summer.

Senator JOHNSON. That is near enough.

Now you say you are going to accelerate the Atlas program.

Just tell us precisely how this is being done.

Mr. HOLADAY. Well, precisely what is being done here is the ordering of long-lead-time items under the hope or gamble that the development program will be successful.

Senator JOHNSON. Does that involve spending more money?

Mr. HOLADAY. This will involve obligating more money.

We will have to obligate, place orders for long-lead-time items, such as guidance packages, nose cones, engines and things of this type which are parts that have 18 months or more lead-time requirements.

Senator JOHNSON. Does it involve letting any more contracts, hiring any more men?

Mr. HOLADAY. Over a period of time; yes, there will be more men employed.

Senator JOHNSON. How else do you accelerate a program, what else do you do besides additional contract authority, ordering items ahead of time, how many more men will be involved?

Additional men.

Mr. HOLADAY. Well, in the manufacturing this would probably more than double the number of employees on the production line.

Senator JOHNSON. How many are there now?

Mr. HOLADAY. On Atlas?

Senator JOHNSON. Right.

Mr. HOLADAY. I don't have those exact numbers at my fingertip.

Senator JOHNSON. Approximately how many?

Mr. HOLADAY. I am questioning in my own mind whether we should disclose the number of men.

Senator JOHNSON. Very well. We will go into that in executive session.

Now you are sure there is a production line?

Mr. HOLADAY. There is production, yes, sir.

The missiles that are being used in the research and development program are being made on industrial manufacturing facilities.

TARGET DATES IN EARLY ATLAS PROGRAMS

Senator JOHNSON. Was there under the old program a target date for perfecting the Atlas?

Mr. HOLADAY. On the revised——

Senator JOHNSON. Under the old program?

Mr. HOLADAY. Starting back in 1946.

Senator JOHNSON. Yes.

Mr. HOLADAY. This is before my date.

The General remembers something about this but not the details.

Could I ask Mr. Waggoner if he remembers any of the details?

Senator JOHNSON. Just answer me if you had a target date. I assume you did and the answer would be "Yes," and then tell me what it was.

Mr. WAGGONER. The answer is "Yes," but the target date that was given in estimates in the early 1950's was about 1965 for the availability.

Senator JOHNSON. Has that date been materially changed under your acceleration order?

Mr. WAGGONER. Yes, materially so.

Senator JOHNSON. How many laboratories and contractors are now working on the Atlas?

Mr. HOLADAY. Well, the——

Senator JOHNSON. In other words, how many people are going to get orders under your acceleration designation?

Mr. HOLADAY. You will have Convair which is building the missile primarily itself.

They will have several subcontractors on the ground-support equipment which will be accelerated.

The guidance system will cause an acceleration, the nose cone will cause an acceleration, and the engines to be used will have to be accelerated.

Senator JOHNSON. So everything connected with it will in effect be accelerated?

Mr. HOLADAY. Yes, sir.

Senator JOHNSON. When did you make that decision to accelerate?

Mr. HOLADAY. The decision was made on December 2.

I looked it up at noon, on December 2, the decision was made to progress with this thing.

As I said, there was a verbal understanding on it, the letter formalizing it went forward either yesterday or today.

Senator JOHNSON. So on December 2 you and the Secretary decided you were going to step up the Atlas and yesterday you finalized it or formalized it?

Mr. HOLADAY. Yes.

Senator JOHNSON. Does the budget for next year ask for more money for the ICBM program?

Mr. HOLADAY. Yes, we will ask for a supplementary in 1958 and an increased amount in 1959 for the Atlas program.

Senator JOHNSON. Has that decision been finalized?

Mr. HOLADAY. As far as the Defense Department, yes, we have.

Senator JOHNSON. When was that decision made?

Mr. HOLADAY. At the same time we approved going ahead with the program.

Senator JOHNSON. I am not asking for a dollar figure, but how much in relation to what is being spent now? Is it considerable? Is the increase next year substantial in comparison to what is now being spent?

Mr. HOLADAY. It is not a great deal more in 1958. It goes up substantially in 1959 and it will go up quite substantially in 1960.

Senator JOHNSON. Will you say twice as much next year as spending this year?

Mr. HOLADAY. On Atlas alone, no, not twice as much.

Senator JOHNSON. Would you care to give us some just general speculative figure there?

Mr. HOLADAY. Approximately one-third increase.

Senator JOHNSON. Approximately one-third.

IS RESPECT FOR THE RUSSIAN CAPABILITY BEING TRANSLATED INTO ACTION?

Mr. Holaday, we all know that we underestimated the Russians on the H-bomb, and we underestimated them on the A-bomb. Now, is it likely, in your opinion, that we are underestimating them on missiles?

Mr. HOLADAY. Well, that is a very difficult question to answer.

Senator JOHNSON. Well, in the light of what has happened to us, would you not think that is a distinct possibility?

Mr. HOLADAY. Yes, I would say that is a distinct possibility; yes, sir, I agree with you.

■ Senator JOHNSON. And you are aware of that possibility and I assume you are drumming it into the heads of everybody around you and making your calculations accordingly?

Mr. HOLADAY. Yes, sir.

Senator JOHNSON. I understand that an early decision has been recommended in connection with the Titan, putting it into production status, and I understand that it is felt that can be done at a relatively minimum cost. Now, I want to ask you if you have seen that recommendation? I don't want to get into one of Dr. Hagen's things where it gets lost and nobody finds it until after the Russians get one in the air.

Are you familiar, first, with the recommendation that the Titan be put into a production status and an early decision be made in connection with that?

Mr. HOLADAY. I have certainly held many discussions with the Air Force along this particular line, sir. I know that this is, and some of the recommendations that have been proposed to us for accelerating the Titan program. We have flown no test vehicles whatsoever in connection with the Titan program. It is under consideration and study—the advantages and possibilities of advancing the program.

I would not like to discuss it much further in an open meeting as to the pros and cons. There are some very good points on either side.

Senator JOHNSON. You are familiar with the recommendation?

Mr. HOLADAY. Yes, sir.

Senator JOHNSON. You are familiar with the fact that it is contended that it can be put into a production status in production quantities with a relatively minimum risk, and you do not care to tell us publicly whether you agree with that recommendation or not?

Mr. HOLADAY. Well, you put minimum risk in there, since we have not flown any of them at all. The magnitude of that risk is something you have to use considerable judgment on.

We do have the manufacturing plant. It is being built with the manufacturing line to support it.

Senator JOHNSON. That is what I want. I want your judgment. I know what the manufacturer says about it. I know the recommendation which has been made about it and I want to be sure it has been made and I want to get your judgment in connection with it. I am trying to put it as simply as I can.

Mr. HOLADAY. My feeling is, since we have done no testing, that we should not proceed with this.

I do believe that it is one of our most promising missile systems. Therefore, I have a very definite interest in it. And the second we feel like we are on the beam, I certainly would be for recommending proceeding with it.

Senator JOHNSON. Can you make any suggestion as to how we can get on the beam?

Mr. HOLADAY. Well, getting on the beam here, consists of doing this research and development and we have not lacked on either facilities or money to complete the research and development. We will have to depend upon the engineering ability of those engineers who are doing this work.

Senator JOHNSON. You are familiar with the recommendation, and you anticipate that a decision will be made, but you are not prepared to indicate what that decision would be in the light of the information you have at this time?

Mr. HOLADAY. That is right.

Senator JOHNSON. You stated earlier in your testimony this morning, Mr. Holaday, that you had a consultation with the Chiefs of Staff. Now, does that mean that they advised you? Was this the advice of the Chairman of the Joint Chiefs or was it a committee type of decision?

Mr. HOLADAY. My conversation was with the Chairman of the Joint Chiefs of Staff. We propose and get the recommendations of the Joint Chiefs of Staff on many problems. We propose our problem and send it to the Joint Chiefs of Staff for their study and recommendations.

We have several papers before them at the present time asking for their advice and recommendations.

Senator JOHNSON. So when you want a formal recommendation from the Joint Chiefs of Staff, you get it in written form? When you consult, you consult with the Chairman of the Joint Chiefs?

Mr. HOLADAY. That is right. I meet in several meetings where the Chairman is present.

AIR FORCE DEPARTMENT OF ASTRONAUTICS

Senator JOHNSON. Will the new Department of Astronautics in the Air Force be under your jurisdiction?

Mr. HOLADAY. No, sir.

Senator JOHNSON. Did they kind of jump the gun on you a little bit yesterday, or what is this I have been seeing in the paper this morning?

Mr. HOLADAY. I concur in your statement. I think they jumped the gun. The new Director for Space is supposed to have responsibility for this within the Department of Defense. Therefore, I concur in your statement that the Air Force jumped the gun.

Senator JOHNSON. But it is not under your jurisdiction?

Mr. HOLADAY. No, sir.

Senator JOHNSON. Under Mr. Quarles' jurisdiction, I gather?

Mr. HOLADAY. At the present time we, that is my office, works very closely with Mr. Quarles; we are doing all the necessary work in this area, so that there will be no dropoff while waiting for the new plan to come. Our office does a large portion of this. Mr. Quarles has been somewhat of a coordinator on it.

Senator JOHNSON. How do you account for what happened in their jumping the gun?

Mr. HOLADAY. I cannot account for it since I turned down a notice—

Senator JOHNSON. How would you justify it? Maybe that is a better way to put it.

Mr. HOLADAY. Well, the only expression I can use here is apparently the Air Force wishes to show their ability in this and maybe see if they can grab the limelight and establish a position here before this new Director is set up in the Department of Defense. I cannot tell exactly what they are trying to do. Although you can look at it from this point of view. It is purely one of concentrating in this one area that work which they were doing now and that portion of the work which would be assigned to them under the new Director.

Senator SYMINGTON. Mr. Chairman, will the Chair yield? I was not quite sure I heard that. Could the reporter read back the answer. I want to be sure I heard him correctly.

Senator JOHNSON. Mr. Reporter, will you read back the last answer.

Senator SYMINGTON. The question that the Chair asked and the reply of the witness.

Senator JOHNSON. Mr. Reporter, will you please read that back?

Senator SYMINGTON. Thank you, Mr. Director.

Senator JOHNSON. You said you turned it down. I understood you to say a moment ago that you turned down something in connection with this. What did you turn down? Just tell the committee.

Mr. HOLADAY. There was only a release which comes to us and goes through our office in connection with releases of information. What I turned down was a proposed press release by the Air Force. I did this jointly with Mr. Quarles.

Senator JOHNSON. You turned down the release?

Mr. HOLADAY. Yes, they released—

Senator JOHNSON. But they just released it anyway?

Mr. HOLADAY. Well, I have not seen exactly what they did release. All I was dealing with here was a proposed newspaper release.

Senator JOHNSON. Is the Air Force superior to the Director for Guided Missiles and the Deputy Secretary of Defense, the Secretary of Defense? Do they proceed independently? You all say no announcement can be made and they jump the gun? By what authority did they override the decisions of you and Secretary Quarles and Secretary McElroy, if they have any authority to do so?

Mr. HOLADAY. I am not conscious that they did make a release.

Senator JOHNSON. I thought you said they jumped the gun.

Mr. HOLADAY. No; I said I concurred with you that they probably jumped the gun. I do not know that they have put out a release. I have not seen a release of the Air Force.

Senator JOHNSON. How did they jump the gun then?

Mr. HOLADAY. Sir?

Senator JOHNSON. In your view, how did they jump the gun?

Mr. HOLADAY. If what they have out in the newspapers is correct, something must have been either released or leaked to the newspapers, I am not sure. I haven't read it.

Senator JOHNSON. I agree with you. That is what you mean by saying they jumped the gun, by giving it to the newspapers when all of you had turned it down; that is what you mean?

Mr. HOLADAY. Yes.

SIX POINTS FOR ACCELERATION OF PROGRAM

Senator JOHNSON. Now, in the study which the committee staff made, wherein the committee has sought information from every conceivable source that we can think of, a brief summary was made this morning of the best advice available to us. In effect it finds that in six respects we could accelerate this program.

I might add to you, any man's judgment on any given question is no better than the information he has, and I think the information of all these people working on this program—first, the scientists we have had here, and the manufacturers and the contractors and the workers, the various scientific groups like Bell Laboratories, and so forth—I

think that the information they give us will help us to eventually make a sound judgment on the question.

We have our judgments to make, and we will make them in committee report and recommendations.

You have your judgments to make, and some you have to make today. I hope you will make judgments as I go over them with you.

Now, the first comment that they made was that the United States urgently needs to bring its missile-satellite-space program under an independent civilian commission. That is No. 1.

Do you agree?

Mr. HOLADAY. No, sir. At the present time, it would radically upset the program in all areas. I do not concur with that.

Senator JOHNSON. All right. But you would agree with modifications, I assume?

Mr. HOLADAY. To modifications of that; yes.

Senator JOHNSON. In what respect?

Mr. HOLADAY. One of them is the setting up in the Defense Department of this space and research work in the space and satellite field. I concur that this is the time. This is a new program and this is the area—

Senator JOHNSON. So your basic difference with that would be, you would make it dependent upon Defense instead of an independent civilian commission, independent of Defense; that is the basic difference?

Mr. HOLADAY. Yes, sir. And this is based partly on the fact that you cannot do development work in this area without being related to and with the military people in all this. It is quite a problem, and I concur we are better off where all these factors can have their effect.

Senator JOHNSON. You wouldn't go so far, under that theory, as to bring the Atomic Energy Commission over under Defense; would you?

Mr. HOLADAY. Not at this time; no, sir.

Senator JOHNSON. But would that not necessarily follow under your theory? They make some pretty important things over there.

Mr. HOLADAY. We have a military applications group that works very closely with the Atomic Energy Commission.

Senator JOHNSON. I am not barring you from having one to work very closely with this other independent commission. You could have one working very closely with them.

But I gather you think it undesirable.

Mr. HOLADAY. Yes, sir.

Senator JOHNSON. If it would be undesirable, why would it not be undesirable with Atomic Energy, as well, under your theory?

Mr. HOLADAY. Well, the Atomic Energy works only on one particular phase, as far as missiles are concerned, and that is the warhead.

Senator JOHNSON. That is right. That is not very important, either, is it?

Mr. HOLADAY. Yes, sir.

Senator JOHNSON. All right.

Mr. HOLADAY. Yes, it is very important.

A missile program is dealing with an entire missile system which has to be coordinated and worked into a military unit which is going to deploy it.

Senator JOHNSON. Then it is your testimony and your opinion that the Atomic Energy Commission can take care of the warheads all right as an independent civilian agency, but it would be disastrous to have an independent civilian agency attempt to handle the missile, satellite, and space program because you have got more parts to them? Is that a fair statement of your view?

Mr. HOLADAY. As of this time, yes, sir.

Senator JOHNSON. I do not want to belabor that point. I do not necessarily agree with you, but I want to see if I can finalize your conclusion on this recommendation, recommendation No. 1.

Is it fair to say you believe the United States urgently needs to bring its missile, satellite, and space program under one jurisdiction, under one head?

Mr. HOLADAY. In due course of time, that may be desirable. We are certainly moving in that direction now in setting up the space area. But if you attempted to move on all missiles at this time, that would cause considerable confusion and interruption.

It certainly is in a direction that we are planning to move, and I think we are moving in that direction.

Senator JOHNSON. Would your answer be any different if the commission was limited to space and satellites alone?

Mr. HOLADAY. If the new commission stayed only on space and satellites?

Senator JOHNSON. Yes.

Mr. HOLADAY. Well, it starts out, sir, on the space and satellite areas.

Senator JOHNSON. I say if we had an independent civilian commission that were limited only to space and satellites, and not missiles, would your answer be any different from the one you previously gave?

Mr. HOLADAY. No, sir.

Senator JOHNSON. So, then we can say that you believe we do need to bring our missile, satellite, and space program under one directing head with centralized authority?

Mr. HOLADAY. Yes, sir.

Senator JOHNSON. All right.

The only place you differ, then, is whether or not it is under the Defense Department or whether it is under an independent civilian agency?

Mr. HOLADAY. Yes, sir.

Senator JOHNSON. All right.

THE GAITHER REPORT

Now, when did you first read the Gaither report?

Mr. HOLADAY. I don't remember the exact date, but as I recall, it was some 3 or 4 days after it was presented to the President and the National Security Council.

Senator JOHNSON. Was it a somewhat voluminous report?

Mr. HOLADAY. No.

Senator JOHNSON. Did you read the report in its entirety yourself, or have it briefed for you?

Mr. HOLADAY. No, sir; I read it entirely.

Senator JOHNSON. How long is the report?

Mr. HOLADAY. I would estimate that it is in the neighborhood of a quarter of an inch thick.

Senator JOHNSON. How long did it take you to read it?

Mr. HOLADAY. I believe that my estimated time in reading and re-reading was in the neighborhood of 3 hours.

Senator JOHNSON. Were you startled by some of its conclusions?

Mr. HOLADAY. I don't believe so, since a number of my associates in the Pentagon had been working along with this group. I was fairly up to date as to the type of information and recommendations that was going to be made in the report.

Senator JOHNSON. Did you generally go along with those?

Mr. HOLADAY. Yes, sir, I think the recommendations are very sound and very good.

Senator JOHNSON. So you would embrace the recommendations in the report?

Mr. HOLADAY. Yes, sir. I don't know whether I can go as fast as some of them recommend we go, but in principle I concur in them.

Senator JOHNSON. It is a rather comprehensive report, well done, in your opinion?

Mr. HOLADAY. Yes, sir.

Senator SYMINGTON. Would the Chair yield for just one question there, for clarification?

Senator JOHNSON. Surely, Senator Symington.

Senator SYMINGTON. When you say "fast," do you mean fast in money or fast in effort?

Mr. HOLADAY. I would say fast in money and our ability to maybe move as fast as they indicate they think we should move in getting things accomplished.

This is a field here in which they think certain things can be done in a time period. In my own mind, I am doubtful whether we can do them quite that quick, sir.

Senator SYMINGTON. Thank you, Mr. Chairman.

Senator JOHNSON. Would the implementation contained in the Gaither report involve substantially increased expenditures on the part of the Congress?

Mr. HOLADAY. Yes, sir.

Senator JOHNSON. Would you be willing to indicate to us in what respects?

Mr. HOLADAY. Well, part of the recommendations that are within the Gaither report are being carried out by some of our accelerations in programs, and I don't know whether that is the answer to your question or whether I misunderstood your question.

Senator JOHNSON. I asked what subjects are covered by the Gaither report. I will put it this way and try to get at it from another angle.

You misunderstood it.

Mr. HOLADAY. I have talked in general terms about what was in the Gaither report, and apparently your question seems to be specific as to what is in the Gaither report.

Senator JOHNSON. What particular fields are covered by (a) and (b), in what particular fields are substantially increased appropriations needed?

Mr. HOLADAY. Sir, if I attempt to answer that question, we will have to go into closed session.

Senator JOHNSON. If the lawyer does not desire you to answer it, I will not press it. We will be glad to go into executive session. We were doing very well.

Mr. HOLADAY. I am trying to help as best I can.

Senator JOHNSON. I understand you are, and I appreciate it, and I compliment you.

Mr. HOLADAY. Thank you.

Senator JOHNSON. I want to yield to my lawyer here. [Laughter.]

All of us, I guess, could not live without lawyers, and this committee would be in bad shape if we did not have one, and I can understand the desire of counsel not to breach security. But I think you can be trusted pretty well in that respect.

Will you answer the question in executive session?

You can ask your lawyer if you want to.

Mr. HOLADAY. Well, I had better ask him. He came right up here and patted me on the head.

Senator JOHNSON. Give us the name of the lawyer.

Mr. DECHERT. My name, sir, is Robert Dechert. I am General Counsel to the Department of Defense.

In answer to your question, sir, we had to say that we did not have a copy of the report.

Senator JOHNSON. I would like to have Mr. Holaday answer it.

Mr. DECHERT. I thought you were asking me.

Senator JOHNSON. You can advise him. I understood him to say he wants advice from you.

Mr. HOLADAY. My counsel advises me this is the report to the President, and the President will have to release it.

Senator JOHNSON. I am not asking you to release it. But I am just asking you to give us your reaction to some of the things in it that you had done, and particularly the accelerated costs that would be required to implement it, and——

Mr. HOLADAY. In general terms, I am trying to be as helpful as possible——

Senator JOHNSON. I appreciate that.

Mr. HOLADAY (continuing). I think in executive session, in dealing with their recommendations in the guided missile area, if we didn't discuss specifically the details of it, I could more freely talk with you about what we have done in implementing it.

Senator JOHNSON. I think that is a fair and reasonable position to take, and I compliment you for it. If you will not spend too much time talking to lawyers, and talk to the committee, we will both profit from it.

We will go into executive session. I got the impression that everybody except the chairman and the committee knows what is in it. I cannot go outside the room without somebody telling me part of it. And since we are going to be concerned with it, I would like to have the top man in the missile field's general evaluation, and kind of tell me the specific areas covered.

I would like to have reliable information instead of all the hearsay and the stuff that is dropped under the rug.

Mr. HOLADAY. I concur with you 100 percent on that.

Senator JOHNSON. If you just will not change your opinion before we get into executive session, we will hear it.

The second recommendation that was made, and I want to get your views on this because I think you are striving to do everything

you can to help your country in this critical period, the second recommendation is: There is need for a permanent, competent and adequate staff in the Defense Department to provide leadership in basic and applied research.

RECOMMENDATION FOR STAFF TO SUPERVISE RESEARCH

Do you think the Defense Department does have need for a competent and adequate staff to provide leadership in basic and applied research?

Mr. HOLADAY. Well, this, of course, criticizes what we have at the present time in the research and development area, the Assistant Secretaries for Research and Development in the individual services. I think they have been doing quite a good job.

Senator JOHNSON. I am not asking you to criticize or justify them. I am asking you if there is need for a permanent, for a competent, for an adequate staff in the Department to provide leadership in applied and basic research. I would assume you would say "yes" or "no," "Yes, there is a need for it" or "No, there isn't."

Do you think it is adequate now, do you think it is competent now, do you think it is permanent now, and do you have all that is to be desired? I would gather you would then want to say, "No, I don't think there is any need for it. I think we have got the best in the world. We have got all we need. We are doing a good job," and so forth.

If you do not, I think you would need to say, "Yes."

The key word I want to point out to you is the adequacy of it. This whole Nation is up in arms wanting us to get on with missiles. Every place you go, every person you talk to, they are hungry for information, they are concerned that we are not doing all we can as fast as we can.

Now then, do you, as one of the top authorities in this field—I want to ask you if, in your opinion, you think your present staff is adequate?

Mr. HOLADAY. Well, of course I have to have considerable aid and assistance in all of this area, and to carry on and forward a research program, it makes it very difficult for me to answer you "yes" or "no."

Certainly we could stand some improvement or have more competent people added to us to help carry the program forward.

Senator JOHNSON. Do you think there is a need for that?

Mr. HOLADAY. Yes, sir.

Senator JOHNSON. That is the way I wanted you to answer, and I am glad you agree. I think there is need for it, and I think the results show a need for it, and I think the consensus is we have a need for it. And I am glad you agree we have a need for it, because I think you in your position can do more toward satisfying that need and supplying it than anyone else, with your recommendation and your requests.

I assure you as far as this one member of this committee is concerned, I am going to give you all the help you need to see you get not only a competent one, not only a permanent one, but, I emphasize, an adequate one, because we may not have a second chance.

Now, the third recommendation made is: The research and development program should be on a 3-to-5-year basis instead of an annual basis, so you can plan accordingly.

What is your comment on that? Do you agree?

Mr. HOLADAY. I think I very definitely have to agree with this, because research cannot be turned on and off. You can turn it off, but it is very hard to turn it on.

Senator JOHNSON. What I am pleased about is, here we have been going for 2 weeks, and I have talked to some of these people, and I have heard some of these reports, but I have been going from one part of the country to another; but here is a staff which has talked to roughly a hundred leaders in this field, and their recommendations sum up to 1, 2, 3, 4, 5. Now we are through with 3 of them, and you have had a modification of 1, but here you are in charge of this program, and you agree with what the general consensus of the top people in this country happens to be.

I want to take the fourth one: Contractors should have more leeway to make technical decisions, too much redtape, too much strait-jacketing—I guess by a Government supervising officer or supervising agents.

What is your opinion of that? Do you think it would be desirable for contractors to have more leeway in making technical decisions in this field?

Mr. HOLADAY. In certain areas, they have considerable freedom. In certain areas, I think they have not had their freedom.

There is certainly merit to that suggestion where people have not been able to move ahead with their own ideas and thoughts.

Senator JOHNSON. So you think that there is merit to the suggestion that contractors should have more leeway to make technical decisions because you are aware of certain areas where that leeway is necessary?

Mr. HOLADAY. That is true.

Senator JOHNSON. All right.

Let us take No. 5: Reduce the lead time by making early and firm decisions.

Mr. HOLADAY. Well—

Senator JOHNSON. Reduce the lead time by making early and firm decisions. I am not asking you to criticize somebody who preceded you or to compliment somebody who succeeds you. I am just asking you if you do not think it is highly desirable, in a program of this kind, that we make early decisions and they be firm so we know where we are going from here?

Mr. HOLADAY. This, being an industry man and looking at the program from where I sit, I would say, yes, this is true.

Senator JOHNSON. The answer is "Yes."

No. 6: Eliminate overtime restrictions.

I gather that has been done generally across the board wherever you found any need existed.

Mr. HOLADAY. That is right.

Senator JOHNSON. And you felt that at the time we met last time, December, that you did have to make that decision; it was a principal bottleneck, and the Secretary faced up to it and made it.

Mr. HOLADAY. That is right.

Senator JOHNSON. And you are getting satisfactory results?

Mr. HOLADAY. Yes, sir.

Senator JOHNSON. So you would agree, then, in effect, on all six of these recommendations, with the minor modification that you would not buy this new commission right now?

Mr. HOLADAY. Yes.

Senator JOHNSON. You might do it in a few months after you had tried one out?

Mr. HOLADAY. Yes, sir; I think that is true. Yes, sir.

SIX RECOMMENDATIONS WERE CONSENSUS

Senator BUSH. Mr. Chairman, will you yield for a question to the chairman?

Senator JOHNSON. Yes, sir; I yield.

Senator BUSH. Were these five points developed by the staff of this committee? Are we to understand that?

Senator JOHNSON. No.

Senator BUSH. Who developed those five points?

Senator JOHNSON. The staff talked to some hundred——

Senator BUSH. This is a consensus?

Senator JOHNSON. And from those groups, this morning they read a series of letters in which the Bell Laboratories made recommendations, the Naval Research group made recommendations, the General Dynamics and different ones made recommendations, and we summarized those recommendations.

It seems to be pretty general all through it, all of them were saying these things.

Here is the top man. I wanted to get his impressions. And the interesting thing to me and the satisfying thing, and I hope the satisfactory thing is that here the boss in Washington agrees with these people in the field that here is where improvement needs to be made. I hope that Mr. Holaday will give us his usual fine cooperation and take these suggestions and study them, and look for places where he can put them into effect wherever he thinks it is feasible and desirable and economical to do so.

And I am sure that is what he will do.

Mr. HOLADAY. Yes, sir.

Senator JOHNSON. Does that answer your question, Senator Bush?

Senator BUSH. Yes. Thank you, Mr. Chairman. I just want to make sure I understand it. This is a summary or a consensus?

Senator JOHNSON. That is correct.

Senator BUSH. Formed by our staff, of what they got out of these hundred inquiries?

Senator JOHNSON. Yes. I would say that you could probably take the hundred people they interviewed, and a hundred letters that were written confirming it, and could get 181½ recommendations; but 6 of them, practically all of them said.

And I summarized those six, and I wanted to ask his opinion of them. I could go into a great many others which will be submitted to him, because the letters are going to be submitted to him. We will probably put them in a report if we have a report. But right now, these are the six that stand out.

Senator BUSH. I thank the chairman for that information.

Senator JOHNSON. Mr. Holaday, since the Secretary had issued his order rescinding the restrictions on overtime in the ballistic missile program only 4 days prior to his testimony, did not fairness and the interests of full disclosure require all these facts be disclosed to the members of this committee, so they might not continue to labor under the impression there were no earlier restrictions on the use of overtime?

NO RESTRICTIONS ON R. AND D. TESTING PHASE

Mr. HOLADAY. The dates on taking off the restrictions on overtime are not all at one time. The letters which went forward at the time the overtime restrictions were put on, as I pointed out this morning, had a paragraph stating, if these restrictions slow up your development program or operational capability, you are to call it to our attention.

These were called to our attention at different times, so that the restrictions on various programs have gone off at different times.

I do want to point out again that we had no restriction on the research and development testing phase, which was the critical part and still is the critical part of our program.

Senator JOHNSON. But it did have on your production, or could have, an effect on it?

Mr. HOLADAY. Yes.

Senator JOHNSON. And production is an important part of your whole general picture at the moment, is it not?

Mr. HOLADAY. It will become more important when we finish up our development work.

Senator JOHNSON. It is important enough so that the Secretary thinks it is the greatest single bottleneck he has found.

Mr. HOLADAY. Yes, sir.

Senator JOHNSON. But it has been eliminated; is that correct?

Mr. HOLADAY. Yes, sir.

Senator JOHNSON. Would you please furnish for the record a copy of every decision, every directive, every order issued by the Department of Defense or by any of the military services during the calendar year 1957, affecting the use of overtime in the ballistic-missile program?

Mr. HOLADAY. I believe we have furnished that information.

Senator JOHNSON. Will you please check and see that that is in the record?

Mr. HOLADAY. Yes, sir.

(The information requested of Mr. Holaday is included in the classified records of the subcommittee.)

Senator JOHNSON. Do you have any recommendations before I conclude my examination that you would like to make to this committee as to how we can contribute constructively to expediting the missile program?

Mr. HOLADAY. I think we have covered most of the recommendations. I would again like to refer to those that Secretary McElroy used during the time that he was before the committee, and the fact that we have carried out quite a good many of those at the present time.

Senator JOHNSON. Do you agree with all those he made?

Mr. HOLADAY. Yes, sir. I have a copy —

Senator JOHNSON. I wonder if you would do this then. So I will not take too much of your time, and I apologize to my colleagues for taking so much. Would you supply for the record, in addition to what I have already asked, every order, every directive, a copy of every decision that you have made since our briefing at the Pentagon following the Sputnik II on Tuesday, tending to accelerate the program?

Mr. HOLADAY. Yes, sir. Nearly all of these will be classified.

(The information requested of Mr. Holaday is included in the classified records of the subcommittee.)

Senator JOHNSON. Yes. I do not know about that. I pick up the morning paper every morning and I see some statement about the Air Force. This morning it said they were doing something, and Mr. Quarles was kind of dragging his feet a little bit on it. But there is something every morning. They have got a good press outfit over there. If you will just get together all those decisions, I think that it would be of value to this committee and to the American people to show what action has taken place since Sputnik No. 2. If you will supply those for the record, I would appreciate it.

Mr. HOLADAY. I would just like to comment this one way. When I said some of them would be classified, they do have details on production rates and things of this type.

Senator JOHNSON. Sure. Anything that is classified, you can so indicate. I want as much of it in the record as I can because I think the country and the committee ought to know how you responded to this challenge of the dog up there going around 18,000 miles an hour, if we are doing anything about it and what we are doing. I think it would be good just to put in the chronological calendar in the record.

Mr. HOLADAY. I would be very glad to.

Senator JOHNSON. I want to thank you very much for your patience and your understanding of our problems, and I want to ask you this one final thing.

If you have a workweek that has limitations placed on it so far as your technicians are concerned, your scientists are concerned, all those seeking the answers are concerned—your engineers as I believe you put it a little while ago, if they are limited in their workweek to the point where they cannot get the answer—then those who must produce after we get the answer, their workweek is in effect limited to zero, is it not? It is a zero-hour workweek, is it not, because until you get the answer you cannot go ahead with the production?

Mr. HOLADAY. That is right.

Senator JOHNSON. So it is extremely important that with the limited number of men we have and the limited technicians we have and the limited scientists we have—although we think they are of the highest quality and I certainly do not want to underrate them and I think they have been kicked around too much and I think they are a dedicated group—it is extremely important that we provide every resource that they can adequately and economically and efficiently utilize, is it not?

Mr. HOLADAY. Yes, sir.

Senator JOHNSON. Because we have got to answer on production. If we find what we want to produce, and the answer to what we are going to produce, you have not the slightest doubt but what we can make them so fast they will be running out of our ears.

Mr. HOLADAY. That is right.

Senator JOHNSON. Thank you.

Senator SALTONSTALL. I want to thank you for your testimony and I appreciate your responses.

Senator JOHNSON. Senator Saltonstall.

Senator SALTONSTALL. Thank you, Mr. Chairman.

THE "SPACE GROUP"

Mr. Holaday, may I ask you just a few questions along three separate lines. You have been questioned by Senator Johnson on this space problem and is it my understanding that there is to be a separate group or separate committee set up to operate this space group as opposed to your group in the ballistic missiles?

Mr. HOLADAY. Yes, sir; it will be equivalent to a Director for Space, a spatial agency, and they will be assisted by having the money appropriated to them and they will carry on the research and development right in that group. It will be separate from our operation where the research and development and production is in the services, if I can draw that distinction.

Senator SALTONSTALL. Then you draw the distinction that the space group, the space problem is a problem that is not strictly a military problem?

Mr. HOLADAY. Of course, there are quite a good many very definite military problems, and there are, of course, the scientific parts of it. I do not think in any military problem that science is not of value to us. It very definitely is of value.

Senator SALTONSTALL. What I was getting at was this: As I understand it, the power to thrust the satellite up into the air is part of the problem that you have to thrust the ballistic missile up in the air; is it not?

Mr. HOLADAY. Yes, sir.

Senator SALTONSTALL. And I just wondered if you were not going to have a conflict between your two groups and perhaps misunderstandings, leading to competition and thus waste; that would be inadvisable?

Mr. HOLADAY. Well, I hope that is not the case. At least our planning, and our thinking is all on a coordinated and cooperative basis.

Certainly, if this group took off and developed its own engines and everything of this kind, it would be wasteful. The planning and thinking so far as I am concerned, and also Secretary McElroy, is that we will be a cooperative group, not fighting and will use the available material we have to help out in their program.

Senator SALTONSTALL. Now, is that a decision that has already been reached?

Mr. HOLADAY. Secretary McElroy announced that thing and said it would be operational as soon as a man was available to head it up.

Senator SALTONSTALL. Do you think it is going to accelerate the space problem research as well as the ballistic problem research to have them divided this way in two sections?

Mr. HOLADAY. Well, sir, I have to concur in this since I assisted in making the recommendation to the Secretary, I have to concur this is a very definite straightforward group.

WHY NOT CUT DOWN ON THE COMMITTEES?

Senator SALTONSTALL. Now, I listened with a great deal of interest this morning to the number of committees that you and Mr. Waggoner described. Why should not some of those committees be abolished? Are there not too many committees there now? If you are going to be the director of all this ballistic and guided missile research

and development, why should not you cut down on the number of committees?

Mr. HOLADAY. Well, sir, maybe I can try to defend each one of them. My advisory group on ballistic missiles, I need very definitely to keep me advised. It also acts as you well realize to overcome considerably this shortcoming in the exchange of information which was raised by certain of the companies. Understand that certain people serving on this Committee, come from industry. This helps to keep them advised as to what is going on and we get the best and broadest recommendation.

In the one on Vanguard, it is possible that this Committee will be eliminated, or in all probability modified after we finish the Vanguard problem. They will become advisory to the new Director of Space, so after we complete our Vanguard portion of the program, and the Space Section is set up, we would not have any further need for it.

Now, as to the Ballistic Missile Committee, as I pointed out, this is wrongly named; it is an action group rather than a committee. It has members within the Department of Defense to give quick action to decisions.

Now, one other group, I believe that was discussed this morning was the Coordinating Committee on Guided Missiles. That was in Research and Engineering; and since this activity has been moved to our office, in all probability this will be eliminated.

The Thor-Jupiter committee in all probability will also be eliminated if we continue as we are now going at the present time.

The panel on aeronautics is only indirectly advisory to us, they are in Research and Engineering and not in our office. We sit in on their meetings and take whatever advice they give to us.

The anti-ICBM committee has been doing excellent work up to the present time in coordinating information and pointing up the need for research and development that we need, and they also in turn may become part of the new office.

Does that help you, sir?

Senator SALTONSTALL. So with the present committees, 2 of them will be abolished and 2 others will be transferred to this new space group?

Mr. HOLADAY. That is right.

Senator SALTONSTALL. And you feel that all the others are advisable because it keeps industry informed of what you are doing and also permits you to work with industry better?

Mr. HOLADAY. Yes, sir. We have, of course, always had a very strong support from industry on our advisory committees as one of the very excellent means of communication and exchange of information.

RELATIONSHIP WITH DR. KILLIAN

Senator SALTONSTALL. As yet, you have not described entirely your relations with Dr. Killian, not on the ground of personal relations because I know they are cordial, and I know that they are cooperative. But assume that there were different personalities involved. Is there in your opinion a clear-cut line of authority between Killian and yourself?

Mr. HOLADAY. I do not believe, sir, that I have any difficulty in understanding this. He is of aid and assistance to us in expressing

his own personal views, the results from his own advisory committee, and in reverse, making it possible for us to get to the President, through him, our recommendations and considerations.

I see no difficulty here whatsoever.

Senator SALTONSTALL. Well, if he and you, if Dr. Killian reached one conclusion and you reached another conclusion, that problem would have to go to the President.

Mr. HOLADAY. I imagine it would, yes, certainly, because Dr. Killian works for the President. I think the President would have to resolve it.

Senator SALTONSTALL. In other words, then, neither Dr. Killian nor you are superior one to the other in the line of authority?

Mr. HOLADAY. No. I never considered it that way. I have considered him more on a par with me, being in the President's Office, however, instead of in the line of command.

Senator SALTONSTALL. And he could not overrule any of your decisions, certainly, without the authority of the President?

Mr. HOLADAY. I believe that is my understanding, sir.

Senator SALTONSTALL. Another point was not entirely clear to me this morning, perhaps because I have been on the Appropriations Committee a number of years. When you used this word "available" to the counsel, available funds, it was not quite clear to me that what you said agreed with my understanding of the statutes and the budgetary authority.

Let me put it this way: It is my understanding that when Congress makes an appropriation, we will say, of a million dollars for research, that goes to the Budget Director. That does not become available to the Department of Defense or to the Air Force, the Army, the Navy, until the Budget Director releases it to the Comptroller of the Department of Defense. The Comptroller of the Department of Defense takes that money and he determines when it shall be released to the three services or to the Department of Defense—or to the research efforts, we will say, of the Defense Department.

Now, when it becomes available to the research of the Defense Department or of the services, then it can be used and contracted for. Now, do you agree with that understanding?

Mr. HOLADAY. Yes, you are the expert in this and that is my understanding of the way it works, yes, sir.

Senator SALTONSTALL. So that when you say that you have control of all the available funds, you mean the funds that have gone through those processes and have reached your desk or reached the desk of the various services?

Mr. HOLADAY. That was what I was working on; once the money becomes available to us, we freeze it for our programs.

Senator SALTONSTALL. Now, do you, as Director of Guided Missiles, have the power to allocate the funds to the various services to particular missile projects?

Mr. HOLADAY. I will have to apologize to you, Senator Saltonstall, I was trying to read and listen and unfortunately I cannot do both. Will you ask your question over again? I am sorry.

Senator SALTONSTALL. Do you, as Director of Guided Missiles, have the power to allocate the funds of the various services to particular missile projects?

In other words, as overall Director with the authority that Mr. McElroy has given you, can you say to the Air Force or to the Navy,

"You shall use funds allocated to the Air Force or to the Navy for specific missile projects."

Mr. HOLADAY. If I understand you, we approve that expenditure of money or disapprove that expenditure of money.

I am afraid I am not following you because you are too much of an expert in this money area, sir, I am sorry I can't follow you completely, sir.

CAN DIRECT INITIATION OR CANCELLATION OF PROJECTS

Senator SALTONSTALL. Let me put the question in another way.

Can you direct the Secretary of the services to either initiate or cancel a particular missile project?

Mr. HOLADAY. This is my understanding of my authority. I certainly would not do this without lots of counsel with the Secretary and so on. But when the time comes to cancel or approve or to expand, I have to assume this responsibility and do it; yes, sir.

Senator SALTONSTALL. So that when we, as the Members of Congress, appropriate a billion dollars, we will say specifically to the Department of the Air Force (for research), you can direct where that money shall be spent.

Mr. HOLADAY. Yes, sir.

Senator SALTONSTALL. Is it possible for the services to act independently of your office either as to the initiation of a new missile project or the amount of financial support which a service might wish to commit to an existing missile project?

In other words, can they act independently of you or under your directive now, do you assume all responsibility for determining what they shall initiate, what they shall reject and what they cannot go outside of?

Mr. HOLADAY. Well, sir, this has been the method in the ballistic missile area in which we have worked.

This is the method which we plan to work on all missiles in the future. That is how the program will be approved, and how the amount of money to go with it will be approved. And once approved, they therefore proceed down their program.

Only in case they try to make any modifications or changes they must come in for an approval or modification of their program.

Senator SALTONSTALL. Has the Secretary of Defense given you responsibility over his discretionary fund insofar as it applies to missile projects?

Mr. HOLADAY. You are talking about his emergency money?

Senator SALTONSTALL. Yes. He has \$80 million if my memory is correct with a \$50 million additional transfer authority.

Mr. HOLADAY. No, I would have to make a recommendation to him, sir, for the use of that money.

And incidentally, I have made some recommendations and used some money.

Senator SALTONSTALL. The directive by Mr. McElroy, which he has given to you, and which you read this morning, has increased, in your opinion, your authority over what it was as the Assistant to the Secretary of Defense for Guided Missiles.

In other words, you have got more authority since that directive than you had before.

Mr. HOLADAY. Yes, sir.

ANTIMISSILE MISSILE, SATELLITES AND SPACE VEHICLES NOT UNDER HIS JURISDICTION

Senator SALTONSTALL. Will you have authority over the antimissile missile program, satellites and space vehicles or will these come under the jurisdiction of the proposed Advanced Research Projects Agency?

Mr. HOLADAY. They will come under the other Agency and will not be under my supervision.

Senator SALTONSTALL. So the other Agency will have the space program and the others.

Mr. HOLADAY. The satellites, space platform, and antimissile missiles.

Senator SALTONSTALL. Was there another program there?

Mr. HOLADAY. No. I think we must keep it clear, sir, that the research and development part of the antimissile program will be over in the other Agency.

Once we decide that we are proceeding with a weapons system, this will then be assigned back to a military service and will come back into our office. When the service really gets down to the building of hardware and in the building of the equipment to make an antimissile missile system, this will come back into our office.

The research and development is in the new area.

Senator SALTONSTALL. Mr. Holaday, if I might make a comment, this is not a question, but it is a comment—as one Member of Congress, I would hope that you and Mr. McElroy would look very carefully into the development of this new agency because it seem to me that in creating new agencies in this field, speaking as a laymans, that you are going to run into some more conflicts and perhaps some more contrary decisions that will lead to slower action.

That is a comment, not a question to you.

Now I may be wrong in that.

Would you have any comment on that?

Mr. HOLADAY. No; I don't believe so—we are still studying the new organization and its methods of operation.

We have almost daily conversation on this subject, and we will very definitely keep in mind your point, as we have in the past, about whether that should be separated from our office.

These have all been parts of our discussions, sir, and we are still flexible in the final decision as to how and what will be in this unit and exactly how it will operate.

We are taking the best counsel and advice we can get at this time in getting the organization put together so it can be efficient.

Senator STENNIS. Excuse me. Just a moment.

The Chair is in doubt as to what has become of the 10-minute rule. The Chair would like to advise with the committee as to what the pleasure of the committee is.

The chairman took some extra time. I am not inclined to try to enforce the rule abruptly but I think in deference to those further down the list something ought to be done about it. What is the pleasure of the committee, and what is the pleasure of the Senator from Massachusetts first?

Senator SALTONSTALL. Mr. Chairman, as your comment was obviously aimed at the Senator from Massachusetts, I would say I was following along the lines of the chairman.

I have three more very simple, brief questions. I have been 17 minutes, I think by the clock. And I will hold back those questions or I will ask them now.

They are very quick, very simple and then, as far as I know, I am through.

Senator STENNIS. Well, the Chair is inclined to recognize the Senator for the 3 questions and we will convert the 10-minute rule into a 15-minute rule and then start over; is that all right?

Senator SYMINGTON. Will the Chair yield, as long as the Chair brought that question up.

I started interrogating Secretary McElroy at 20 minutes of 6. At 6:30 they called it off and at 11:30 they said they would bring him back in again if we wanted to question him.

I started questioning Secretary Quarles at 20 minutes of 11, and finished at 11:30 after making the rounds on the basis of the 10-minute rule.

I would hope we could work it out as we do in other committees that I am a member of so that the low people on the totem pole like myself have some time to question the witnesses during normal hours. I thank the chairman.

Senator STENNIS. The present occupant of the Chair yielded his time.

Let's make this a 15-minute rule with special recognition to the Senator from Massachusetts.

Senator SALTONSTALL. Thank you, Mr. Chairman.

Changing the subject, do you stand by your speech of December 5 as you gave it?

Mr. HOLADAY. Yes, sir.

HIS IDEA WAS TO STIMULATE PEOPLE

Senator SALTONSTALL. And that speech, in your opinion, was a stimulating speech and not in any way a speech of complacency or a speech that might give an impression of complacency to people of America?

Mr. HOLADAY. I wrote it in the face of trying to stimulate people to move, not to be complacent; yes, sir; and I stand by it.

Senator SALTONSTALL. Now, the counsel brought out a great many criticisms of difference of opinion, based on differences of opinion between military research groups such as the Naval Institute and some civilian research groups.

You have been in the research business all your life.

Did you ever see a time when the civilian research groups and the military research groups were in entire accord?

Mr. HOLADAY. No, sir.

Senator SALTONSTALL. And they never will be, will they?

Mr. HOLADAY. We can hope for that but I am afraid they never will be.

Senator SALTONSTALL. Just one final question.

Do you conceive it to be your job to knock out the bottlenecks wherever they occur, in research and development or in the operational stage of ballistic missiles?

Mr. HOLADAY. Yes, sir.

Senator SALTONSTALL. And you are going to do everything you can to knock those bottlenecks out and accelerate the program?

Mr. HOLADAY. Yes, sir; I hope we have taken out a good many of them already and we will continue our efforts along those lines.

Senator SALTONSTALL. Thank you, sir.

Senator STENNIS. I thank the Senator from Massachusetts. The Senator from Tennessee, Mr. Kefauver.

Senator KEFAUVER. Thank you, Mr. Chairman, and when I get to 10 minutes, I wish the Chair would let me know.

Senator STENNIS. Yes.

Senator KEFAUVER. Mr. Holaday, I have been very much impressed with your sincerity and with your great desire to get this program going.

I know that you are a good man and that you should have your part in the program, but I must say I know it takes time to get these lines of command straightened out and settled and it is such a complicated matter that it is still a lot of confusion to me as to who is going to do what and what you are responsible for and who has the final say-so about these matters.

DELINEATION OF MR. HOLADAY'S AUTHORITY

Do you consider this as a scientific or administrative position?

Mr. HOLADAY. Administrative.

Senator KEFAUVER. Have you been trained in administrative positions?

Mr. HOLADAY. Yes, sir.

Senator KEFAUVER. Where?

Mr. HOLADAY. A large portion of my experience has been in the administration of research and engineering work.

Senator KEFAUVER. In reading over the directive to you by the Department of Defense, the first part, upon the responsibility and authority, the Director of Guided Missiles will direct all activities in the Department as related to research and development, engineering, and production of guided missiles.

That is a rather broad and substantial authority.

Then it seems to me that the second two points cut down on your responsibility and your authority. That you will report directly to the Secretary of Defense.

So, are your actions, the decisions you make, the orders that you give the Secretaries of the Army, the Navy, and the Air Force all subject to review and change by the Secretary of Defense or do you have the final say-so yourself?

Mr. HOLADAY. I think it is only fair to say that in my understanding of it the Secretary of Defense has the power to overrule me.

As I explained this morning, after we have established our policy, I proceed, and in line with good organization, I think he has the power to overrule me, if he is not satisfied with my decisions.

Senator KEFAUVER. So what this comes down to is that you are really the executive assistant for the missile program. Is that the way it finally works out?

Mr. HOLADAY. Well, I don't know just what you mean by that term.

Senator KEFAUVER. Well, I really feel, sir, that all of this missile, satellites, space and research and development for military and non-

military purposes ought to be under somebody directly who has the final say-so about it.

I have been impressed with the idea of a separate Cabinet position eventually. I know you cannot unscramble eggs that are already scrambled.

But what I am trying to find out is, are you responsible or is the Secretary of Defense responsible?

Mr. HOLADAY. Well, certainly, sir, with the power which I have, I proceed after we have established a policy, and that authority of course will only last so long as the Secretary and I understand each other and we work in the interest of moving ahead.

I would become quite discouraged, I feel, if the Secretary started overruling me.

Senator KEFAUVER. In other words, as long as he agrees with you or you reach a meeting of the minds, why, then, well and good, but if he has one opinion and you have another opinion, his opinion will prevail; is that correct?

Mr. HOLADAY. Yes, sir.

Senator KEFAUVER. You have authority over missiles, you have authority, did you say, to direct the Secretary of the Army, Navy, and the Air Force what to do and what not to do, to cause them to inaugurate programs, to stop programs, as you desire it in this missile field.

Mr. HOLADAY. Yes, sir.

Senator KEFAUVER. Is that subject to review or to change by the Secretary of Defense?

Mr. HOLADAY. Yes, sir.

Senator KEFAUVER. And you have this authority over missiles but you said the basis for launching them, this didn't come under your jurisdiction?

Mr. HOLADAY. I beg your pardon?

Senator KEFAUVER. The bases for launching missiles did not come under your jurisdiction?

Mr. HOLADAY. That is right.

Mr. WEISL. They did not?

Mr. HOLADAY. The working of the base, the training, the ground support equipment, and the missiles into an entire patter is all in my area of responsibility.

Now where the base is located, and the method of deployment and launching of a missile is a military decision.

Senator KEFAUVER. And does not come under your direction and jurisdiction?

Mr. HOLADAY. I am not an expert in fighting the war.

LOCATION OF BASES A MILITARY DECISION

Senator KEFAUVER. I mean, somebody has got to have a say-so about the bases. Do you or do you not have a say-so?

Mr. HOLADAY. I have a say-so in seeing that the base and missile fit together.

But where the base is located, in what part of the world it is located, is a military decision and the method by which the missiles will be deployed is a military decision.

Senator KEFAUVER. Now, the second limitation in the directive is that you use the personnel and certain staff and appropriate staff members.

So you are limited by the personnel that are set up by somebody else.

In other words, you don't have direction over the personnel, the manpower that will work on these programs.

Mr. HOLADAY. No, sir.

Senator KEFAUVER. I could not get clear whether you had the right of allocating funds or whether that was the Secretary of Defense's responsibility or the Comptroller's responsibility. That is, if certain funds are available you can allocate so much for this and so much for that. Is that your responsibility or whose is it?

Mr. HOLADAY. As the money that is appropriated for a missile program, as it has been in the past for ballistic missiles, moves into the Department of Defense, we freeze that amount of money and we approve the expenditures of those funds, the programs and the expenditures of those funds.

Senator KEFAUVER. Is your say-so final or who has the final voice in that matter?

Mr. HOLADAY. Sir, this can probably be, in effect, the Bureau of the Budget who might say that he was not going along with that expenditure of money. In this particular case I would have to take this to the President to have it resolved. If it happened to be within our own office, in which Mr. McNeil would raise a question as to the moving of money over, I would have to take that before the Secretary of Defense to have it resolved.

Senator KEFAUVER. Well, in other words, you do not have the final authority, as I understand it.

Mr. HOLADAY. That is right.

Senator KEFAUVER. What is your relationship, Mr. Holaday, with Dr. Foote, the Assistant Secretary for Research and Engineering? Can you give him orders, tell him what to do, or just how do you work out matters with him?

Mr. HOLADAY. No, sir. That is purely a coordinating job. I do not give Dr. Foote any orders. They carry on, as you well realize, a lot of the research work, so we work very closely in this area, and I use quite a good many people on his staff to assist us in our program.

Senator KEFAUVER. So that is a cooperative arrangement, and you are not his boss and he is not yours, as I understand it.

Mr. HOLADAY. That is right.

Senator KEFAUVER. Both are responsible to the Secretary of Defense.

Mr. HOLADAY. Yes, sir.

Senator KEFAUVER. Then I think Senator Saltonstall pointed out something that I know I am also worried about, and that is, I take it the Defense Department is primarily concerned with research and development that has to do with the making of weapons. What are we going to do about these programs in which there is no immediate relationship to weapons?

In other words, well, the space program, that is going to be a separate department in the Defense Department on a co-equal basis with you? Is that what I understand you to say?

Mr. HOLADAY. Yes, sir.

Senator KEFAUVER. And do you have lines of demarcation clearly set as to what part of the matter you handle and what part they will handle?

Mr. HOLADAY. No. This has not been clearly defined.

Senator KEFAUVER. It is going to have to be, is it not?

Mr. HOLADAY. Yes, sir.

Senator KEFAUVER. Then how about these scientific developments which are purely scientific, which have no immediate military significance, such as the weather and the study of cosmic rays, things that Dr. Teller talked with us about? Is that going to come under you, or under whose supervision will that be?

WEATHER CONTROL RESEARCH UNDER NEW AGENCY

Mr. HOLADAY. Of course, weather has always been worked on to a great extent by the services themselves. A lot of the scientific program will continue in the space area, reconnaissance satellites, and things of that type, will be in the space-satellite area.

Does that answer your question?

Senator KEFAUVER. You mean it will come under this new agency that is going to be established?

Mr. HOLADAY. Yes, sir.

Senator KEFAUVER. Is that correct?

Mr. HOLADAY. Yes, sir.

Senator KEFAUVER. I just want to say, Mr. Holaday, that I think by airing these matters out here and asking questions, it may eliminate some of the confusion, and maybe you, the President, or someone could get down to making clear lines of demarcation.

But it does seem to me that there is still a whole lot of confusion as to who is going to do what, and who is responsible for what, and who you report to, and just how much authority you have.

Do you not feel that there still are some unsettled matters, and many of them, in your job?

Mr. HOLADAY. Sir, I will have to agree with you. I have tried the best I can to help you.

Senator KEFAUVER. I know, and I know you are doing the best you can. But I do feel, though, it is going to take a whole lot of aggressiveness to get the kind of authority that you are going to have to have to get this job done, Mr. Holaday.

Mr. HOLADAY. Fortunately, I have had wonderful cooperation from all of the people that are helping me, and I certainly need lots of help.

If that cooperation would discontinue, I would be in trouble.

Senator KEFAUVER. Thank you, Mr. Chairman.

Senator STENNIS. I thank the Senator from Tennessee.

Secretary Flanders, you are next.

Senator FLANDERS. Yes, sir. Thank you, I am not a Secretary. I am a Senator.

Senator STENNIS. You are qualified to be both in one.

Senator FLANDERS. I hope that is not taken off my time.

Senator STENNIS. I will give you Cabinet rank any time you wish.

Senator FLANDERS. Thank you.

ANALOGY BETWEEN LAUNCHING MISSILES AND LAUNCHING SATELLITES

Mr. Holaday, is it proper to suggest or to think of launching a missile, launching a warhead, and launching a satellite, as being about the same problem? One missile, if you want to call it, contains a warhead, and another of somewhat the same characteristics carries a satellite?

Mr. HOLADAY. They certainly are within the same field of technical accomplishment. The techniques and approaches are somewhat different.

We have to have high accuracy in both of them, and we have to have launching power to lift into the outer atmosphere either the ballistic missile warhead or the satellite, so they are quite comparable in that sense.

Senator FLANDERS. I asked this question because I am a little bit disturbed about this separation of powers and duties. I am afraid that a new organization will start out and have a missile structure of its own, and that then we will have instead of the example of Thor and Jupiter or Titan and Atlas, we will have a third. We will have three of them. I wish they had kept it within your jurisdiction, because it seems to me that it lies within your sphere of competence and activity.

I just make that as a statement. I do not ask you to answer it as a question.

Mr. HOLADAY. Thank you. I appreciate not having to answer it.

Senator FLANDERS. Assuming that the Air Force succeeds in retaining this new activity, would it be a good guess to guess that it would go to Ramo-Wooldridge?

Mr. HOLADAY. Sir, I would like to elaborate, if the chairman will agree to let you have a little extra time here in trying to answer that question, because in setting up this new agency I think we must understand that this new agency is not just going to grab every project away from any service that has carried forward research and development in this area, grab it away and pull it back in and say "You stop."

In carrying this work on, without any doubt the Air Force is well along in certain areas here. I am sure the new director that comes in in this area is going to coordinate, cooperate, and use the work and the effort that the Air Force has put into this field. This will become part of his field, but the money for supporting and doing it, he will have to supply, instead of the Air Force having to take it away from missiles or bombers or what have you.

So what I am saying here, in trying to help you out on it, we will use this method and technique. It has been done before. Whether Ramo-Wooldridge would be the advisers on it, I would say probably not because this man would have his own technical staff and he would be the technical adviser.

Senator FLANDERS. Thank you.

Now, Mr. Chairman, I would like to, if you think it proper, ask Mr. Holaday if he will provide for the committee a list of both guided and ballistic missiles defining their missions and present status of each in each service, and also give the prime contractors for each. I think it would be useful for us to have that before us.

Senator STENNIS. Very well. You want that supplied for the record?

Senator FLANDERS. Supplied for the record, yes. I do not expect you to give it offhand through the ear because that is something that needs to be seen by the eye.

Mr. HOLADAY. I wanted to point out, we are preparing a report which will be ready in about a week's time that will be quite complete, and I believe answer all your questions. So if I can have your questions, we will see that this report contains it.

Senator FLANDERS. And I would hope that it could be summarized in tabulated form so that we could see the whole thing at a brief inspection.

Mr. HOLADAY. Yes; I understand that. We will do that.

(The information requested of Mr. Holaday is included in the classified records of the subcommittee.)

Senator FLANDERS. I now want to ask you a technical question which I did not get satisfactorily answered out in Los Angeles, and so I come to the source of all wisdom, Washington, to ask the question.

What is the difference between guidance mechanisms in the missile and their controlling mechanisms? I gather that they are not the same thing.

Mr. HOLADAY. The guidance mechanism is the brains or the pilot which operates the controls. That is the shortest answer I can give you, sir.

Senator FLANDERS. I see. The guidance is the boss and the controls is the hired man?

Mr. HOLADAY. Yes, sir.

NOSE CONE PROTECTS SATELLITE UPON REENTRY INTO ATMOSPHERE

Senator FLANDERS. Now, the nose cone is simply the mechanism for setting off the warhead, the warhead and the mechanism for setting it off at the proper altitude and the proper time?

Mr. HOLADAY. No, sir. I believe we had better understand each other a little bit better here. When we talk about nose cones, we are talking about the protective material that is around the warhead?

Senator FLANDERS. Yes?

Mr. HOLADAY. To protect it on its reentry into the atmosphere.

Senator FLANDERS. It is a matter of protecting, simply of protecting the charge on reentry?

Mr. HOLADAY. Yes, sir.

Senator FLANDERS. I want to ask a couple of questions, Mr. Chairman, with relation to the short supply of scientists and engineers. When we hear testimony or when we see charts with regard to the organization of this undertaking in the Department of Defense, it looks to us terrifically complicated, and we have complicated it within the last 2 days by adding this new body concerned with the upper atmosphere.

To what extent in your observation and experience are first-class scientists and engineers short circuited or pocketed in this vast organization where they perform duties of coordination or duties of administration instead of working at the jobs for which they have been trained and for which they are eminently suited? Is there good use of our present existing engineering and scientific manpower?

Mr. HOLADAY. Sir, I do not believe it is perfect, again referring to my speech which I gave in New York. I approach this comment by

asking industry people to use 1 engineer to do the work of 2, or 1 engineer to do the work of 1, instead of 2 engineers to do the work of 1. I have a feeling that we are not using our technical people to the complete efficiency that they should be used. This is a very difficult thing to get ahold of, however. It gets down in all levels of management, and I think that people are doing a better and better job of it all the time to try and use these technical people to greater advantage.

DISADVANTAGEOUS USE OF SCIENTIFIC TALENT

Senator FLANDERS. Mr. Chairman, and our counsel, I would like to have this question raised with our outside sources of information as to whether they feel sufficient use is being made inside the Defense Department of scientists and engineers. Now, I have one other question to raise for the record, but not for you to answer, sir, because here you have no responsibility.

From time to time we see in the newspapers—and there was a time about a month ago of a particularly outrageous case—of a very highly competent mathematician who was doing some menial job as a non-commissioned officer, and finally—his record and his abilities were all on the punched card. I do not know whether the machine failed to pop him up or whether somebody looked at that card and misinterpreted the result from it or what. But I have the suspicion that there is an immense amount of inefficiently used ability in the Armed Forces of the United States, of which from time to time we get an example. I want simply, Mr. Chairman, to open this up at the present time as something which we may impress on the armed services to investigate, and in which I am sure they can do a better job. Thank you, Mr. Chairman.

Senator STENNIS. I thank the Senator from Vermont, too.

Mr. Holaday, you have been on the stand now almost 2 hours. Would you like to have a 5-minute break?

Mr. HOLADAY. No, sir, I would just as soon go right ahead.

Senator STENNIS. The vice chairman is next on the list here and he wants to open his 15 minutes by saying to the Senator from Massachusetts that his questions were very valuable a while ago and it was only in deference to Senators who are further on the list that I interrupted him. Certainly there was no defect in the quality and helpfulness of his questions. If he had special points further he would like to make now and felt cut off, I would be glad to yield him half of my time, half of the 15 minutes.

Senator SALTONSTALL. Mr. Chairman, after that courteous remark, my mind is a blank.

Senator STENNIS. Mr. Holaday, I have been impressed with your testimony and you have an impressive biography here. You are primarily an engineer, is that correct?

Mr. HOLADAY. I graduated from an engineering school, yes, sir.

Senator STENNIS. And you have had engineering and administrative experience of course, and now more recently, research. That is your background of your life's work.

Mr. HOLADAY. I started in with research followed by combined research and engineering.

Senator STENNIS. Just what is your present title?

Mr. HOLADAY. Director for Guided Missiles.

Senator STENNIS. Director for Guided Missiles. I think one major thing this committee and the people want to know is just who is in charge of this missile program. Even though you are named Director, I believe you said a while ago that should a matter arise in conflict with the position of Dr. Foote, who is the Assistant Director for Research and Engineering, that you would not have any authority over him; is that correct?

Mr. HOLADAY. Well, if the work in his office was in the area of guided missiles, research work, I would say yes, we have direction over him. But in the other areas in which he is working, which are many, I would have no authority over him.

Senator STENNIS. That clears the point up then. On matters pertaining to your work in the guided missile area, you would have superior authority. Now, if you should want to take a certain step, though, and if the Secretary of Defense did not agree with you, I mean a step on your missile program of which you are Director, and the Secretary of Defense did not agree with you—you would be cut off or blocked off there, would you not?

Mr. HOLADAY. Yes.

Senator STENNIS. By the Secretary of Defense?

Mr. HOLADAY. Yes, sir; the Secretary has the power and authority to overrule me.

Senator STENNIS. So that would terminate your real directorship right at that point, right at the point where you had this conflict of conclusions with the Secretary of Defense; is that correct? You would no longer be Director of this missile program, should that occur; is that correct?

Mr. HOLADAY. On that single item that certainly is true.

Senator STENNIS. I mean on this mission and that is your single mission now, is it not, missiles?

Mr. HOLADAY. Yes. But I certainly assume that this would be in some area of the entire missiles that he might overrule me, and that therefore in that particular area, having overruled me, I would say he becomes the director instead of myself.

Senator STENNIS. These are not critical questions. It is just a question of power and authority and the ability to plan, and then the ability to act.

Mr. HOLADAY. That is correct.

Senator STENNIS. So should there be this conflict, then, directly on a major matter concerning your missile program that you were directing, a conflict occurring with the Secretary of Defense, he would have the final say?

Mr. HOLADAY. Yes, sir.

IF BUDGET BUREAU WITHHELD FUNDS, APPEAL WOULD GO TO PRESIDENT

Senator STENNIS. The same is true now even though you and the Secretary of Defense should agree, if the question involved was money or funds. Assuming the money had been appropriated, it is still under the control of the Director of the Budget Bureau, Mr. Brundage. So even though you are director of this program, missile program, and reached a plan and a conclusion and a decision and undertook to carry it out, Mr. Brundage, by withholding the funds, could stop you at any point; is that correct?

Mr. HOLADAY. Yes, sir.

Senator STENNIS. So you are not Director beyond his decision with reference to money?

Mr. HOLADAY. Yes, sir. We would go to the President to ask to have that rescinded.

Senator STENNIS. That was my next question. The President is a very busy man, necessarily so. Your next step would be to go to Dr. Killian or to the President?

Mr. HOLADAY. To the President.

Senator STENNIS. You would go to the President?

Mr. HOLADAY. Yes; we certainly would discuss it with Dr. Killian and would have him go with us.

Senator STENNIS. I am sure you would, and it would be valuable advice that he would give you, but still it would be just advisory?

Mr. HOLADAY. Yes, sir.

Senator STENNIS. What Dr. Killian said?

Mr. HOLADAY. Yes, sir.

Senator STENNIS. Going back just a second, on this difference you had in opinion with Mr. Brundage, you would nevertheless be stopped on your program even though the Secretary of Defense agreed with you, because the Director of the Budget would be superior in money matters to you and Mr. McElroy, the Secretary of Defense? That is correct, too, is it not?

Mr. HOLADAY. That is my understanding.

Senator STENNIS. So if this situation developed on money, and if you and Secretary McElroy did not agree, you would have to go to the President alone, would you not, and that raises the question, do you have the authority to take this matter to him without Secretary McElroy's consent? I want to be sure that I have made my question clear.

Mr. HOLADAY. Yes, I understood your question, I think.

Senator STENNIS. When I said "to him," I mean to the President, without Secretary McElroy's consent.

Mr. HOLADAY. I personally would not go out of line to do that. I would think this would be going out of line.

Senator STENNIS. I would think that your decision on that would be correct, sir. So you with the title of Director of Missiles, you are still so hemmed in that you cannot even go to the President of the United States with a problem or with a decision that you are stopped on, without the consent of the Secretary of Defense; that is correct; is it not?

Mr. HOLADAY. That is true. I am sure that if I felt this way, I would go to the Secretary and ask him to go with me to discuss it before the President, and I am sure that being an industry man, with the kind of background and training we have, he would go with me.

Senator STENNIS. These are no reflections on Mr. McElroy, with whom we were well impressed, or Mr. Brundage either. But this comes to a matter in Washington of who has the power, and I want to make the record clear as to what power you do have, and then where this power does stop.

So if the Secretary of Defense agreed on this matter to let you go to the President, even though you would have to go and tell him that it was a matter that you and the Secretary of Defense were not

together on, you would go on up, but without the blessings, if you may put it that way, of the Secretary of Defense?

Mr. HOLADAY. I do not think I would go up, sir.

Senator STENNIS. You would not go at all?

Mr. HOLADAY. Without the approval of the Secretary.

Senator STENNIS. I would certainly think that you would be at a disadvantage to go without him.

So by a brief review then, you could be stopped entirely by the Secretary of Defense, one member of the Cabinet, or by the Director of the Budget, either one or both?

Mr. HOLADAY. That is right.

SOLUTIONS OF THE "NEED TO KNOW" QUESTION

Senator STENNIS. May I ask you just a few questions here, and I will read the entire paragraph first, and then read it to you with my question again. I have a letter here that has just come in from the Aeronutronic Systems, Inc., a subsidiary of Ford Motor Co. It is in response to a letter from the counsel for the committee and is signed by Mr. David Altman, head, Propulsion Department.

(The letter referred to is as follows:)

AERONUTRONIC SYSTEMS, INC.,
Glendale, Calif., December 11, 1957.

EDWIN L. WEISL,

Special Counsel, Senate Preparedness Investigating Subcommittee, United States Senate Committee on Armed Services, Washington, D. C.

DEAR MR. WEISL: I am replying to the letter you recently sent me concerning my views on the conduct of our missile and satellite programs. My contact with the program was initiated in 1945 and for many years I was directly involved in the research and development of propulsion systems. During the last few years, my concern has been oriented toward propulsion requirements of our various missiles as used for defense and scientific missions.

In responding to the questions posed, I have attempted to phrase my replies in broad terms so that they might be useful, or at least suggestive, at a national level. Consequently, objections which were symptomatic of only a single program are not discussed. I have omitted a number of criticisms where recommended alternatives appear to create different but equivalent objections.

The use of scientific manpower in the missile program has been reasonably adequate but the same is not true for our satellite program. The latter has been a nonpriority program with a loose and ill-defined management until very recently. Because of the low budget, poor management, and lack of priority, it was difficult to obtain the most qualified manpower on the program.

A bottleneck in research and development which appears more or less common in all programs is the restricted flow of technical information. The reasons appear to be inter- as well as intra-service rivalry and propriety interests. Information which flows most freely is basic research and early models of engineering developments. The tool employed for creating this restriction is the "need to know" requirement, an important but often abused power. It is true that a qualified individual or group will eventually receive the required information but frequently too late to use or at the expense of a delayed program.

A second type of bottleneck frequently occurs in a program for purely technical reasons resulting from poor planning. Sometimes when a poorly conceived program passes the Government evaluation committee, the modifications subsequently made in the conduct of the program result in great expense, loss of time, and reduced efficiency. An example of this type of bottleneck occurs in our Vanguard program. The Navy Vanguard missile program was originally sold largely because "off the shelf" engines could be used thereby making possible a low-cost program on a shortened time schedule. Specifically, it was claimed that the Viking and Aerobee engines could be used. As the program progressed, however, three new engines were authorized for development which contributed to the almost tenfold increase in program cost over the original estimate. In all fairness, responsibility for part of this blunder must be charged to the original

Department of Defense Satellite Committee which apparently failed to realize that the engine modifications to the Viking and Aerobee required for fulfilling the mission were tantamount to new engine developments.

Bottlenecks have occurred in the production of some of our earlier missiles such as Redstone, Corporal, Sergeant, and others but I believe that these are being eliminated in the later programs, such as Jupiter, Thor, Atlas, Snark, etc. These bottlenecks occurred in the transition from research and development at one organization to production at another. The bottleneck, when it occurs, is very costly in time, money, and operational reliability as evidenced in the Corporal program.

RECOMMENDATIONS

1. *Centralized management.*—I am convinced that one of the major bottlenecks to the conduct of both the research and development and production aspects of our missile program is derived from the multitudinous levels of responsibility and authority. The major cause is derived from assigning almost total responsibility to three services with their long chains of command. A strong central management should be located in the Department of Defense which maintains prime responsibility for the evaluation and coordination of all missile programs. Delegation of authority and responsibility for the origination of and liaison with particular programs may be assigned to the individual services. This move is of utmost significance and I believe that many of the objections which I and others have cited will be at least partially dissolved in a natural fashion under a more unified management system.

2. *Combination of missile and satellite programs.*—The satellite missile differs very little from the ballistic missile since the engine performance requirement is only 10 to 20 percent greater than that of an ICBM. As a consequence, differences between the missiles are only matters of degree rather than kind. Continued separation of the two programs can only lead to inefficiency and wasteful duplication of missile components. The Vanguard program is a pertinent example illustrating this argument. At least two of the engines for the Vanguard missile are unique and probably will not find application in other defense missiles. However, if engines from the missile programs had been made available for the Vanguard, a satellite missile of far greater capability, reliability, and less eventual cost would have resulted. I should like to maintain, however, that the major justification for combining the missile and satellite programs stems from the fact that the two differ only in a small matter of degree rather than kind, and that both programs have much to gain by combination of effort. This recommendation implies, therefore, that the Department of Defense set up a space-flight group which is responsible to the missile program manager. Suitable priority can be assigned to the satellite division from time to time as the military demand requires.

3. *Advanced systems planning.*—In addition to the special advisory panels in the Office of the Assistant Secretary of Defense for Research and Engineering (propellants, engines, guidance, etc.), a system panel should be formulated, whose prime function is to coordinate all the recommendations of the specialist groups with the requirements of the services. This systems panel will have several major responsibilities. It will study in detail the technical requirements of existing and future missions, and make recommendations in the research and development area which will keep our national program abreast of obsolescence. This coordinated study will provide the most efficient use of existing manpower, facilities, and technology, since it will result in a recommendation for the development of the least number of versatile missile components to satisfy both present missions and those in the immediate future. As an example, careful planning can result in a minimum number of engines to satisfy all contemplated programs. It is obvious that as development is concentrated on a minimum number of versatile engines, the result is reduced cost, increased efficiency, and most important, increased reliability. The systems groups which presently exist in the individual services I believe to be inadequate because they do not combine the requirements of all services and they are not staffed with suitable civilian personnel. Because of the importance of this combined group of component and system panels, they should be placed at a high level in the Department of Defense. Their recommendations should be delivered directly to the missile manager regarding the sponsoring or cancellation of programs.

4. *Research application.*—Our present research and development effort should be expanded slightly, but most important of all, an effort should be attached to monitoring the research programs. A large number of well-conceived research ideas are frequently permitted to drift along endlessly for several years because of

the lack of monitoring at a high enough level where the authority exists for translating the program into engineering development.

Experience for making such an important judgment takes years to develop but I think there are qualified individuals at present who have developed sufficiently good judgment to evaluate the potential of current research programs. A number of long-range missions are presently delayed because of poor timing in the transition to engineering development.

5. *Controlled duplication.*—Duplicated programs should be reviewed periodically and no less frequently than on an annual basis. Some duplication, particularly on essential programs, is necessary as a backup. However, when permitted to continue, there results a waste of time, money, and manpower. Interservice duplication has been more difficult to eradicate under the present management system but can be controlled with strong centralized management in the Department of Defense. I would like to suggest that the important criterion for justifying duplication be a difference in concept for accomplishing the mission rather than a difference in personnel employing a similar concept. The present duplicated programs such as the Atlas-Titan-Snark; Jupiter-Thor-Polaris; Corporal-Sergeant; etc., should be periodically evaluated in terms of their state of development, usefulness, and probable obsolescence.

6. *Flow of information.*—A centralized information agency should be formed with the prime function of studying the technical communication problem between the various organizations engaged in missile programs. This agency should also have access to information gathered by the Central Intelligence Agency on foreign developments. Such information should be disseminated to organizations capable of benefiting. As a specific illustration, information on the Russian missile capability has not been disseminated to organizations who have the responsibility for developing similar components in this country. By studying the details of the Russian program and philosophy, information can be gleaned and evaluated in terms of usefulness in our program.

7. *Educational program.*—In order to provide for a sufficient quantity and quality of scientific manpower in the future, a broad educational program should be initiated. This can take the form of Government scholarships, subsidized foreign translations of periodicals and books, and Government-sponsored movies and television programs. Thus, by stimulating interest through the mediums of literature, movies, and television and by the provision of scholarships in science, an adequate and high quality of scientific manpower will result.

Very truly yours,

DAVID ALTMAN,
Head, Propulsion Department.

Senator STENNIS. One paragraph here attracts my attention. He says on page 1:

A bottleneck in research and development which appears more or less common in all programs is the restricted flow of technical information. The reasons appear to be inter as well as intra-service rivalry and proprietary interests. Information which flows most freely is basic research and early models of engineering developments. The tool employed for creating this restriction is the need to know requirement, an important but often abused power. It is true that a qualified individual or group will eventually receive the required information, but frequently too late to use it, or at the expense of a delayed program.

Let me read the first and last sentences of that and ask one question.

A bottleneck in research and development which appears more or less common in all programs is the restricted flow of technical information, the reason appearing to be inter as well as intra-service rivalry * * *. It is true that a qualified individual or group will eventually receive the required information, but frequently too late to use it, or at the expense of a delayed program.

Now, what is your comment in reference to that observation here of this gentleman?

Mr. HOLADAY. Sir, I have to agree that it is probably correct because of the number of people that I have talked to in industry that run into this difficulty, and the time and effort I have to devote to getting the right information to them. There is apparently quite a bottleneck here in this particular area. As I pointed out this morning,

I don't know the answer how to get to this, but it is something that we are working on and is in an area in which we need to make more progress.

Senator STENNIS. I have been on the Armed Services Committee a few years and know of the very fine and high quality men our officers are, but at the same time, I could see where this could exist without them being too much to blame for it individually.

Mr. HOLADAY. Yes, sir.

Senator STENNIS. But do you not think it is one of the things that you must delve into and reach and pull out and get some kind of an answer to it to help this program move along?

Mr. HOLADAY. Yes, sir.

Senator STENNIS. Are you giving that special attention now?

Mr. HOLADAY. I am giving it attention. I am afraid I cannot straighten it out enough to give it all the attention it needs. I cannot spread myself too thin.

Senator STENNIS. You have someone helping you look into it, I hope.

Mr. HOLADAY. Yes, it has been looked into for quite some time, and we don't seem to be able to get the answer yet. The answer is very elusive and very difficult to get hold of. I am in the hopes that some of the discussion that has been held here now will assist in easing this situation.

Senator STENNIS. Why, you must have more power to get more results, and I would not embarrass you by asking you to call on past judgment on the amount of power or your lack of it, but I believe that at this point you have very frankly answered as you have as well as the illustrations here of your limited power, after all these and other matters clearly illustrate the necessity of having to empower someone as director of missiles that has the authority to make a plan, and then make the plan work and carry it through, if necessary, over any roadblock or restriction that might occur from the Budget Bureau, the Secretary of Defense or anyone else, subject only, of course, to the President of the United States.

I hope that some vehicle of that kind will quickly evolve because I believe we are burning a lot of daylight, and I commend you for your efforts and your work.

Mr. HOLADAY. Thank you, sir.

Senator STENNIS. I believe that Senator Bush is next.
Senator Bush?

ON THE QUESTION OF SAFEGUARDING CLASSIFIED INFORMATION

Senator BUSH. Mr. Chairman, before I ask any questions, I desire to use part of my time to make a statement for the record concerning a matter with which I am very much concerned about.

I have been deeply shocked by the failure of this subcommittee to safeguard secrets entrusted to it in executive session, and by the failure of some elements of the press to refrain from publishing information which may be of great value to our potential enemy.

Mr. Allen Dulles, Director of the Central Intelligence Agency, testified before us when these hearings began 2 weeks ago: because public disclosure of the information he wished to present might endanger the security of the United States, we heard Mr. Dulles behind closed doors.

The session was so closely guarded that even United States Senators who were not members of the Armed Services Committee were excluded by order of the subcommittee chairman.

Yet a few days later articles began appearing in various news media purporting to report what Mr. Allen Dulles told us.

For example, the December 9 issue of Newsweek magazine on page 58 under the headline "Russia's missile firepower—cold facts," published an article purporting to give an account of our briefing by Mr. Allen Dulles.

I do not intend to give aid and comfort to the enemy by confirming or denying anything which appeared in that article, but there is some evidence that it may have been written on the basis of information which had been leaked to the writer by someone among those present at this briefing.

I recognize the right of the American people to know all the facts concerning our national security which can be disclosed with safety.

I recognize that publishing is a fiercely competitive business and that reporters and editors work under great pressure to produce scoops.

But Mr. Chairman, the right of the American people to survival is superior to their right to know.

If we hand all our secrets to our potential enemy on a platter by publication in the press, the American people may find themselves well informed but vanquished.

Breaches of security are not confined to this one instance. Almost every day we pick up our newspapers and magazines and find published information which might endanger our national security. One may sometimes wonder why the Russians bother to have a spy system when so much of the information they seek is printed in the press, and I recall, I may say parenthetically, that Dr. Vannevar Bush made that observation himself, when he was a witness here before this committee.

Mr. Chairman, we should talk less and publish less and accomplish more. I hope that in these dangerous times a higher sense of responsibility for safeguarding national secrets will guide both those privy to such information and also members of the press.

There has been too much pressure for secret information on the part of the press and too much loose talk by some people in official life.

The breaches of security which followed Mr. Dulles' secret testimony may well hamper the work of this committee, this subcommittee. It undoubtedly will be necessary to hold future executive sessions in order to obtain top secret and secret information about our missile programs.

Mr. Holaday has said that some of the information which counsel sought from him this morning could only be given behind closed doors.

In view of the leaks which followed Mr. Dulles' appearance, what Government official can be sure that classified information he provides us will not be turned over to Russians via the press?

It may well prevent a full disclosure which the Armed Services Committee should have in order to form intelligent judgments.

Mr. Chairman, I hope we may have an opportunity to discuss this matter further when the committee meets in executive session.

LEAKS CITED BY SENATOR JOHNSON

Senator JOHNSON. I should like to say for the information of the committee that I talked to the Senator from Connecticut about this matter briefly this morning.

I deplore as he does any information that is ever given in executive session being revealed. I don't think that I have ever been guilty of that in the 20 years that I have served on the Armed Services Committee.

I see in the newspapers leaks that come from my colleagues every day, from Senators every day, and also from the executive department every day.

I will say to the Senator from Connecticut that I hope he will send a copy of that to the executive department, because I have obtained a great deal of my information on foreign and domestic policy from the front page of the New York Times.

I don't condone leaks. I don't know which one of the Senators gave it out if any Senator actually gave it out or if a member of the staff gave it out.

It seems that Mr. Dulles had his opinion about who might have when he discussed it with some members on this side of the aisle and he had his opinion of who might have when he discussed it with the Senator from Connecticut and they were two different people.

Senator BUSH. He did not mention any person in discussing it with me.

Senator JOHNSON. I thought the Senator gave me the definite impression that he felt that it was some particular member this morning.

Senator BUSH. He may have had one in mind, but he did not mention him to me by name.

Senator JOHNSON. I did not get the full implications of the Senator's statement. I thought that he felt that perhaps it was a member of the majority.

Senator BUSH. He may well have thought that but he did not give me any name.

Senator JOHNSON. That was the impression I got from the Senator.

Senator BUSH. The Senator might have gotten that impression.

Senator JOHNSON. Did the Senator intend to leave that impression?

Senator BUSH. I did not say it was my impression.

Senator JOHNSON. Did the Senator say it was Mr. Dulles' impression?

Senator BUSH. I said that Mr. Dulles voiced the thought that it might have been some Senator, but he did not pinpoint it at all.

Senator JOHNSON. I thought the Senator—

Senator BUSH. The chairman here and I are getting into a little bit of an argument now.

We are both on the same side I think, but the chairman's suggestion to me when I spoke to him privately was that possibly this had been one of my colleagues on the Republican side.

Senator JOHNSON. That is correct.

Senator BUSH. I said possibly it was, but I did not think it was Mr. Dulles' thought when he spoke to me.

Senator JOHNSON. I think that was the thought when he spoke to us, so whether it is a Democrat or a Republican, I guess it is being played both ways. It is a situation to be deplored, and I do deplore the action. I have limited the number of people to attend this to as

few as I can. I have asked my colleagues who are not members of the full committee to not even participate.

I asked Senators who are not members of the Armed Services Committee to leave the room. I confined the staff group to a very limited few, all with the highest clearance. I deplore what has happened, although I will say to the Senator that it is not unusual, that it has happened in the legislative branch before. On practically every briefing, some kind of information comes out of it.

When we learn to control Senators, why you will have a formula that I have not been able to obtain.

I hope that the Congress never provides as many leaks as the executive department does. I have felt for some time that a great deal of the information that I am able to get on foreign and defense policy first was revealed through the press.

Senator BUSH. Mr. Chairman, may I say first in raising this point I did not raise it on a partisan basis.

Senator JOHNSON. Nor did I.

Senator BUSH. I did not do it with any implication that it might have been a Senator on your side of the table or on this side, because I honestly don't know.

I did raise it after you told me that it might be one on my side, and I just want to make it clear that I do not raise this as a partisan matter.

The chairman has been very wise and very diplomatic in keeping these hearings on a nonpartisan basis, and I certainly do not want to appear not to fully support him in that very worthy effort, so I trust the Senator will understand me fully on that point.

And I further thank the Senator for putting in the record that I did discuss the matter with him before I ventured to make my statement, and told him I intended to make some remarks on this subject.

Senator JOHNSON. The chairman did not hear all that the Senator from Connecticut said but what he hear he fully embraces and he does not seek to sit in judgment on his colleagues. He does not know or does not care which side of the aisle it came from. He trusts it won't be repeated. He has pleaded with the Senators to observe the rules under which this information is given to us, and when he was first notified of it in Texas and asked for his comment, he said that I would not attach much importance or much credence to any information that came from a person who received that information about his country as top secret information and then revealed it.

I would not give much credence to it, and I think that that is the way that type of information ought to be treated.

I hope that we don't spend a lot of our time trying to give out top secret information that can help only the enemy.

I appreciate what the Senator has said.

Senator BUSH. Mr. Chairman, I just want to make it amply clear that my comments are not even remotely to be considered as any criticism of the chairman.

On the contrary, I feel that he is doing a splendid job here, and I support everything that he has done. I also support his statement about the executive branch in matters of this kind, and I hope that they will pay some attention to these remarks, if they ever do come to their attention.

Senator JOHNSON. I appreciate very much the high level of the Senator's statement, and I think if he has concluded, that is a good time to end.

Senator BUSH. I have concluded the statement but I wonder if the Senator would not let me finish my time.

Senator JOHNSON. Sure.

Now will the Senator yield for me to make a very brief statement?

Senator BUSH. I will be glad to yield for that purpose.

REMARKS ON PRESIDENT'S TRIPS TO NATO MEETING

Senator JOHNSON. While we are in such perfect accord, I should like to report a matter to the members of the committee. When we lunched together today and I told the members of my understanding that the President was leaving at 5 o'clock this afternoon to attend the meeting of the North Atlantic Treaty Organization, and that I felt that I would like to call him and say to him that the members of the committee, both Republicans and Democrats, were thinking of him, and that our thoughts and our prayers went with him as he left, and we hoped that he would have a successful meeting.

I did call him and told him that yesterday I had been asked a question in a speech that I was making in Texas about the matter, and I stated that I thought he was going at a great sacrifice.

Certainly he was not going as an Atlantic sightseer, or a tourist because he had seen Paris before, but he was going because he believed that with all of his heart and head that he could make a contribution to preserving the freedom in the world.

I told the President that as far as some dozen Senators present today were concerned we realized this meeting was of great importance, that we felt that he should know that we wanted him to go as President of the whole United States, and that we wished him Godspeed and every success, and that he would find us helping him in every way we could.

He said he was very touched by our thoughtfulness in calling him, and that it would strengthen him on the mission which he was undertaking.

I wanted to report that to my colleagues. He said that he wished that I would say to each of them that he thanked them from the bottom of his heart for their thoughtfulness as he undertakes this very important assignment.

I thank the Senator for yielding to me.

Senator BUSH. I just want to applaud your statement to the President. We are all in full support of it.

Mr. Holaday, possibly this little interlude has given you a little relaxation here and it might be well.

Mr. HOLADAY. I took a little relaxation; yes, sir.

Senator BUSH. Let me ask this question.

The question before us most frequently seems to resolve around the question of some sort of unification.

Can't we do something to eliminate the rivalry between these armed service organizations?

And there seems to be too much competition, more competition than cooperation almost between the services in connection with this whole missile program.

I wonder if you can answer this question.

If we were starting afresh, and knowing what we know today about the rivalry between the services and so forth, and so on, do you think it would be practical if we developed a unified approach and had just one missile program, one missile organization which might be like the United States Air Force, let's call it the United States Missile Force, or a unified command which could administer the entire missile business, the research and development end, the manufacturing end, the contracting end, and then turn over to the armed services these missiles for use as the high command where the military thought they were best suitable for use?

My question, to repeat it, is if we were starting now do you think it would be better to approach it that way, or would we be better advised to let each service go out and see what it could do in the field, which seems to have been the way it has happened during the past 8 or 10 years?

Would you care to comment on that or not?

THE MOVE IS TOWARD CENTRALIZATION OF MISSILES RESEARCH

Mr. HOLADAY. I will try to comment on it, and I will of course express my personal views and experience.

Certainly, you could separate out a research and development area on missiles and carry it out in one section or area.

I think this is the direction in which we are moving in setting up this new office on advanced missiles.

However, when you get down to it, if you separate these fellows completely from the military service, my feeling is if they went on into manufacturing and things of this type, it is very doubtful to me that this would turn out a missile system that could be used by the services.

The services have to be considered in this thing very definitely as to the methods of deployment. They are the experts on how to conduct war, and they are the experts on how to take these systems and put them into their operation.

I get, therefore, to the place of thinking that research and development can be carried on to a great extent separated from the services, but when you start to move into finishing up the system, get into production, fitting together the missile and ground-support equipment and the methods of training and so on, this has to be integrated with the services.

Now, each service does not necessarily have to develop a family of missiles for itself. In certain cases, they become specific requirements for that particular service. We are attempting in our work now to make missiles which can be used over a greater range, and, if it is developed by one service, this does not necessarily narrow it down to being used by another one.

The Jupiter, as we are going ahead with it, is developed by the Army, is going to be manufactured by the Army and is going to be deployed by the Air Force.

We have other missiles that are coming along in research and development and we have more than 1 service following the research and development to make it applicable to more than 1 service's use.

For instance, the Polaris missile, which is being developed primarily for the Navy, is being considered for use by one of the other services as an IRBM missile.

Mr. answer was quite long, and I apologize for using so much of your time.

Senator BUSH. That is all right. I have plenty of time. That is just exactly what I wanted to get. Thus, there would be no advantage, in your view, then, at this time to attempt a unification of the administration of the missile business straight down the line.

In other words, the supervision which you and your organization are in a position to supply, the supervision and unification of purpose which you can supply, would seem at the present time, having gone as far as we have on the other line, that our most economical and most effective course would be to continue that form of organization.

Mr. HOLADAY. For the immediate future, yes, with some modifications which will be indicated as our experience improves, such as I indicated to you. This new Agency will do a certain amount of research and development in a unified manner.

FUNDING OF THE MISSILE PROGRAM

Senator BUSH. Mr. Holaday, we had some testimony here at the first session, during the first set of hearings that this committee held, showing the amounts that had been spent over a period of years on the missile program, and, if I recall it correctly, they ended up with an item of \$4¼ billion, which was the amount expended in fiscal 1957, ended last June 30, and projected \$4.6 billion for the current fiscal year, and then we have since seen that the President has recommended to the Congress that it consider on top of that an additional \$2 billion, which, I presume, a large part of that would go into fiscal 1958, the current year.

Mr. HOLADAY. Yes, sir.

Senator BUSH. Which might make that year have some \$6.6 billion available. This is a tremendous sum of money. From this, I hesitate to conclude that we are starving the program or that we take a stingy attitude toward it. Would you care to comment on whether you think that additional \$2 billion suggested by the President is a reasonable one at this time, or have you given any thought to the actual amounts by which this program ought to be increased?

Mr. HOLADAY. Yes, sir; I agree that this is a reasonable amount, because it happens to be one of the numbers I started using quite some time ago myself.

Senator BUSH. So, you fully concur in the recommendation that the Congress consider that additional amount of money, an additional \$2 billion?

Mr. HOLADAY. Yes, sir.

Senator BUSH. On top of the \$4.6 billion already available in 1956 fiscal year.

Mr. Chairman, I will yield the floor.

Senator JOHNSON. Senator Symington, I am sorry that we have run over our time limit, and I am the worst offender, but, if you will indulge us, we will make it up tomorrow and work it out where we alternate questioning.

Senator SYMINGTON. Mr. Chairman, I thank the Chair for his courtesy, but am satisfied. There are two points I would like to bring up that the distinguished Senator from Connecticut mentioned.

First was my understanding, from what the Senator said, that Mr. Dulles may have some ideas as to who is responsible for some of these leaks. If that is true, I suggest Mr. Dulles be received by the committee in executive session, give his opinions, and that then it might be pursued by some of the other agencies in Government.

Senator JOHNSON. I thank the Senator, and we will give consideration to it, although I want to get through with this investigation before I start one on the Senators.

Senator SYMINGTON. The agency that might pursue that is not particularly interested in this particular investigation.

Senator JOHNSON. I thank the Senator.

Senator SYMINGTON. I thank the Chair. The second point the Senator from Connecticut mentioned was possible further unification.

I admire Secretary McElroy for his courage in taking this position. I believe his chances of success are comparable to the chances of those who preceded him, because of the nature of the current organization in the Pentagon.

I also believe the Congress is not blameless with respect to the setup, because of the stipulations and restrictions in the National Security Act of 1947, as amended.

Mr. Secretary, with respect to the Secretary of the Navy, does he report to you on missiles?

SECRETARIES REPORT TO HIM

Mr. HOLADAY. Yes, sir; I would say that, in connection with the missile program, the Secretary of the Navy comes to me with his program. We have approved authority of the program within the Navy dealing with missiles.

Senator SYMINGTON. And the Secretary of the Army. He reports to you on missiles?

Mr. HOLADAY. Yes, sir.

Senator SYMINGTON. And the Secretary of the Air Force. He reports to you on missiles?

Mr. HOLADAY. On missiles.

Senator SYMINGTON. Do you consider this latest action of the Air Force within your normal responsibilities?

Mr. HOLADAY. Which action, Senator?

Senator SYMINGTON. I refer to an article, the Astronautics Agency, set up despite requests for delay.

Mr. HOLADAY. No, sir; this is primarily Secretary Quarles.

Senator SYMINGTON. So, your remark about the Air Force trying to shove itself into the limelight was outside of the responsibilities of your Department; is that right?

Mr. HOLADAY. Yes, sir.

Senator SYMINGTON. You were just giving your comments?

Mr. HOLADAY. That is right.

Senator SYMINGTON. Do you think coming up here and discussing the matter in that way is beneficial to unification of the services?

Mr. HOLADAY. This of course is out of my particular realm that I am an expert on. I will again have to give you my views on it.

Senator SYMINGTON. But you commented on it, did you not?

Mr. HOLADAY. Yes, I commented on it here and I want to comment on it to you in answer to your question here.

What turns out sometimes to be perfectly good plans and you look like you are moving forward all right turn around and trip you, I will have to admit, when too much of it gets aired before the final plans are well defined.

Senator SYMINGTON. Do you know Secretary Douglas?

Mr. HOLADAY. Yes, sir.

Senator SYMINGTON. You have respect for him, have you not?

Mr. HOLADAY. I certainly do.

Senator SYMINGTON. You know him well enough to know he would not deliberately do a thing of this character, do you not?

Mr. HOLADAY. Yes, sir.

Senator SYMINGTON. Then how do you think if he is the boss of the Air Force the Air Force is trying to shove it into the limelight? Would you file a statement at this point as to just what the facts are in this situation?

Mr. HOLADAY. The facts normally would not come to me, sir.

Senator SYMINGTON. But you commented on it as an Assistant Secretary or Director of the Department of Defense.

Would you get the facts at this point from the Secretary of the Air Force and file them?

Mr. HOLADAY. Yes, sir.

(The requested information is contained in an Air Force memorandum dated December 23, 1957, signed by James H. Douglas, as follows:)

DEPARTMENT OF THE AIR FORCE,
OFFICE OF THE SECRETARY,
Washington, D. C., December 23, 1957.

Memorandum for Director of Guided Missiles, OSD.

Subject: Facts concerning establishment of Directorate of Astronautics, DCS/Development, Hq USAF.

The Senate Preparedness Investigating Subcommittee of the Committee on Armed Services during hearings December 13, 1957, on satellite and missile programs requested that the facts concerning establishment of a Directorate of Astronautics, DCS/Development, USAF, be obtained from the Secretary of the Air Force and furnished for the record (p. 1008).

In response to the oral request of Col. D. E. Williams, Office of the Director of Guided Missiles, OSD, the following facts are furnished:

To accomplish what was believed to be better staff organization in connection with problems involving research and development in space flight, the Deputy Chief of Staff, Development, decided on a reorganization of his staff to include a Directorate of Astronautics. Since this was an internal Air Force matter, it would not, as a matter of course, come to me for approval. I first learned of the proposal when a proposed press release announcing the establishment of this Directorate was brought to my attention.

Following a conversation with Secretary Quarles, I assured him that no action would be taken toward the establishment of a Directorate of Astronautics until we had opportunity to discuss the matter fully. I directed that no press release be made and thought I had made it clear that the Office would not be established. Through a misunderstanding of my instructions, the Directorate was allowed to come into existence. When I learned the Directorate had been established, I directed the Chief of Staff on December 13 to dissolve the Directorate. This order was carried out on the same date.

JAMES H. DOUGLAS.

DIRECTIVE DOES NOT STATE REQUIREMENT OF REPORTING TO HIM

Senator SYMINGTON. Mr. Secretary, I believe you stated in missiles the Secretary of the Army, Navy, and Air Force report to you.

Have you a directive clarifying that situation, so it is clear they do report to you on missiles?

Mr. HOLADAY. The only directive I have is the one which was read by counsel this morning.

Senator SYMINGTON. And does that state that the three services report to you on their missile pictures?

Does it state that in the directorate?

Mr. HOLADAY. No, sir.

Senator SYMINGTON. Don't you think there must be some question, inasmuch as roles and missions are pretty well regulated in the National Security Act, as to just what your authority is?

Might it not be a good idea to have it clarified in a directive from the Secretary of Defense to you?

I will withdraw that question if it is to take time because I don't want to run over my time and I have several other questions. Could you file a statement for the record on that?

Mr. HOLADAY. Thank you.

(Department of Defense Directive No. 5105.10 dated November 15, 1957, follows:)

November 15, 1957
No. 5105.10

DEPARTMENT OF DEFENSE DIRECTIVE

Subject: Director of Guided Missiles.

I. PURPOSE

The purpose of this directive is to provide for the authoritative direction of all activities in the field of guided missiles.

II. RESPONSIBILITY AND AUTHORITY

In accordance with provisions of subsection 202 (f) of the National Security Act of 1947, as amended, and section 5 of Reorganization Plan No. 6 of 1953, there is established the Office of Director of Guided Missiles. The Director of Guided Missiles will direct all activities in the Department of Defense relating to research, development, engineering, production, and procurement of guided missiles.

III. RELATIONSHIPS AND ORGANIZATION

A. The Director of Guided Missiles will report directly to the Secretary of Defense.

B. The Director of Guided Missiles will utilize existing staff organizations within the Office of the Secretary of Defense including appropriate staff members of the Assistant Secretaries of Defense for Research and Engineering, Properties and Installations, Supply and Logistics, Comptroller, and the military departments, insofar as they may be necessary to carry out his assigned functions.

C. The Director of Guided Missiles is authorized such personnel and staff support as may be required for the performance of his duties and as may be approved by the Secretary of Defense.

IV. REPORTS

A. The Director of Guided Missiles may require such information and reports from agencies of the Office of the Secretary of Defense and of the military departments as may be required for the performance of his duties.

B. The Director of Guided Missiles will make regular periodic reports to the Secretary of Defense and will be responsible for the preparation of such reports as may be required of the Department of Defense with regard to guided missiles by the President and the National Security Council.

V. SUPERSEDURE

All directives, instructions, and memorandums or parts thereof to the extent they are inconsistent with the provisions of this directive are modified accordingly or rescinded, as appropriate.

NEIL McELROY,
Secretary of Defense.

Senator SYMINGTON. I believe you said in 1950 a due date on the Atlas was given as of 1965; is that right?

Mr. HOLADAY. Yes; we estimated, to the best of my knowledge, that the date was 1965.

Senator SYMINGTON. That was given in 1950.

Mr. WAGGONER. About 1950, Senator.

Senator SYMINGTON. Would you repeat your name, please?

Mr. WAGGONER. Alvin Waggoner. The statement which I made was that in the early 1950's—

Senator SYMINGTON. No; you said 1950, did you not?

Mr. WAGGONER. No, sir; I did not.

Senator SYMINGTON. Thank you. I asked the counsel, and he felt you did.

Mr. WAGGONER. No, sir; I said in the early 1950's. I believe the record will show that.

Senator SYMINGTON. Would you care to give the year?

Mr. WAGGONER. I would have to check the year, sir.

Senator SYMINGTON. Will you check that, and supply it for the record?

Mr. WAGGONER. Yes, sir; I will.

(In a Department of Defense memorandum filed subsequently with the subcommittee, it was reported that, in 1953, the Atlas availability was predicted to be not earlier than 1965.)

Senator SYMINGTON. And the statement was?

Mr. WAGGONER. That in the early 1950's—this is back in the Research and Development Board days—the estimate of the Atlas availability was about 1965. This was based on the best technical estimates that we had at that time.

Senator SYMINGTON. What was your position at that time in the Department of Defense.

Mr. WAGGONER. I was the Deputy Executive Director of the Committee on Guided Missiles of the Research and Development Board.

Senator SYMINGTON. Would you have some paper you could put in the record at this time which would justify your making that statement?

Mr. WAGGONER. Yes, sir.

Senator SYMINGTON. Do you know what report was made at that time?

Mr. WAGGONER. At that time there were a series of documents in which we showed all of the estimated availability dates of the guided missiles, of all guided missiles. The date that I am referring to is the date that, unless my memory fails me, is carried in that, and I will be glad to supply that page for the record.

[The information requested of Mr. Waggoner is included in the classified records of the subcommittee.]

Senator SYMINGTON. When was the ballistic-missile program reactivated; do you know?

Mr. WAGGONER. The ballistic-missile program was essentially re-activated in early 1951.

Senator SYMINGTON. In early 1951. At that time, what was the date, the estimate of the ICBM?

Mr. WAGGONER. The only date that I have, Senator, is the one that I gave, so I will have to furnish that one for the record. The date did not change, as far as I recall, until the program was re-oriented in 1953 or 1954.

Senator SYMINGTON. In 1953 or 1954; thank you.

“THE MAZE OF MISSILE MANAGEMENT”

Now Mr. Director, have you seen a chart called The Maze of Missile Management that was in Life magazine, inserted by Mr. Trevor Gardner?

Mr. HOLADAY. Yes, sir.

Senator SYMINGTON. In that chart, I believe he has 95 boxes of various responsibilities and authorities. Has that chart been changed recently?

Mr. HOLADAY. Yes, sir. There certainly has been some modifications in that chart.

Senator SYMINGTON. What is the modification you consider the most important in the effort to streamline and locate authority and responsibility?

Mr. HOLADAY. This is the concentrating of authority and responsibility in the Department of Defense.

Senator SYMINGTON. The Department of Defense has always run it, hasn't it?

Mr. HOLADAY. Yes, sir.

Senator SYMINGTON. Where is the concentration? Do you mean putting you over the three service Secretaries, so that they all report to you on missiles?

Mr. HOLADAY. No; putting the program all in one office, instead having it divided as it was previously—part in the office of the special assistant to the Secretary and part in research and engineering.

Senator SYMINGTON. Mr. Gardner had a chart—I am talking from the standpoint of structure and function organizationally—in which there is a director of missiles space development; another chart. Do you remember that chart?

Mr. HOLADAY. No.

Senator SYMINGTON. It was also in Life magazine.

Mr. HOLADAY. I recollect looking at it, but I cannot remember it well enough.

Senator SYMINGTON. In this chart the Director of Missiles Space Development bypasses the Secretary of the Army, the Secretary of the Air Force and the Secretary of the Navy, and goes directly to the ballistic missile units, the Ballistic Missile Division of the Air Force, the Army Ballistic Missile Agency, and the project Vanguard.

Is your job of that character, or do you go through the Secretaries of the services?

Mr. HOLADAY. I go through the Secretaries of the services.

Senator SYMINGTON. And do you discuss this regularly with them and give them instructions as to how they shall handle their missile programs?

Mr. HOLADAY. Yes, sir; I develop it through all three of the Secretaries.

Senator SYMINGTON. When was the last time you had a meeting?

Mr. HOLADAY. The last time was on a 2-day trip with both the Secretary of the Air Force and the Secretary of the Army which was last Tuesday and Wednesday.

The Secretary of the Air Force and I plan a trip on Monday to California. This is all in the area of ballistic missiles.

Senator SYMINGTON. When was the last time you talked with the Secretary of the Navy?

Mr. HOLADAY. My last conversation with the Secretary of the Navy was in Secretary McElroy's office just before he left to go to Paris.

HE REPORTS TO THE DEPUTY SECRETARY

Senator SYMINGTON. When the Unification Act was formed, instead of calling the second man Under Secretary of Defense, in order to make him as much as possible an alter ego of the Secretary of Defense, he was called Deputy Secretary of Defense?

Mr. HOLADAY. Yes, sir.

Senator SYMINGTON. Do you report to Secretary Quarles also?

Mr. HOLADAY. My charter says that I report to the Secretary of Defense.

Senator SYMINGTON. Where does that leave the Deputy Secretary of Defense?

Mr. HOLADAY. When the Secretary is out, then the Deputy Secretary becomes the Secretary. In most cases I believe all conversations that I have had with the Secretary of Defense, the Deputy has been present.

Senator SYMINGTON. But if the Secretary is in town, you bypass the Deputy Secretary and report directly to the Secretary on Missiles, is that correct?

Mr. HOLADAY. Yes, sir.

Senator SYMINGTON. Where do the Assistant Secretaries of Missiles of the services, research and development, where do they come into the picture?

Mr. HOLADAY. They are in each one of the services, and my work is with them directly.

Senator SYMINGTON. It cannot be direct if they report to the Secretary of the services; can it?

Mr. HOLADAY. That is right.

Senator SYMINGTON. How do you work that out?

I am talking about day-to-day operation.

Mr. HOLADAY. In day-by-day operation, as we do in some of the areas here, if it is mostly research, the meeting would probably be with them or, as we have in certain areas, we have groups which have those three fellows on them, and they come in and we meet as a group.

Senator SYMINGTON. What would happen if the administration of the program did not suit you?

What do you do in that case?

In other words, as I understand it, you say you have direction of the program, but not administration.

Mr. HOLADAY. That is correct, sir.

Senator SYMINGTON. Is that correct?

Mr. HOLADAY. That is right.

Now it is perfectly proper, and I discuss problems with them, point out my views if this does not resolve the problem I take action to see that it is resolved in the best interests.

Senator SYMINGTON. And how would you do that?

Mr. HOLADAY. If we cannot resolve it in discussions amongst ourselves, I go ahead after discussing it with the Secretary of Defense, and establish a directive indicating which way the program will go.

THOR UNITED STATES JUPITER—"PLAYING IT SAFE"

Senator SYMINGTON. One final thought, or question.

On the Thor and the Jupiter situation, as late as the end of October there was going to be a decision for one.

Mr. HOLADAY. Yes, sir.

Senator SYMINGTON. I want to emphasize I believe it may very well be right to have two. In that connection do you believe that one of these units is the better?

What is your thinking?

As I understand it, it was your decision in this matter?

Mr. HOLADAY. I am not in a position to say whether one is better than the other. I was playing it safe as insurance to give us the assurance of the early availability of an adequate number of missiles.

Senator SYMINGTON. And if you are going to make two, you will have to spend more money in tooling, programing, and so forth, than you would if you were only going to make one. Is that correct?

Mr. HOLADAY. We will have to put more money into the program in ordering more materials, sir.

The extra cost will probably be that which would be a continuation of two R. and D. programs instead of R. and D. program.

Senator SYMINGTON. I understand.

Where are you going to get the money?

Are you coming to the Congress for the program?

Mr. HOLADAY. Yes, sir.

Senator SYMINGTON. Are you proceeding on the assumption the Congress will give you the money?

Mr. HOLADAY. Yes, sir.

Senator SYMINGTON. How much money will you spend roughly, before you appear and ask for more?

Mr. HOLADAY. I would have to give you a guess, and I am not very good at guessing in these matters, but we are not going to spend many millions of dollars.

Senator SYMINGTON. You are not going to spend many millions?

Mr. HOLADAY. No, sir.

Senator SYMINGTON. Five million or ten million?

Mr. HOLADAY. I can't answer precisely, but that is about the right order of magnitude since ABMA is spending about \$15 million per month for Jupiter.

Senator SYMINGTON. Could you find out what the information is, and put it at this point in the record, as to exactly what the additional cost will be in building the two, where the money will come from, and how it is to be presented to the Congress?

Mr. HOLADAY. Yes, sir.

(The requested information is presented as follows:)

THOR-JUPITER COSTS

Current estimates indicate that the cost of completing the currently scheduled production programs for both the Thor and Jupiter missiles would be in the order of \$150 to \$200 million above the cost of completing only one program. A detailed study is now underway to make precise determination of these costs.

Funds for the Thor development program were included in the Air Force fiscal year 1958 budget. The Jupiter program is being financed in part from the Department of Defense emergency fund and in part by reprogramming available procurement funds.

The additional funds required to place both the Thor and Jupiter missiles on an accelerated production basis will be set forth in the fiscal year 1959 budget and in a supplemental appropriation request for fiscal year 1958 to be submitted to the Congress by the President early in January 1958. Pending congressional action on the supplemental appropriation request, Jupiter production can be funded by reprogramming currently unobligated funds.

Senator SYMINGTON. One final point about the overtime situation brought up by the Chair.

It is true, is it not, that there is no restriction of any kind on overtime on missile testing, is that right?

Mr. HOLADAY. That is right.

NO RESTRICTION ON OVERTIME IN BALLISTIC MISSILE WORK

Senator SYMINGTON. There is a restriction, however, on overtime in the corporations that produce defense products including missiles. Is that right?

Mr. HOLADAY. In the ballistic missile area there is no restriction on overtime in the corporations for the production of ballistic missiles.

Senator SYMINGTON. If a company was making engines for airplanes and engines for missiles, they must take their overall overtime. If they put it all in ballistic missiles they have no more overtime for production other than missiles. Is that correct?

Mr. HOLADAY. My interpretation is while they are working on ballistic missiles, they have no overtime restrictions.

There is an overtime restriction if they were working on a tank or if they were working on an airplane engine, things of this type.

Senator SYMINGTON. So your testimony is that there is no overall restriction on a corporation making missiles and other items.

Is that correct?

Mr. HOLADAY. That would be my interpretation, sir, because we have no restrictions in ballistic missiles.

Senator SYMINGTON. And you don't know beyond that point?

Mr. HOLADAY. Yes, sir.

Senator SYMINGTON. In the overtime field?

Mr. HOLADAY. Yes. I think there are other people that can give you a more expert answer because I am not an expert on what they are doing in all the other areas.

Senator SYMINGTON. Mr. Chairman, I have nothing further. I notice a press statement just presented to me on something I asked questions about.

I would ask the Chair to read it to clarify the position of Secretary Douglas; and I yield my time.

Senator SALTONSTALL. Clarify Secretary who?

Senator SYMINGTON. Clarify the position of Secretary Douglas.

Senator JOHNSON. I just want to observe that we have a news release, and I am glad to observe that he will make a decision even if

it is a decision to revoke a decision that they made prematurely. This is a press release dated December 13:

The Secretary of the Air Force today suspended the order creating a Directorate of Astronautics in the Air Force under the Deputy Chief of Staff, Development.

He stated that this order was issued prematurely since the purpose of the new agency will be to serve as an Air Force contact with the proposed Advanced Research Projects Agency of the Department of Defense, which has been announced by the Secretary of Defense but not yet brought into being.

Secretary Douglas explained that the action creating the Directorate in the Air Force was the result of a misunderstanding and contrary to assurances he had given the Secretary of Defense that no such action would be taken until it could be coordinated with the specific plans for the new Agency in the Department of Defense.

That is for the information of the committee members and the staff, and I am sorry that the decision was premature.

I regret the misunderstanding exists, but it seems to me here is a good deal of frustration over there in the Defense Department and I hope, Mr. Holaday, as missile boss you get it straightened out and get some decisions made and some that won't have to be revoked 24 hours later.

Senator SYMINGTON. Mr. Chairman, may I ask one more question?

Senator JOHNSON. Senator Symington.

Senator SYMINGTON. Mr. Director, would you give the committee an analysis of the overtime decision incident to the entire missile picture?

I want to be sure I understand. Therefore, when you give the committee a breakdown of overtime with respect to missiles, specifically with respect to such directives as 4105.48 and 4105.8, would you put the dates any changes were made; in other words, the date the new directive with respect to overtime applied. Please have somebody in the Department, so that we could have it all packaged, as of December 13 include other Defense products produced by companies which also make missiles.

Would you do that?

Mr. HOLADAY. Yes. When do you want us to start this?

Senator SYMINGTON. I would start October 4, 1957.

Mr. HOLADAY. Thank you.

(The information requested of Mr. Holaday is included in the classified records of the subcommittee.)

Senator JOHNSON. What do you define as "overtime?"

Senator SYMINGTON. That percentage, Mr. Chairman, of allowable pay to labor above normal agreed-upon hourly pay. I would not define overtime, for example, as excessive hours worked by monthly people, say engineers or supervisors.

Senator JOHNSON. That is very good.

Any other questions of Mr. Holaday?

Senator SALTONSTALL. Mr. Chairman.

Senator JOHNSON. Senator Saltonstall.

ASSERTS PRESENT AUTHORITY SUFFICIENT

Senator SALTONSTALL. Mr. Chairman, I would like to ask just two questions.

Mr. Holaday, are you satisfied with your present authority as given to you by the directive of Mr. McElroy?

Mr. HOLADAY. Sir, I am finding no difficulty to carry out my job with the authority that is granted to me in this directive.

Senator SALTONSTALL. And that will give you all the authority, all the power and all the directive control that you need?

Mr. HOLADAY. Yes, sir. It partly is responsive to the directive. The other one is the very close working relationship that I have with the Secretary, and that I do not have to call up for an appointment. If I have a problem, I go right up and walk right into his office with my problem, and this relationship is making it possible for me to move the work along efficiently.

Senator SALTONSTALL. Just one other question.

It is always easy to try to solve the problem by appointing new groups or committees. We all know that in any line of work that we do.

Is it your intention to go just as slow as you can with instigating or approving new groups of committees without seeing if the present setup cannot do the job?

Mr. HOLADAY. Yes, sir. I would say it is probably more in this direction of reducing the number of groups, and maybe strengthening some that I already have by getting better balance of membership on them.

But my move would be to reduce the number rather than to add to at the present time, as I see it, sir.

Senator SALTONSTALL. It seems to me in listening to you today, there were too many committees, too many advisory committees.

My second comment is the one I have already made to you, that I hope you and Mr. McElroy will give awfully thoughtful consideration before you set up a new group on this space-satellite business as opposed to the responsibilities that you now have on the ballistic missile program.

Mr. HOLADAY. Thank you.

Senator SALTONSTALL. That is a comment, not a question, unless you want to answer it.

Mr. HOLADAY. No, sir.

Senator JOHNSON. Any other questions?

Senator STENNIS. No questions.

Senator JOHNSON. Senator Carroll, we are delighted to have you with us. Do you have any questions you would like to ask?

Senator CARROLL. Mr. Chairman, just a few very short questions.

Senator Flanders questioned Mr. Holaday, and your response to it was not quite clear to me.

You are coming to the Congress and asking for substantial sums of money. Will the carriages, the launching instruments that launch missiles, be adequate for launching space satellites? I think your answer was "partly, yes."

Can you be more specific?

Mr. HOLADAY. We would have to do considerably more engineering to provide for this. This would probably call for some facilities in the research and development category and not necessarily in the production category.

Senator CARROLL. That is as I understand it—Dr. Hagen testified before this committee not long ago, and I understand through a directive by the Executive he was in a sense given supervision over the satellite program. That is true, is it not?

Mr. HOLADAY. Yes. He has the technical part of the satellite.

Senator CARROLL. Does he operate under your jurisdiction?

Mr. HOLADAY. The Vanguard program is under our direction, yes, sir.

Senator CARROLL. Were you then in your present position in the Department of Defense, in May of this year, June of this year?

Mr. HOLADAY. The Vanguard was put into our area, I don't remember the exact date, it was April, May, or someplace in there.

Senator CARROLL. You were in your present position as that time?

Mr. HOLADAY. I was an assistant to the Secretary of Defense at that time.

Senator CARROLL. One thing, Mr. Chairman, that struck me from this testimony was that, as I recall Dr. Hagen's testimony, and I offered a newspaper article in evidence at the time, there was a 24-page report submitted by the Rand Corp. of Santa Monica to the Air Force in June.

Was that brought to your attention, on the missile program?

Mr. HOLADAY. Just on that broad definition——

Senator CARROLL. This program had to do with the Soviet Union. The prediction was that the Soviet Union would launch their satellite on the 17th.

The purpose of my question is this, Mr. Holaday: In considering the idea of a guided-missile program and the satellite program, almost every Senator has raised the question of the bottleneck in the passing on of scientific information. In this case, Dr. Hagen said he had never heard of it.

Here is a man who is in charge of the satellite program. This is information coming to the Air Force. I do not know whether it ever got to your office, but it seems to me to raise the important question and Senator after Senator has raised this question, How do we break the bottleneck? How do we pass on scientific information so the various agencies of the military will know, so even the people who have contracts will know?

It seems to me that this is very, very vital.

DISSEMINATION OF SCIENTIFIC INFORMATION BOTTLENECK

Mr. HOLADAY. I agree with you that we do have a bottleneck here, and that we have been working on it.

As I have pointed out before, I do not know what the real answer is and how to break through this. I do not know.

I do not know whether we have too many people, or too many restrictions, but certainly we are having trouble in talking to each other.

Senator CARROLL. You are impressed with this bottleneck that exists?

Mr. HOLADAY. Yes, sir.

Senator CARROLL. For example, in this report of Mr. Gardner—I say "report"—in this magazine article, he talks about how the management of scientific decision manages to escape out of the Pentagon-shaped jungle and into the laboratories.

This is one point he raises. He talks in this article—I do not know whether you have read it or not—about the Pentagon. He says 2,400 people under the Secretary of Defense, 500 people under the Joint

Chiefs of Staff. Under the Chief of Staff of the Air Force there are 8,000 people.

How you break it down is a tremendous job, how do you break it down and get the information flowing from one scientific group to another? That is why I come back again to this question:

You have a launching carriage that will launch the satellite; even though it is in the military, it may save us tremendous sums of money.

Mr. HOLADAY. Oh, yes, sir; I agree with you there.

Senator JOHNSON. Thank you very much.

Any other questions? Senator Saltonstall? Counsel?

Mr. Holaday, in response to Senator Saltonstall's question, you said you felt that you had all the authority that you needed to carry out your job, your assignment.

I hope that is correct; but I also hope that you have all the authority you need to build us a missile. That is what I am interested in.

I do not know whether your job is such that you can build some missiles or not, but do you feel in your own heart that you have all the authority you need to get the job done?

Mr. HOLADAY. Yes, sir.

Senator JOHNSON. Get the missiles built?

Mr. HOLADAY. Yes, sir. This, as I have pointed out, is very important in my own personal considerations. I do not want to run down research and development. We have to have research and development to get missiles.

But when we have completed our research and development, the next thing is to get on with the job of making some missiles, and my No. 1 priority at this time is to get some missiles made.

Senator JOHNSON. Mr. Holaday, the committee wants to thank you for your testimony. I think it is very apparent to all of us that you are a patriotic man trying to do a very difficult job under extremely trying circumstances. We hope we have not added to them.

I confess I am still somewhat confused as to the extent of your authority. We hope that can be cleared up in the days ahead; and we hope that we can get the missiles built.

We will excuse the witness for the present.

Mr. Holaday, we will call you back in executive session at some appropriate time that we can agree upon. In the meantime, I hope you will go back to the Pentagon after a good night's rest and get started building us some missiles tomorrow.

Mr. HOLADAY. Thank you, sir.

Senator JOHNSON. I talked too long. Counsel has a question.

Mr. WEISL. Senator Symington is not here, but I would like the record to show, in justice to Mr. Holaday, who has to live with the Air Force and the other branches of the military service, that he did not volunteer anything about this order that the Air Force issued, or use the term "beating the gun." He responded to a question in that respect.

Mr. HOLADAY. Thank you. That is very nice of you.

Mr. WEISL. I also want the record to show that Mr. Holaday, General Betts, and Mr. Waggoner completely cooperated with counsel in the previous interviews that we had, and held nothing back.

Senator JOHNSON. If counsel is referring to my question, it should not read "beating the gun." We call it "jumping the gun."

You are excused, Mr. Holaday.

The committee will take a 5-minute recess while we get this gun situation straightened out.

(Short recess.)

Senator JOHNSON. The committee will come to order.

Our next witness is the Secretary of the Army, Mr. Brucker.

Mr. Brucker, with you we begin to question the various services who have the direct responsibility for producing individual missiles.

A great deal of comment has centered around this point. There seems to be a feeling that each service has a case which must be made to the public. The public, of course, is interested only in the case that could be made for the security of the Nation.

We are going to hear you and the expert members of your staff. We hope that they will tell us how we can get better missiles faster. We are not interested in detailed explanations of why something has not been done, cannot be done. We want to know, if we can, how to do it and how you propose to do it.

To save time, Mr. Secretary, at this late hour, I am putting your biography into the record.

(Secretary Brucker's biographical statement follows:)

WILBER M. BRUCKER, SECRETARY OF THE ARMY

Wilber M. Brucker, former Governor of Michigan, was sworn into office as Secretary of the Army July 21, 1955, following his nomination by President Eisenhower on June 22 and confirmation by the Senate on July 11. He had served as General Counsel of the Department of Defense from April 23, 1954, until he assumed his new office.

Secretary Brucker has a background of Army experience extending back to enlistment in the Michigan National Guard in 1915 and service on the Mexican border as a member of the 33d Infantry, Michigan National Guard, in 1916 and 1917. During World War I he served in France with the 166th Infantry, 42d (Rainbow) Division, in all the division's engagements including Chateau Thierry St. Mihiel, and the Meuse-Argonne. Cited by General Headquarters, AEF, for bravery under fire, he was awarded the Silver Star. He was discharged as a first lieutenant June 5, 1919.

Secretary Brucker was graduated from the University of Michigan in 1916 with a bachelor of laws degree. He was assistant prosecuting attorney for Saginaw County, Mich., from 1919 to 1923; prosecuting attorney from 1923 to 1927, and assistant attorney general of Michigan until he became attorney general February 18, 1928. On November 5, 1930, he was elected Governor of the State of Michigan and served until 1933. Thereafter, to the date of his appointment as General Counsel of the Department of Defense he was a practicing lawyer with the law firm of Clark, Klein, Brucker, & Waples of Detroit, Mich. He is a member of the Michigan State, Federal, and American Bar Association; the American Legion, and Veterans of Foreign Wars. He is a past national president of the 42d (Rainbow) Division Veterans.

Senator JOHNSON. Will you please stand and take the oath?

Do you solemnly swear that the testimony you give this committee will be the whole truth and nothing but the truth?

Secretary BRUCKER. I do.

Senator JOHNSON. General Taylor, do you solemnly swear the testimony you give this committee will be the whole truth and nothing but the truth?

General TAYLOR. I do.

Senator JOHNSON. General Taylor, we appreciate very much your coming here, and we understand the circumstances under which you appear, and we will try to be as considerate as possible. It is typical of you to want to do your duty in any circumstance, and we are grateful to you.

We are glad that this country has a man like you.
General TAYLOR. Thank you.

**STATEMENT OF HON. WILBER M. BRUCKER, SECRETARY OF THE
ARMY**

Senator JOHNSON. Mr. Secretary, if you will proceed with your prepared statement, then we will have counsel begin his examination.

Secretary BRUCKER. Mr. Chairman and gentlemen of the committee, I have a short statement, and I would like to read it.

You are inquiring into a vital aspect of our national security. I feel that these hearings have already done a great service for our country in demonstrating the urgency of national defense.

Senator JOHNSON. Do you appear as Secretary of the Army, Mr. Secretary, or the Acting Secretary of Defense?

Secretary BRUCKER. At this moment, I am Acting Secretary of Defense.

Senator JOHNSON. Congratulations. Down in Texas when we have an Acting Governor, he takes a lot of action sometimes. Maybe we can get some action out of you on some of these missiles the Army has been talking about.

Proceed.

Secretary BRUCKER. That is what some of my associates are fearing.

From past experience, once the American people become thoroughly aroused, the rest of the job will become less difficult.

In view of our international commitments and Soviet advances and improvements throughout its military structure, the Army has felt very keenly the urgency of modernizing its entire program, organization, weapons and weapons system, to build an effective deterrent in this nuclear missile age.

During the last few years much progress has been made. The Army has reorganized along pentomic lines with its new divisions equipped with atomic rockets and effectively supported by a larger missile family available at corps and army level.

The missile has become a key supporting weapon of the modern army. Without missiles, the Army would not be effective on the atomic battlefield and would be unable to execute its mission of defeating the enemy ground forces.

The importance of missiles, both surface-to-surface and surface-to-air, has been clear to the Army since the end of World War II. We have had research-and-development programs underway since that time. We have had both types of missiles in operational deployment for several years.

In the development of the longer range missiles the Army has from the beginning emphasized the necessity for the ground mobility of the missile and its launching equipment. The Army believes that missiles must be mobile in order to survive initial enemy attacks and continue to move and fire so that they will be able to accomplish their combat or retaliatory mission.

Mobile Army missile units can be emplaced in a multitude of firing positions throughout entire land areas. Missiles emplaced in remote mountains, jungles, and forest areas would be difficult to find and hard to destroy.

These here-today-gone-tomorrow units would pose an insoluble problem for the enemies' intelligence and reconnaissance services. Mobile missile units can be completely separated from population centers and other critical military installations.

It is especially important to note that the Army already has in its structure the mobile maintenance, medical, communication, supply, Engineer survey, and construction units which are absolutely essential for the support of remotely dispersed, fast-moving, missile operations.

ARMY WENT "ALL OUT" ON JUPITER PROGRAM

One of the Nation's top priority programs has been the development of the Army's Jupiter intermediate-range ballistic missile. Started late in 1955, the objective of this program has been to provide, at the earliest possible date, an operational 1,500-mile ballistic-missile capability.

The Army gave the Jupiter program the highest priority. Special organization and streamlined procedures were instituted to provide the fastest possible means for producing this important weapon.

The progress made during the last two years has been an outstanding technological feat for which the Army is justly proud. Never before has so much been accomplished within such a short time on a complex new weapons system. I weigh my words when I say that.

The recent decision by the Secretary of Defense to authorize production of the Jupiter IRBM is based on the success of this program. It is remarkable that such a decision could be made after such a short period of development. The operational deployment of intermediate-range ballistic missiles by the United States and our allies will be a strong and major deterrent to any would-be aggressor.

The Army believes that in the missile era another major part of our deterrent strength will be the awareness by the Soviets that any attack launched against us will meet with certain defeat.

For this reason, the Army considers that the development of an anti-intercontinental ballistic missile, sometimes referred to as the anti-ICBM or the antimissile missile, should be pursued with the utmost urgency. The vital necessity of providing an effective defense of our homeland needs no elaboration.

The Army has put an intense effort into Nike-Zeus, an anti-ICBM missile. This project was started several years ago by the Army when our basic development of Nike-Hercules became an assured success.

An 18-month feasibility study by some of the most highly experienced scientists in the missile field convinced us that a defense against the ICBM was both technically and economically feasible.

After more than a year's effort on experimental work, we are now in the stage of component development, a necessary preliminary to full-system development.

Senator SALTONSTALL. Mr. Chairman, might I interrupt there?

Senator JOHNSON. Senator Saltonstall.

NIKE-AJAX FIRST IN THE FAMILY

Senator SALTONSTALL. Mr. Brucker, if it would not inconvenience you, could you give us a brief description at this point of the differ-

ence between the Nike-Hercules and the Nike-Zeus, and perhaps the background of the 3 or 4 Nike's?

Secretary BRUCKER. I would be very glad to comply.

They are all a part of what we call the Nike family. The first was the Nike-Ajax, which was developed, of course, several years ago, and came into production and is ringed around the cities and industries and the towns of the country, with which the people are well informed.

The next development of that was the Nike-Hercules. That might be called the second-generation Nike, and that, of course, without dealing with security matters in detail, improves very greatly the Nike family's reach, height, and lethality, and other elements that I might mention in terms of generality.

Now, the third generation or the third step in the Nike family is the Nike-Zeus, which is the antimissile missile or the anti-ICBM, as it is sometimes called. That is an extension beyond the Hercules out a great deal further in the area of incoming missiles.

And I may say to you, Senator, that the general characteristics of that are such a magnification and such an expansion of the same Nike-Hercules concept that it will do the job we are ready to do.

Shall I proceed?

Senator SALTONSTALL. Thank you.

Secretary BRUCKER. Motivated by the urgency for a ballistic-missile defense for the United States, and our success to date, we have made a study of how we could accelerate the Nike-Zeus program. On the basis of these studies, we feel that Nike-Zeus will provide this country with a defense against the ICBM. We have made great strides in the fields of IRBM's and anti-ICBM weapons systems.

The Soviet's recent satellite successes have emphasized the importance of conquering the problems of outer space. It is imperative that we now demonstrate to the free world our capabilities in the field of satellites and space vehicles. We must undertake a military, as well as a scientific, program that will accomplish far-reaching scientific advances into space.

The Army has a unique capability to make significant and early contributions in this conquest of space. It has not only the ability with existing equipment to begin launching small satellites almost immediately, but it has an incomparable reservoir of experience in rockets, guided missiles, ballistic missiles, and space vehicles.

Two outstanding Army organizations in these fields are Dr. von Braun's team at the Army Ballistic Missile Agency at Huntsville, Ala., and Dr. Pickering's team at the Jet Propulsion Laboratory of the California Institute of Technology. Both of these teams have been doing outstanding pioneering work in the field of missiles and are highly competent in the space field. As you already know, the Army has been directed to launch a satellite early next year in support of the Vanguard program and the scientific objectives of the International Geophysical Year.

ARMY PROPOSES TO LAUNCH LARGER SATELLITES

Beyond this, the Army has proposed an integrated program for the development and launching of far larger satellites for scientific applications. We are ready, willing, and able to embark upon these and

other long-range programs with resources that augur well for success. These two Army scientific teams have the capacity and competence to undertake an ever-widening spectrum of projects, and I weigh my words when I say that.

Without in the least underestimating the threat of Soviet scientific achievement, another Soviet threat deserves attention at this time. It is the strong threat on the ground. No one who has read or heard about the November 7 Communist parade in Moscow could mistake the growing modernization of the Soviet ground army and its ability to fight a nuclear war. Our people should be sharply alerted to this threat. A nuclear stalemate becomes an ever-increasing possibility with the advent of nuclear plenty and more advanced technology. Certainly, neither nation will initiate a global nuclear exchange that would result in its own destruction. Limited war on the ground remains the most probable immediate threat to the security of this Nation and its allies. We must give at least as much attention to the forces we are likely to use as we give to those forces which we hope never to use. I urge accelerated efforts to meet this threat in all of its manifestations.

WELFARE AND SECURITY OF ALLIES CRITICAL QUESTION

The fact that Communist armies cannot reach our shores does not mean that those armies are not a threat to our survival. The United States has only 6 percent of the world's population, and depends upon outside sources for many of its strategic materials. It logically follows that our future and our fortunes are wrapped up in the welfare and security of our allies. It is precisely here that Army forces have a direct and unique function.

If we did not have Army forces deployed or quickly deployable at any threatened point along the Iron and Bamboo Curtains, the Communists could nibble away at the free world with impunity. We cannot withdraw to a Fortress America, cock our long-range missiles skyward, and abandon collective security. We cannot abandon, to the Communists, our allies with their vital lands, their industries, their scientific resources, and their desire to be free. It would be national suicide for this Nation to retract its forces to the confines of the North American Continent where they, together with our people and our industries, would constitute an extremely vulnerable target.

Enemy forces moving unopposed on the ground, particularly under cover of darkness, can remain dispersed and mingle almost indistinguishably with civilian and refugee populations, so that they are difficult to locate and nearly impossible to destroy. It is only when invading forces are opposed by Army forces on the ground that military targets take form and atomic firepower can become effective. This serves to illustrate the importance of the Army's role in a balanced, tridimensional force which is indispensable to victory.

The Army not only has a vital role now but, in my opinion, an increasingly important one in the future. I can only reemphasize that the kind of military conflict which is the most probable in our time is the kind of conflict in which Army forces would play a leading role.

Mr. Chairman, with this brief statement of general principles, the representatives of the Department of the Army, General Taylor and

others, are ready to answer your inquiries into the fields of missiles and satellites and related fields pertaining to the military strength of the United States.

Senator STENNIS (presiding). Mr. Secretary, we thank you. As always, you have made a good statement.

We will proceed right along now, gentlemen. I call on counsel to proceed with his questions.

Mr. WEISL. Mr. Secretary, in view of the fact that your very able staff, each of whom I have interviewed, will answer the details of what you have put in your fine statement, I don't believe I want to ask you any questions.

Senator STENNIS. Senator Saltonstall?

HISTORICAL ROLE OF ARMY IN BALLISTIC-MISSILE AREA

Senator SALTONSTALL. Mr. Brucker, you have overcome me, because you have overcome the counsel. Let me ask you just about 1 or 2 questions. Do you believe that the Army, which we all consider essential to the future defensive purposes of our country, has a fundamental part in developing a ballistic missile and a part in developing the ballistic-missile program?

Secretary BRUCKER. I most certainly do; emphatically so. As a matter of fact, the Army has been in this business for many years now. Growing out of our natural artillery mission that began with ground-to-ground fire and later developed in the missile field, the Army has attained the competence that, I think, without any effort at bragging or undue emphasis upon it, is really a great part of the deterrent strength of this country at this moment. So my answer is, "Yes; I do feel that the Army has that part."

Senator SALTONSTALL. Do you feel if it has that part; that it should restrict its research and development to ballistic missiles or guided missiles that will have a comparatively short range?

Secretary BRUCKER. On that, I would like to say this: I think that the Army and its missile arsenal should have this said with respect to our need and our requirements. We have, of course, the whole range in our arsenal of missiles at the present time, beginning with the Dart and running up to the Redstone, which, of course, is the 175- to 200-mile missile.

I feel that the development in this field has been so marked—particularly since we have seen the visual evidence of it, in addition to other intelligence information that we have received indicating that the Soviets have missiles in the range of the requirement that I am going to talk about now—that it is only logical that the Army should develop the capacity that it has for the requirement that we have. That is the midrange missile that goes beyond 200 miles. The midrange is not occupied by the IRBM, which is in the area of 1,200 to 1,500 miles, but is the range of 500 to 700 miles, which is the range that I shall denominate as the midrange. We are capable and competent to move into this range. Already the army that faces us has this missile. It was paraded by on November 7.

Senator SALTONSTALL. And that is a fundamental part, we will say, of the Army, in your opinion, of a strategic concept—

Secretary BRUCKER. It is.

Senator SALTONSTALL (continuing). Of an instrument that will fire that far?

Secretary BRUCKER. It is.

Senator SALTONSTALL. Now, let me ask you just two more questions. One, there is always a very great controversy as to whether the air defense of a city, tactical air defense of a city, which is now within the overall control of the Air Force, as I understand it, should be given to Nikes when the Air Force has its Tactical Air Force.

Secretary BRUCKER. Senator Saltonstall, may I just make a slight correction there? The Air Force does not have the operational control of the air defense from the ground. The Army has the firing of the ground-to-air Nike Ajax, Nike Hercules, and, of course, the Nike Zeus, when it comes.

And so, from that standpoint, of course, the Army is in its element in the fire from ground to air, which is an extension, of course, of the old antiaircraft with the guns, and now with the missiles.

UNIFIED COMMAND VESTED IN NO SINGLE SERVICE

Senator SALTONSTALL. What I am getting at is the overall command, the unified command in the defense of our country is in the Air Force, is it not?

Secretary BRUCKER. No. It is a unified command in which there is Army, Navy, and Air Force members, each of them members of that command. That overall command is located, as you know, in Colorado, but it is not an Air Force command alone. It is an Army, Navy, and Air Force command, in which, of course, all three participate. Now, all three have a mission in that field.

The Army's part of that mission is to fire the ground-to-air missiles from the defense positions that are stationed all over and around the United States and some other places in the world. There is a very clear defense doctrine that is stated in the November 26, 1956, directive, an enunciated and reconfirmed document.

Senator SALTONSTALL. Are you satisfied or are you critical of the new authority that has been given to Mr. Holaday by Secretary of Defense McElroy for the overall authority of developing the research programs and the development programs in ballistic missiles?

Secretary BRUCKER. We are not critical of the appointment of Mr. Holaday. As a matter of fact, we are working with him in close cooperation. We feel that having a person in authority at that juncture, or that place in the organization, is a step in the direction in which we can cooperate, cannot only live but can work. We are glad to have authority established whereby we, with others, can cooperate to that end.

Senator SALTONSTALL. You used the word throughout "cooperate."

By cooperating you mean that if he exercises that authority by changing we will say your research effort from one type of an instrument to another type of an instrument, and you do not wholly agree with that decision, that you still think, overall, that is a good thing?

THEY WANT THEIR DAY IN COURT

Secretary BRUCKER. Yes, I do. Now we have resort, if we have any question about it, to a method of hearing, and he accords us that hearing. If there is any further matter, I presume we could speak with the Secretary of Defense himself about it. He has the overall authority as a Cabinet officer.

But we can live with that sort of thing and work with it. All we want are the orders and the decisions, and the opportunity to be heard with respect to our case, if anything comes that we are interested in.

Senator SALTONSTALL. And you believe that this order, and all the authority that will go with it by the subsequent orders that will come, will help and will not hurt the accelerated program which we all believe is so necessary?

Secretary BRUCKER. Yes, I do.

Senator SALTONSTALL. Thank you, Mr. Chairman.

Senator STENNIS. Senator Flanders?

Senator FLANDERS. Mr. Secretary, there are two points I wish to raise.

One of them, a question I wish to ask, is this:

Has the responsibility for the development of the antimissile missile been assigned as yet?

Secretary BRUCKER. No. The Secretary of Defense has indicated in a general way, Senator Flanders, that he is moving in the direction of what he calls an agency that is denominated as the Advance Research Projects Agency. It has not been defined, but he says that he intends to have that agency to parallel or to be on the same level with the office which Mr. Holaday heads in the field of the missiles, and that the new agency will be responsible for satellites and spaceships, space vehicles, and matters of that kind.

Senator FLANDERS. That is the assignment for development?

Has there been any discussion as to the assignment operation?

Secretary BRUCKER. No; there has been no discussion on that basis yet.

Senator FLANDERS. Of course when, as and if that discussion arises, it would seem appropriate to me that that should be in the task of the Army, to operate that ICBM.

Whether it will be or not we don't know, but I put that down in the record for my personal opinion right now.

Secretary BRUCKER. Thank you very much.

Senator FLANDERS. One other question and that is this:

In seeking the development so far as it has gone of the intermediate range weapons and the rather elaborate and movable, substantially ground equipment that is required for launching it, it has struck me that there are possibilities in the use of other fuels than those used in the present IRBM and there again I would raise the question as to whether if more nearly complete mobility can be achieved for longer ranges up toward the intermediate range, it would again seem to me to be appropriate to assign those missiles to a mobile army.

So I put myself on record as thinking naturally along those lines with the limited knowledge which I have at the present moment, but I hope that those points will be taken into consideration by the Secretary of Defense in his ultimate determinations.

That is all, Mr. Chairman.

TIME PERIOD FOR LAUNCHING SATELLITE

Senator STENNIS. Thank you, Senator Flanders.

Mr. Secretary, I will be very brief. At the bottom of page 3 you made this statement:

The Army has a capability to make significant contributions in this conquest of space. It has not only the ability with existing equipment to begin

launching small satellites almost immediately, but it has an incomparable reservoir of experience in rockets, guided missiles, ballistic missiles, and space vehicles.

Now, without getting into a discussion of time, and I don't think it is well to do that at all, your statement there with the sentence beginning at the bottom of page 3, the last sentence beginning there, it seems to me leads a casual reader to believe that you are right on the brink of sending up a satellite.

You say almost immediately. You did not mean to suggest days or just a few weeks that you would be taking off, did you?

Secretary BRUCKER. Senator, I would rather not define what I meant by "immediately." I would rather let the action suit the word.

Senator STENNIS. That is what I want you to do, but it looks to me like the words "almost immediately" contemplate just a few days, but I don't suppose that is a correct interpretation, just a few days.

Secretary BRUCKER. No, I am not desirous of having that connotation taken from that context.

Senator STENNIS. Now, Mr. Secretary, I look upon you as a very capable, experienced, and effective member of the Government here in Washington doing a splendid job over in the Pentagon. But on this question here now of creating these authorities here—one as Director of Missiles, the other Director of Spaceships and Satellites—it is hard for me to distinguish between those two and why they should be separated.

Can you? And give a reason for your distinction.

Secretary BRUCKER. I would not want to prejudge the reason why the Secretary of Defense did that.

Senator STENNIS. I did not ask you that, Mr. Secretary. I want your reason.

Secretary BRUCKER. My reason would be that he wanted to preserve a difference between the two because he felt that it would be too great a burden for one man. I think that is what he had in mind.

SAYS THEY ARE OFF IN RIGHT DIRECTION

Senator STENNIS. Are they not so intermingled, though? I know they are different, but is not the problem so closely connected, the whole desire to get this program moving along faster, as you well put it, are not they all so tied together that instead of being divided, they should be consolidated and an overall plan made? Do you not think that, now, as an administrator?

Secretary BRUCKER. There is a very good reason to have Mr. Holaday take on both. On the other hand, this new man, Secretary McElroy, has shown every evidence of wanting to get a job done in a hurry and not putting somebody else with a different layer of authority, and I think that he is leaning in that direction very strongly.

You will notice that he yet has not crystalized it. I think that time will do a lot in that direction in helping him to see his way through it.

Senator STENNIS. As an experienced administrator and a former governor and a successful lawyer, I do not want to embarrass you because you are part of the setup in the Department of Defense, but I just cannot see anything short of absolute authority and power to plan and direct and carry this missile program through.

Mr. Holaday testified a few minutes ago that should there be differences of opinion between him and the Secretary of Defense, that

his directorship stops right there, and he would not feel free to go to the President with his side of that picture. So I say that that proves very strongly to my mind that Mr. Holaday is a Director who cannot direct, but even if he gets over that impediment or obstacle and gets the Secretary to go along, the Director of the Budget can stop him, a wholly unrelated separate independent agency of the Government. The Director of the Budget can stop him.

Knowing this program as well as you do, do you not just as a citizen think there has got to be authority that can move right on over an obstacle like that and carry out this plan, to be effective in the emergency you speak of here in your statement to meet that?

Secretary BRUCKER. Senator Stennis, if it were not for the fact that the Secretary of Defense has such great power, even tremendous—he is a brilliant man and very vibrant and vigorous and wants to move into this field—I would have a great deal of hesitation in not agreeing with you on that. But I know his attitude toward it, the fact that he personally wants to see that these decisions are not only prompt but right. It is not like a baseball umpire calling strikes and balls; he must have the advice of his principal assistants, and after hearing the whole thing in great detail, make the decisions. I think he is wise in taking his time to decide this thing.

Now, as to whether he is going to decide to have another man with this agency or not, I do not know. He could, of course, resolve this when he gets back by coalescing the two under one head and giving him authority. But that is a matter, of course—

Senator STENNIS. You are going back and talking about these two authorities here—the satellites, spaceships and missiles. I was talking about an overall director of all of the program including missiles that would be exercising direct Presidential authority, and that is superior to the Director of the Budget, the Secretary of Defense and everyone else. Is it not going to take something like that to get the job done?

SHOULD NOT INTERPOSE ANOTHER AUTHORITY OVER SECRETARY

Secretary BRUCKER. May I say this, sir: I think that you have that in the Secretary of Defense. I think the Secretary of Defense has supreme power in that field. I think with his entry to the President and the Cabinet, and with all that I have seen with the security and the rest—the legal power that he is clothed with, his ability and knowledge—that is very much better to center the authority in the Secretary of Defense than to put another layer above him. I really do.

Senator STENNIS. I was not passing on the Secretary of Defense. I was talking solely about a system that would be superior and that everybody in the Government would know, and I think that is a big factor, that everyone in the Government would know that this man does have the supreme authority, limited only by the President of the United States. I think that is the biggest point about this: the overall director who has the authority to direct.

You started to say something?

Secretary BRUCKER. I do not want to press the point. All I wanted to say was.

Senator STENNIS. I just want your opinion.

Secretary BRUCKER. My opinion is that if the Secretary of Defense will exercise that power, that with his close proximity to the President of the United States and all of the other agencies of Government here, and with his stature in the Pentagon, and with the knowledge that he is moving in and doing these things—you could not have anything better. Another person there would be a layer in a horizontal way, and you have enough layers vertically without putting another one horizontally.

Senator STENNIS. But with all the duties and responsibilities of the President of the United States, they daily call him to many, many things, even call him to other parts of the world, I know as a practical matter he does not have a chance nor does he have the time to give very much attention to the actual planning or direction of the missile program or any other kind of major program.

I would like to see him lift this thing above all the ordinary realms and clothe this someone with this power, his power to act directly. I believe it would help you and others in carrying out your particular mission.

Senator Bush, you are next.

Senator BUSH. Thank you, Mr. Chairman. I will be very brief, Mr. Secretary. Having just returned from a trip of some 7 weeks in Europe under the auspices of the Army, I was quite interested in your prepared statement, and I congratulate you on that statement.

I also congratulate you on the remarkable condition of our Army in Europe. I was enormously impressed with it.

Secretary BRUCKER. Thank you.

Senator BUSH. With its readiness, with its training, with the quality of the men, with the morale of the men and even their families, with the equipment, with their schools for officers and men, and so on. I think this is probably the most remarkable organization that we have ever had in war or in peace so far as an Army is concerned, or that any nation has ever had. So I can appreciate your concern in having it continue to be the most completely armed and efficiently armed that it possibly can be.

I want to ask you a question which you do not have to answer, but it has not come up yet. Sometime ago I believe the Defense Department placed a limitation on the Army's use of missiles, and limited the use to a 200-mile range.

LIMIT OF 200 MILES ON ARMY MISSILES STILL IN EFFECT

Secretary BRUCKER. That is correct.

Senator BUSH. Is that directive still in effect?

Secretary BRUCKER. It is. It is the directive of November 26, 1956. That is still in effect.

Senator BUSH. Would you care to comment on that at the present time or not?

Secretary BRUCKER. Yes; I will comment on it. That was in the light, I suppose, of events of 1955 and 1956 up until the fall of 1956. And while I am not in position, of course, to be critical or destructive of the Secretary of Defense or the persons that made that order, all I can say is that times have changed a lot since then, and when one thinks back to the climate of what we were thinking about and talking about in those days of the summer of 1956 and what you are

confronted with now—with the Soviet having these intermediate range missiles in their armor, in their arsenals in great number, and with people shooting at us with a range that we cannot shoot back—we are, of course, very eager to answer the question, to say to you that times have changed. We feel that maybe a new look at that some day would be a good thing.

Senator BUSH. Is this a matter that is pending within the Defense Department now?

Secretary BRUCKER. No, it is not pending at the present time. We have accepted it. We do not fight it or resist it. We are doing the best we can. We are living with it. But in the future as things come in, we feel that in this climate it ought to be, of course, re-examined.

Senator BUSH. I take it you feel that events subsequent to the time when that directive was issued—

Secretary BRUCKER. That is right.

Senator BUSH (continuing). Would justify reconsideration of that directive at the present time, with the view to removing it and certainly extending the mileage limitation or in some way loosening up on the situation so that the Army might take advantage of its developments in the field up to the intermediate-range ballistic missile?

Secretary BRUCKER. Yes, we do. We feel that way about it.

ARMY STANDS READY TO DO MISSILE LAUNCHING JOB

Senator BUSH. You feel that way about it. It has occurred to me in looking at this whole problem that there might even be considered a closer working arrangement between the Army and the Air Force. The launching of missiles, after all, has been the Army's job when they are launched from land historically and even to this moment, and I am a little surprised to find that the Air Force is building launching sites to launch missiles when it seems to me that that would properly fall into the responsibilities of the Army.

Would you care to comment on that or not? I do not ask you to.

Secretary BRUCKER. I do not think anyone should fail to comment on things, no matter how personally embarrassing they are to the service. In the sense that we do not want to stir up any controversies, interservice or otherwise, may I just say this about it: We do feel that historically and from the standpoint of our readiness and from the way in which these men are trained, that technically, scientifically, from an engineering standpoint with the backup of all these things that I have mentioned here, the ordnance and all the rest of our mobile concept to back it up—that we are ready and equipped to do that kind of a job, and that we would like to do it.

On the other hand, we respect authority. We are good soldiers. When an order comes and they say 200 miles, that is it. You have not heard anything from us. We have gone back and gone to work and we will say we will work within that. But the time has come when these events have caught up with us. It is all different, a new ball game now from what it was back in the days of that. We are now confronted with somebody who has outgunned us on our own field. I mean by that our field of being able to launch ground-to-ground missiles. And by "missiles" I mean the same as artillery extension in space and time. We feel very rightly, I think, that we do have the competence to do it.

Now, we are not stepping out and advertising, nor do I want here to start the slightest bit of thought that we have a controversy that we are raising with our brothers of the Air Force. We are working as closely as we can with them, and in the fact that the Jupiter missile has been assigned to the Air Force to fire, we are willing to train their forces and to give them all the support that we can. We have gone to great limits to express that. We flew down to Huntsville the other day, the Chrysler plant in Detroit the next day. We are going Sunday and Monday to the other coast. We are willing to go to great lengths in training them as far as we can. Of course, they are not used to it. We realize that. But we are willing to overlook that and to help in any way we can, because the people do not care who does what, so long as the country gets the missile and gets it fired.

Senator BUSH. You feel it would be logical, though, for the Army to be charged with the responsibility of launching missiles from the ground?

Secretary BRUCKER. We most certainly do.

Senator BUSH. I want to make clear for the record, Mr. Chairman, that nobody has prompted me to ask these questions of the Secretary. These questions occurred to me while I was in Europe and they occurred to me while I was in the West with my good friend, Senator Flanders, and two other Senators, where we discussed these matters with Air Force people and so forth, and got briefed on this whole business of launching missiles. And it occurred to me, not from any suggestion that was made by anybody but just as a reasonable thing: Why are other services in this ground-launching business which really, it seems to me, is particularly the responsibility of the Army? Are we going to have some new ground forces now that are not in the Army? I mean it seems to me we are complicating the situation further by moving in that direction.

Senator FLANDERS. Will the Senator yield?

Senator STENNIS. Will the Senator yield?

Senator BUSH. Yes; I want to yield to the Senator. But that is why I brought this up. I want to make this very clear. I have not discussed this with any Army officer or the Secretary or any of the Army people.

Senator STENNIS. I believe the Senator made a good statement. Senator Flanders.

Senator BUSH. I would like to yield to the Senator from Vermont here.

Senator FLANDERS. It strikes me the principle which was just put into words a few minutes ago of a mobile weapon for a mobile army should be the determining factor, and we saw weapons out there that were movable but not mobile, and I think that is where the distinction should be made.

I wonder if the Senator agrees with me?

Senator BUSH. I think that mobile weapons for mobile armies is fine, but I do not include the fact that weapons such as the Nike, which is fired from a fixed site, should not be the business of the Army.

Senator FLANDERS. I would not want to discuss what I have in mind except in executive session, Mr. Chairman.

Senator STENNIS. All right. Any other questions?

Senator BUSH. No, Mr. Chairman; I think that is about all. I am grateful to the Secretary for his impromptu observations on this. I think he has got a good deal of merit on this side in his argument.

Senator STENNIS. The counsel has a question.

Mr. WEISL. In order to straighten this out, I did ask Secretary McElroy, who testified, why it was that the Army would not be permitted to use the Redstone missile if it had a range of over 200 miles; and he stated that that was being reconsidered.

Secretary BRUCKER. Thank you.

HOLADAY HAS NO POWER TO ASSIGN FUNCTIONAL ROLE

Mr. WEISL. I would also like the record to show, if you agree, Mr. Secretary, that while the directive of Mr. Holaday is to direct the missile program, he has no right under that directive to assign to the Army a missile whose range exceeds the mission of the Army; is that right, Mr. Secretary?

Secretary BRUCKER. That is right, he has no power to do that.

Senator STENNIS. Mr. Secretary, we certainly do thank you for your testimony, and we hope that you can stay with us while we have General Taylor and General Gavin, but, of course, if other things come up, you do not have to stay.

Our next witness, members of the committee, is Gen. Maxwell Taylor, Chief of Staff of the Army.

General Taylor, you are a man of tremendous experience in the military field. You have led our soldiers into battle in two different wars and hold some of our country's highest decorations.

Missiles, which is the subject of this hearing, are ultimately designed to be used by the armed services. This brings to you all the problems of reorganization that always go with new weapons. We would be very interested in hearing your discussion of these problems. We are also interested in how you cooperate or propose to cooperate with the other services.

In order to save time, I would like to place your biography in the record. It is a distinguished biography and we are fortunate that America has such dedicated men as you, and I have enjoyed reading over recently here in the last few minutes, General Taylor and members of the committee, this splendid biography here and I commend you most highly for such a splendid record.

(The biography referred to is as follows:)

GEN. MAXWELL DAVENPORT TAYLOR, UNITED STATES ARMY

Gen. Maxwell D. Taylor was sworn in as Chief of Staff, United States Army on June 30, 1955 after a long and brilliant military career.

General Taylor was born in Keytesville, Mo., August 26, 1901. He graduated from the United States Military Academy, No. 4 in the class of 1922, and was commissioned a second lieutenant in the Corps of Engineers.

From 1922 to 1940 General Taylor had many important assignments both at home and abroad. He attended and graduated from the Command and General Staff School and the Army War College.

In December 1940, he assumed command of the 12th Field Artillery Battalion at Fort Sam Houston, Tex. In July 1941, he returned to Washington, D. C., for duty in the Office of the Secretary of the General Staff, where he remained until July 1942, when he was transferred to Camp Claiborne, La., as Chief of Staff of the 82d Infantry Division. In this capacity, he personally assisted in the development of the first airborne divisions of the Army, becoming Artillery Commander of the 82d Airborne Division on December 4, 1942.

He went overseas with his division in March 1943, and took part in the Sicilian and Italian campaigns. In March 1944, he became commanding general of the 101st Airborne Division, which he led in the airborne invasion of Normandy on June 6, 1944; the airborne invasion of Holland on September 17, 1944, and the campaigns of the Ardennes and Central Europe.

In September 1945, he returned to the United States for duty as Superintendent of the United States Military Academy at West Point, N. Y.

In January 1949, he was assigned to European Command headquarters at Heidelberg, Germany, as Chief of Staff, and the following September became the first United States Commander, Berlin.

He was appointed Assistant Chief of Staff for Operations, G-3, in the Department of the Army, February 13, 1951. On August 1, 1951, he became Deputy Chief of Staff for Operations and Administration of the Army.

He was appointed to succeed Gen. James A. Van Fleet as commanding general Eighth Army in Korea, and assumed command on February 11, 1953. Under him, the Eighth Army engaged in some of the bitterest fighting of the Korean War, and until the armistice was signed on July 27, 1953. Under his supervision, the Republic of Korea Army was built into a 20-division force.

On November 20, 1954, he was placed in command of all Ground Forces in Japan, Okinawa, and Korea when he took command of the combined staffs of the United States Army Forces, Far East, and Eighth Army, with headquarters at Camp Zama, Japan.

On April 1, 1955, he was named commander-in-chief of both the Far East Command and the United Nations Command and served there until he was made Chief of Staff of the United States Army.

General Taylor has received numerous decorations for bravery and heroism including the Distinguished Service Cross, Distinguished Service Medal, the Silver Star, the Legion of Merit plus many foreign decorations.

Senator STENNIS. We will be glad to hear from you now and I will ask committee counsel to start the questioning.

TESTIMONY OF GEN. MAXWELL D. TAYLOR

Mr. WEISL. General Taylor, each of the services now has guided missiles which are operational, and is developing other missiles. Would you tell us in somewhat greater detail what is the Army's interest in the missile field?

General TAYLOR. The Army has been interested in missiles for a long time. If the committee is interested in a little history, I might say that that interest started in 1812. We were on the receiving end of rockets then from the British forces who fired rockets at us both in the area of Baltimore and also in the Battle of New Orleans. I am quite sure that was the goad to us to take advantage of the possibilities of rocketry, so that in 1846 we had a rocket battery in the American Army which took part in the Mexican War.

The advent of the rifled cannon rather put the rocket out of business because of the increased accuracy, so it was not again until World War II that the Army really moved forward in the rocket field. We were impelled to these efforts by the evidences of success on the part of the Germans. I stood in the front lines at Holland and watched a V-2 launched from a mobile launching site not far from the front line headed for London, and regretted the fact that we had no such weapon with which to respond, although we did have, of course, the bazooka and small caliber rockets in World War II.

Following World War II we immediately took as a prime objective the assembly of the very able German rocket experts from Peenemunde.

That action, of course, was the origin of the Dr. von Braun group working with us now.

Simultaneously, we recognized that our antiaircraft artillery must take advantage of the rocket principle, that in a very short time the performance of aircraft would exceed the capabilities of conventional antiaircraft artillery.

So side by side we have brought forward the surface-to-surface missile and the surface-to-air missile to their present important position in the Army arsenal today.

It was the pictures from the Soviet November 7 Parade, however, which reminded us that just as in World War II the enemy have rockets for which we had no counterpart. In the mid-range field it is quite apparent now that the Soviet forces also are equipped with a rocket to which we have no direct response.

So I would sum up by saying that it has been a natural transition from so-called conventional terrestrial artillery to surface-to-surface missile. Similarly, an easy transition from antiaircraft artillery to our Nike family which is now appearing in its second version, the Nike-Hercules and which we hope will be followed by the Nike-Zeus which has been described by Secretary Brucker.

Mr. WEISL. General Taylor, is it not a fact that surface-to-surface missiles and surface-to-air missiles are really an extension of artillery, in principle?

General TAYLOR. That is correct, sir.

Mr. WEISL. Now, field artillery and the antiaircraft artillery has been in what branch of the military service over the years?

General TAYLOR. In the United States Army.

CONFIDENT OF ABILITY TO PRODUCE ANTIMISSILE MISSILE

Mr. WEISL. With that in mind, General Taylor, do you not think you ought to tell us about the Army's experience and capabilities in the field of guided missiles?

General TAYLOR. I have perhaps in my opening response to the first question outlined in very general terms the experience we have acquired. The Nike-Ajax was the first operational surface-to-air missile in the world that we know anything about. You have evidence of its presence around our principal cities today. We have built on the Nike-Ajax principle and brought forward the Nike-Hercules, which, as Secretary Brucker says, has greater height capabilities, range capabilities, and also has a more lethal warhead, and from there I am quite confident of our ability to move forward into antimissile-missiles field, and produce a missile which would meet all requirements of manned aircraft and missiles.

I might mention at the same time our low level surface to air missile, the Hawk, which is necessary to take care of the very low flying airplanes which cannot be coped with by other types of missiles. In my judgment, it is reasonable to forecast a combination of the Nike-Zeus and Hawk, which would be as nearly an optimum air defense as we can imagine at the present time.

Now, similarly in the surface-to-surface field, we have developed and have in use missiles of a wide variety of ranges, some only a few thousand yards in front of our lines deliberately made short range to cope with the immediate battlefield target.

Then the longer range corps-type weapons, at the present time the Corporal 75-mile missile to be replaced later by the Sergeant,

which will be an improved version. Then we have the Redstone which has been mentioned, which reaches out to 200 nautical miles.

We are very much interested, as both the Secretary and I have indicated, in closing the spectrum gap between the Redstone and the 1,500 mile IRBM, in which category the Jupiter is the Army representative.

Mr. WEISL. Have you any plans or proposals, General Taylor, for the development of a midrange missile?

General TAYLOR. We have, sir.

Mr. WEISL. What are those plans, sir?

General TAYLOR. It is actually a double-barreled proposal. One derives from a scientific breakthrough on the part of our people at Redstone who now see the possibility of taking the Redstone missile itself and giving it greater range. It would not like to go into technical details.

This modernization of Redstone is the first step. Then as the longer-range step, we would go for a solid propellant missile of a very light weight which would have great mobility and also have extended range. We have such a proposal which we think is feasible.

Mr. WEISL. And you would rather discuss that proposal in detail, if necessary, in closed session.

General TAYLOR. It should be in closed session.

Mr. WEISL. While our inquiry, General Taylor, deals primarily with ballistic missiles and satellites, I wonder if you could tell us what effect the emphasis on missiles during recent years and at the present time has on other Army plans and requirements?

CONVENTIONAL ARMAMENT PROGRAMS HAVE SUFFERED

General TAYLOR. We have found our missile programs have lived up to their technological expectations, but unfortunately they have come very high in dollar costs. So within the comparatively limited budgets we have had to work with, to a large extent we have had to pay for the missile program out of what you might call conventional equipment.

I am always disturbed by that, and each year try to strike a reasonable balance so we can be sure of replacing our equipment, which is not in the missile category, at a reasonable rate.

I have always emphasized that the Army should have an unconventional-conventional capability, an unatomic-atomic capability, because there are many situations in which these missiles cannot be used.

Mr. WEISL. General Taylor, can I ask you, within the limits of security, of course, whether you would care to advise the committee concerning the Army's concept of the mobile deployment of the Jupiter and the Redstone?

General TAYLOR. We have always thought in terms of a mobile missile. I think that is instinctive, because all of our equipment is mobile and we are not interested in equipment that cannot be moved from place to place.

We have actually packaged the Redstone on this basis, and the Jupiter offers no greater problem in giving mobility to it. By "mobility," of course, I mean breaking it down into loads and hauling to most places. There are degrees of mobility in all things, but it is highly important, in my judgment, to be able to deploy these weapons

in remote places where they can be protected themselves, and also where they will not draw fire on cities and important installations.

Mr. WEISL. And you believe, General Taylor, that the Army, based on its long experience in moving heavy weapons, is capable of doing that job?

General TAYLOR. I am sure it can.

Mr. WEISL. In view of what you know, General Taylor, about the capabilities of the Soviet Army, are you satisfied with the capability of your Army?

General TAYLOR. I have always had occasion to say that any Chief of Staff who is satisfied should be fired, and I am not satisfied with the present Army, in spite of the kind remarks made by Senator Bush.

I have estimated we need over \$400 million for new equipment in our pentomic divisions. That could include some items in the missile field, but not necessarily all. Modernization comes very high, and necessarily we are going to have to face this requirement in accordance with the budgets available to us.

Mr. WEISL. Could you give some estimate, General Taylor, if possible, as to the relative rate of the modernization of the Soviet Army as compared to our Army, provided it is within the realm of security to do so?

RUSSIANS TACTICAL MISSILES HAVE RANGE EXCEEDING OURS

General TAYLOR. It is very difficult to make accurate comparisons, but we know that the Soviets have replaced most of their World War II equipment of any importance since World War II.

For example, they have a new line of artillery, tanks, trucks, of what we would call conventional equipment.

Then we know they have been very active in the missile field, and the pictures of the November 7 parade have confirmed the fact they have tactical missiles of varying ranges to include ranges beyond those presently available to our Army.

Mr. WEISL. Are there any further matters, General Taylor, about which I have failed to ask you, that you think this committee ought to know?

General TAYLOR. I think the counsel is a very effective cross-examiner, and I will make no suggestions.

Mr. WEISL. I want to tell you, General Taylor, that I have interviewed all of your staff, and each of them has made a very deep and lasting impression upon me as to their ability and their dedication to their duties.

General TAYLOR. In their name, I thank you, sir.

Senator STENNIS. General Taylor, I will be very brief in the few questions I have here, and I have no idea what your answers are going to be in this matter of the Joint Chiefs of Staff, but I do value your opinion.

As Chief of Staff of the Army, you are the man who makes the final decision about what the position of the Army will be with reference to military matters?

General TAYLOR. In the presence of my Secretary, I would be very loath to make that answer.

Senator STENNIS. Well, in approaching a meeting of the Joint Chiefs of Staff, you are the gentleman who makes the decision here as to what

would be the position of the Army on military matters and strictly military planning, is that not right?

General TAYLOR. It is, except I would say, Senator, that I make every effort not to feel I go there as an Army representative. Most of the questions, as a matter of fact, are not purely service questions.

On the other hand, it is quite true that my immediate advisers available to me are Army officers, and their recommendations I pass on.

Senator STENNIS. I know, but you go there as Chief of Staff of the Army.

General TAYLOR. No, sir; I try not to. I try to go there as the Army representative on the Joint Chiefs of Staff.

Senator STENNIS. Well, who goes there as representative of the Army, when the Joint Chiefs of Staff meet; who represents the Army; if you do not, who does?

General TAYLOR. Again, I am sorry to split words, but I consider myself to be two individuals, the Chief of Staff of the Army, the subordinate to Secretary Brucker, in a departmental sense. Then, in another hat, I am a member of the Joint Chiefs of Staff and, as I say, to the extent possible, I try to forget the Army and try to view the whole national problem.

Senator STENNIS. I appreciate your deference there to the civilian authority. You say, if possible, you try to forget the Army. But I do not see how you could, reading your record here in the Army, the time you have been in it, and the distinction you have brought it. Anyway, you are there, and, when matters come up, as you are covering here about the role of the Army, you are the man who speaks for the Army, are you not?

General TAYLOR. At the Joint Chiefs level.

Senator STENNIS. To that extent, you are a witness for the Army, and then you are required to turn around and sit on a jury and make decisions, are you not?

General TAYLOR. Yes, sir; except I would point out again that the vast majority of the questions before the Joint Chiefs of Staff are not service issues.

Senator STENNIS. Well, I am thinking more of this planning now, because I run across this path of roles and missions, and I am not trying to say where they should go; I do not know, but I do know you have quite a job. And someone has got to represent the Army and the Army viewpoint, not only as a witness but as an advocate.

What worries me is then you have to turn around and sit on the jury. I am a lawyer, and I like to use those analogies. Then the jury has got to render a verdict, and there are only three on that jury. Now, that is what disturbs me. Do you not think that system could be improved?

DIVISION OF FUND IS WHAT CAUSES DIFFERENCES

General TAYLOR. I would like to make a statement that would be helpful.

We do have our difficulties in the Joint Chiefs, obviously, although over 90 percent of our positions are unanimous. We do not have our difficulties in the field of military planning, I would say.

Also, I make the point that most of the planning, military planning, war planning, is done by unified commanders, and we approve their plans.

Now, these are straightforward military problems to which we can apply our professional experience and, ordinarily, have no difficulty on agreeing on such plans.

It is rather in the budgetary area, the division of resources, the placing of emphasis as to types of forces, that is where we have very definite difficulties, because they are very hard problems to solve.

But I would not say that military planning, per se, is an area in which the record would show the present system is weak.

Senator STENNIS. Well, Mr. Secretary, I will not belabor this question any longer myself. I understood you have a cold and might have fever, and I do not want to prolong the examination now.

Chairman Johnson had certain questions here, some of which he—

Senator BUSH. Would you yield to a question apropos of your last question?

Senator STENNIS. Yes.

Senator BUSH. The general spoke of unified commanders making recommendations. Just what does that mean? Give us an illustration.

General TAYLOR. The unified commander—General Norstad is our unified commander in Europe. Admiral Stump is our unified commander in the Pacific. General Montague, in the Caribbean.

Senator BUSH. I thank you.

QUESTIONS AS TO THE CHIEFS OF STAFF

Senator STENNIS. There are some questions that Senator Johnson had, General Taylor, some of which pertain to the work of the Joint Chiefs of Staff, the Chairman, and in your two-hat status. Without objection by the committee, I will insert those questions into the record, General Taylor, and you may answer them for the record at your early pleasure.

General TAYLOR. I would be very happy to.

Senator STENNIS. Very good.

(The questions by Senator Johnson are as follows:)

1. Questions have been raised concerning the two-hat status of the Chiefs of Staff who are also members of the Joint Chiefs of Staff. What is your experience in performing both functions—that of Chief of Staff of your service and that of being a member of a joint group responsible for the principal military advice to the Secretary of Defense and the President?

2. Do you find that the delegation of duties to your Vice Chief, as provided for in the reorganization of 1953, relieves you of sufficient time for your duties as a member of the Joint Chiefs of Staff?

3. Has the problem of the Joint Chiefs of Staff having too much paperwork been relieved by the strengthening of the Joint Staff under the direction of the Chairman of the Joint Chiefs of Staff?

4. What difficulties do you encounter in arriving at joint approval of war plans designed to meet the military requirements for all United States commitments?

5. Do you favor that provision in the National Security Act which states that the Chairman of the Joint Chiefs of Staff shall—

“Sec. 211 (e) (3) inform the Secretary of Defense, and when appropriate as determined by the President or the Secretary of Defense, the President, of those issues upon which agreement among the Joint Chiefs of Staff has not been reached.”

6. To what extent are military experts so divided on questions of strategy and tactics that problems primarily involving military operations have to be resolved by their civilian superiors?

7. What are the advantages and disadvantages of split decisions among the Joint Chiefs of Staff? Have you ever had any pressure brought upon you to arrive at unanimous decisions?

8. Do you think the Secretary of Defense should have a military staff to advise him, in addition to the Joint Chiefs of Staff? If not, what suggestion would you make which would enable the Secretary to make wise decisions on matters which are undecided in the Joint Chiefs of Staff?

9. This committee would like you to give these basic problems some deep and penetrating thought and to furnish us with a memorandum covering—

(a) a clear statement of the problem involved in the organization of the military planning function and the relationship between planning and operations;

(b) the proposals which have been made to meet this problem;

(c) the probable repercussions of each proposal;

(d) an analysis of the types of action required for putting each proposal into effect, i. e., legislation, departmental regulation, a reorganization plan, a directive by the President.

(The answers by General Taylor to Senator Johnson's questions appear elsewhere in the record, together with the answers of General White and Admiral Burke in response to the same questions.)

Senator STENNIS. Senator Saltonstall?

RUSSIAN MISSILE WHICH HAS NO UNITED STATES COUNTERPART

Senator SALTONSTALL. General Taylor, I am sorry you are feeling ill, and I will be very brief. You said that the Russians have an intermediate missile for which we have no counterpart. Did I understand you correctly?

General TAYLOR. Midrange, I would say.

Senator SALTONSTALL. Midrange?

General TAYLOR. Yes, sir.

Senator SALTONSTALL. What does that mean; 500 miles?

General TAYLOR. It means something between 300 and 500, perhaps; something of that nature.

Senator SALTONSTALL. You say, in reply to that, that, with the Redstone or with something based on the Redstone, we could, fairly quickly, develop such a missile?

General TAYLOR. We could.

Senator SALTONSTALL. Is the Hawk in production?

General TAYLOR. No, sir; it will be in production this next year.

Senator SALTONSTALL. Is it in the operational stage yet?

General TAYLOR. It is ready to go into the operational stage. Unfortunately, the planned production rate is slow.

Senator SALTONSTALL. What was that?

General TAYLOR. The planned production rate is slow.

Senator SALTONSTALL. Let me ask you just 1 or 2 more questions along the lines that Senator Stennis asked you which interest me.

Is there any legislation, in your opinion, needed for the improvement of the Unification Act? Or is it a question of Executive authority?

General TAYLOR. That is hard to answer, sir, because first we would have to agree what changes we have in mind.

I have been asked by Members of Congress in previous appearances about my position on fundamental changes in the Department of Defense. I have been inclined thus far to say that undoubtedly there are areas in which, it seems to me, improvement should be sought. But I do not have and am not ready yet to table a solution.

I think it takes time and observation and more wisdom than I presently have, to come forward with those points. So until I am sure what proposal I would table, I could hardly say what legislation would be required.

Senator SALTONSTALL. But it has been my feeling that there could be considerable changes made under the Unification Act by Executive order or directive.

General TAYLOR. That is undoubtedly true. And also, of course, I would stress the point that organization will only make the job easier for good men who make decisions; the decisionmaking power of individuals involved is beyond organization.

Senator SALTONSTALL. One more question: Should there, in your opinion, be more authority in the Secretary of Defense?

General TAYLOR. I would say not, within my observation.

SEES SERIOUS DISADVANTAGES IN SEPARATING POSITIONS

Senator SALTONSTALL. Senator Stennis asked you about planning, the military planning in the Chiefs of Staff. I will put the question in this way: Have the present Chiefs of Staff, the Joint Chiefs of Staff, the time and the energy to give to capable planning?

In other words, have you a staff now that is sufficiently free from operational difficulties and operational jealousies, if you will, to give overall unified planning and advice to the Joint Chiefs of Staff?

General TAYLOR. I would say we have the organizational facilities within our respective staffs for the job.

With regard to the individual ability of a Chief to be two people and do the double job, there is definitely a question. I always find that it takes 7 days a week, and still never quite satisfy myself with the work accomplished.

On the other hand, the disadvantages of separating the two positions would be very serious, and for the moment I would prefer to stay with the present organization.

Senator SALTONSTALL. One final question: Are you in favor of the principles enunciated in the Cordiner report?

General TAYLOR. I am.

Senator SALTONSTALL. Mr. Chairman, thank you.

I am sorry you are ill, General.

General TAYLOR. Not at all.

Senator STENNIS. Senator Bush?

Senator BUSH. Mr. Chairman, I think I would rather ask the questions which I have in mind in executive session, of the General. And I take it he will be called later on for that purpose, so I will not ask any questions right now.

Senator STENNIS. General, Senator Saltonstall mentioned here the Cordiner report.

The Cordiner report has had some hearings, but these were not concluded, but they will be just as soon as we can complete them.

You said that you endorsed the principles of the Cordiner report. Now, one of the things the Cordiner report said was if it was carried out, it would save \$5 billion a year within a few years. The American people have been told that many, many times. It has been said in the newspapers and on the floor of the Senate as a conclusion.

But when our subcommittee that I have the honor to be chairman of had Mr. Cordiner before it, who is the only witness we have had so far, and I asked him the question to present the proof about the \$5 billion saving, he said that was not his estimate, he did not make any such estimate as that, and said the Department of Defense supplied that figure.

I just point that out to illustrate here how something is being kicked around all over the Nation, but when called on for proof, why, they did not get down to details.

Now, I did not have a further chance, but I submitted questions to the Department of Defense more than 90 days ago, many questions on this Cordiner report, and up until just a few days ago, they had not been answered.

So before you endorse those principles, we are going to give you a chance to prove them. And I endorse some of them, too.

General TAYLOR. May I say, sir—

Senator STENNIS. But I say some of this was propaganda.

General TAYLOR. I was going to say that the dollar estimate fell outside the question of principle which I endorse.

Senator STENNIS. I am sure it does, but I assure you I will not remain silent when that question comes up except to point out we are open for proof, and we know proof cannot be given on a strict, down-to-the-dollar basis.

But I am in sympathy with a lot of the principles of the Cordiner report, and hope we can get to detailed consideration of them soon.

Senator Saltonstall, do you have any questions?

Senator SALTONSTALL. No. It is too late.

I was just going to say, I though General Taylor was going back to his educational leadership when he drew a distinction between the principles and the actuality. [Laughter.]

INTERROGATIONS BASED ON TESTIMONY AT AIRPOWER HEARINGS

Senator STENNIS. General, the committee—I think the record ought to show that this is a little unusual hour to be in session, and certain members have other things they are compelled to attend to, but Senator Symington had certain questions for General Taylor, and without objection the Chair will insert those questions in the record for Senator Symington, with the understanding that General Taylor agrees that they will be answered in time for the record. Is that all right?

General TAYLOR. Yes, sir.

(The questions by Senator Symington are as follows:)

1. In the airpower hearings, June 18, 1956, you testified:

"If the small war breaks out, we must suppress it promptly, because that small war may easily lead to the great war which we are all trying to avoid."

Do you still agree with that testimony?

So far as the Army is concerned, is it ready and capable to suppress successfully the small wars to which you referred?

How many divisions does the Army have now? Will have at the end of this fiscal year?

How many of these divisions are combat-ready?

How many are adequately equipped with atomic and other modern weapons?

How many divisions, as forces in being, do you need for the many commitments we have?

With the large amount of the Army budget going to point defense with Nike missile installations, do you believe you can modernize your Army for your other missions without significant increases in funds?

2. You testified in 1956 that your budget requirements for fiscal year 1958 "will be greater, primarily because of the modernization factor."

Your testimony was that you would require "around \$12 billion budget, something of that magnitude" for fiscal year 1958.

Do you recall what you did get?

Unless your estimate was padded, or world conditions have materially improved, a cut of almost \$5 billion must have required substantial curtailment in the Army's modernization and structure which you had thought necessary. Is that not correct?

Due largely to cuts by the administration from the original budget submission, the amount appropriated for fiscal year 1958 for the Army was about \$300 million less in new money than for fiscal year 1957.

What effect did this have on your modernization program?

Can you be explicit as to some of the major effects?

3. In 1956 you stated that you had "an open mind" on the question of greater unification among the services (p. 1289). At the same time you were asked whether you thought we had now achieved what General Eisenhower in 1952 referred to when he said: "Our defense program has suffered from lack of far-sighted direction. Real unification of our Armed Forces is yet to be achieved."

Would you point out to the subcommittee your current views on the state of unification in the services?

Do you believe that the defense planning has been improving significantly since General Eisenhower's speech in 1952?

Do you have any recommendations regarding elimination of duplication and improvement in organization in the Defense Department?

(General Taylor's answers to Senator Symington's questions appear elsewhere in the record.)

Senator STENNIS. Any other questions for the general?

Thank you.

Well, General Taylor, we appreciate very much the testimony you have given here, and we know that you have been helpful to the committee, as you always are.

General TAYLOR. I appreciate the consideration shown.

Senator STENNIS. Thank you very much.

We have another witness, and we would be glad for you gentlemen to stay, of course, but we do not require you to stay. You have other matters.

General TAYLOR. I am going to excuse myself.

Secretary BRUCKER. I will elect to stay.

Senator STENNIS. Gentlemen, what is the pleasure of the committee? Anything further?

General Gavin, you are the next witness, please, if you will come around.

General Gavin, along with others, you be sworn.

Do you solemnly swear that your testimony here will be the truth, the whole truth, and nothing but the truth, so help you God?

General GAVIN. I do.

Senator STENNIS. All right; let us have quiet, please.

Do you have some charts you want to use, General?

General GAVIN. Yes, sir; I have.

Senator STENNIS. Let him get them ready.

Mr. WEISL. May I proceed, Mr. Chairman?

Senator STENNIS. Here is something for the record.

Our next witness is a very distinguished combat soldier, Lt. Gen. James M. Gavin, Army Deputy Chief of Staff for Research and Development.

General Gavin, from the missile standpoint we feel that in you we are getting to men that actually do the work. Plans are necessary but somebody has to do the job, and for the Army, you are it.

Again, I would place your biography in the record. You have a very distinguished career. Americans can very well be proud of such dedicated and competent service and leadership.

(The biography of Lt. Gen. James M. Gavin is as follows:)

LT. GEN. JAMES M. GAVIN

General Gavin is a native of Mount Carmel, Pa., and was born March 22, 1907. He graduated from the United States Military Academy on June 13, 1929.

He held several important assignments until August 1940 when he became an instructor in the Department of Tactics at the United States Military Academy.

In 1941, he attended and graduated from the Parachute School. In September 1942, he went to Europe in command of the 505th Parachute Infantry Regiment. Under his command the 505th Parachute Combat Team spearheaded the assault of Sicily.

In October 1943, he was appointed assistant division commander of the 82d Airborne Division. The following month he went to London, England, as airborne adviser to the supreme commander. He remained on duty with the Supreme Allied Command until February 1944.

As assistant commander of the 82d Airborne Division, he participated in the parachute invasion of Normandy on June 6, 1944. He assumed command of the division in August 1944, and shortly thereafter commanded the airborne operation in the vicinity of Nijmegen, Holland. He retained command of the 82d Airborne Division throughout the remainder of the war, participating in the Battle of the Bulge and the spring offensive in 1945.

In July 1945, he served as American representative on the city Kommandantura in Berlin, in addition to his duties as commander of the 82d Airborne Division. In December 1945, he returned to the United States where he commanded the 82d at Fort Bragg until March 1948.

He was then appointed Chief of Staff of the Fifth Army at Chicago, Ill., until April 1949, when he returned to Washington, D. C., as Army member of the weapons systems evaluation group in the Office of the Secretary of Defense.

In June 1951, he went overseas as chief of staff of the Allied Forces in southern Europe. In December 1952, he assumed command of the United States VII Corps in Germany. In March 1953, he was named G-3, Department of Army, Washington, D. C.

In March 1955 he was designated as Deputy Chief of Staff for Plans and Research of the Department of the Army.

On October 10, 1955, he was appointed Chief of Research and Development with status as a Deputy Chief of Staff.

He has been awarded many decorations including the Distinguished Service Cross with oak-leaf cluster, Distinguished Service Medal; Silver Star with oak-leaf cluster; Bronze Star Medal with oak-leaf cluster; and the Purple Heart.

Senator STENNIS. General Gavin, we are very glad indeed to have you here. I do not know whether you have a prepared statement or not, but do you?

General GAVIN. No, sir; I do not have a prepared statement.

Senator STENNIS. All right. Questioning will proceed and I will ask committee counsel to start the questioning.

TESTIMONY OF GEN. JAMES M. GAVIN

Mr. WEISL. General Gavin, in the course of your duties and responsibilities, have you made a study of the capabilities of the Russian Army?

General GAVIN. Yes, Mr. Weisl, I have; and I do, and we keep currently abreast, as abreast as intelligence will allow, of the Soviet Army.

Mr. WEISL. Have you also made a study of the recent pictures that were displayed on November 7 of the various pieces of equipment in the Russian Army?

General GAVIN. Yes, we have. As a matter of fact, it is currently intensively underway.

Mr. WEISL. Within the limits of security and national interest, the judgment of which I must leave to your discretion, would you tell the committee what your conclusion is as to the capabilities of the Russian Army?

General GAVIN. Yes, sir; I will.

May I say that we have a mission given to us to carry out, and with that mission, and awareness of a most likely opponent, we get on with our programs.

We have not seen a great deal of the Soviet Army's newest equipment. We have been aware that they have been conducting missile development programs, and quite a few nuclear tests, and until November 7, or the 40th anniversary of the revolution, we really did not see much of their newest equipment and we did on that occasion see a great deal, a quite spectacular display of it in fact. I have here a few pictures that have been in periodicals that I would like to use, if I may, for a few moments.

Senator STENNIS. Certainly, General.

General GAVIN. I will stay right here, and Col. F. G. White of my staff will assist in showing you this material.

Senator JOHNSON (presiding). Proceed.

SIGNIFICANT IMPROVEMENT IN SOVIET WEAPONRY

Mr. WEISL. Proceed, please, General Gavin.

General GAVIN. Yes, sir; I will.

These pictures were released by the Soviets to periodicals worldwide, and they symbolize rather remarkable progress in a number of areas.

This first is an artillery rocket. Most people are familiar with the old Katusha Minenwerfer and Nebelwerfer, the rocket launched in World War II. This is a significant improvement over that, much longer. It has a helical spiral along the side to give it spin in flight and thus stability in flight. It appears to be quite an improvement over the old one.

May I have the next, please.

This is the first public display of the surface-to-air missile that may well be the most significant missile that we saw on that occasion. It appears from this configuration to be capable of carrying a nuclear warhead. It is a two-stage rocket. It is carried on a mobile launcher, so it goes with the field forces wherever they go and, of course, also could be emplaced about sensitive areas and the like of that.

Next please.

Mr. WEISL. General, you do not mind my interrupting?

General GAVIN. Not a bit, sir.

Mr. WEISL. Can you tell from the picture what the range of that missile is?

General GAVIN. We can make an estimate of the range, and it would be in the order of about 25 miles or so.

Mr. WEISL. Have we anything like that type of launching equipment in our army or in any of the services?

General GAVIN. Yes, we have launching equipment somewhat like that. I would say we have done quite well in the surface to air field, compared to the Soviets. However, this is what they choose to show us.

Senator SALTONSTALL. Did you say that was ground to air?

General GAVIN. Yes, sir.

Senator SALTONSTALL. Ground to air, not ground to ground?

General GAVIN. No, sir, ground to air.

This is quite significant because it is a ground-to-air missile which we have not seen before, Senator Saltonstall.

Next please.

Senator BUSH. Could I ask a question there, Mr. Chairman. Is that missile there a what you call a guided missile or ballistic missile?

General GAVIN. That is a guided missile.

Senator BUSH. Guided missile.

General GAVIN. Now, of all the missiles, I suppose that those that impressed us most are those we will have to fight in the Army. We have deployed overseas troops in armies now, and as a former member of the Seventh Army, I am most grateful for your kind comment, Senator Bush. But it faces us. Here is a tracklaying launcher with a missile aboard. That long-shaped onion shape nose, with motor and fins could have a nuclear warhead. It is a mobile rocket, somewhat on the order of the Honest John.

RUSSIANS, 50-MILE MISSILE ROCKET HAS EXCELLENT CAPABILITY

Next, please.

This is a rocket of about 50 miles range. In the front you see a screen that apparently is designed to protect the nose when traveling through woods and brush. Around it is a blanket which suggests a solid propellant with a temperature sensitive motor and needs temperature control around it. The nose, too, needs particular attention. That screen was not around the nose of the shorter range rocket. This is about a 50-mile rocket and it would be exceedingly useful in a division, certainly much longer than anything we have in the Infantry division today.

Next please.

This is about a 100-mile rocket, again you see the characteristic shield to protect it. The launcher is aboard, the cabin underneath for the crew, and I would presume some check-out equipment. This, too, is very original. Note that it is also a tracked vehicle.

Incidentally, the one I described as similar to our Honest John is on an amphibious launcher and can cross rivers and lakes and the like, which is very good for a missile of that type.

Next, please.

Senator SYMINGTON. May I ask a question for clarification? Is this Russian equipment you are showing us?

General GAVIN. Yes sir; this is Russian equipment.

Senator SYMINGTON. Thank you.

General GAVIN. They have kept this equipment, as a matter of fact, within the Soviet geographic area. It has not been seen in the satellite areas and we have not seen it until they chose to show it to us.

It is interesting, too, they did not show us any of the associated ground equipment such as radars and computers and equipment that must go along. They just paraded these missiles.

Senator JOHNSON. What did your intelligence say about this? Did we have reports of this before they chose to show it to us?

General GAVIN. We knew they had a family of missiles in these categories. I was personally surprised by the efficiency, uniqueness, and design in the full tracked gear and the mobility of the system.

WE HAVE NO COUNTER FOR THEIR 350-MILE MISSILE

Senator JOHNSON. So again perhaps we were underestimating?

General GAVIN. Yes; that is true.

This is at least 350 miles in range, a huge ballistic missile, with a full tracked prime mover and crew. Note the field trailer and launcher, to go with the field army.

This particularly disturbs me in my present position of responsibility because our army deployed overseas has neither a missile that can counter-engage this by firing at the sites nor does it have a missile that can defend against it. So defense must now be passive until we acquire a greater capability than we presently have.

Next please.

These are comparable in size to the 280-millimeter gun that we have overseas. You will notice they are on track laying carriers. When these guns passed by the reviewing stand, the announcer speaking in Russian said, "This is our new ramjet artillery." We do not know whether he meant that or not. They may well be. But they are rather extraordinary in their improvement over anything that we have known in the past in the size of the tube on a track laying vehicle, and the suggestion in looking at the lack of heavy recoil there is the suggestion of some sort of unique propulsion system associated with the projectile.

Mr. WEISL. What would the range of that cannon be?

General GAVIN. Sir, I would hesitate to guess on that without going into too much classified material. On analysis I think we could get you a rather good figure, but this gets into ammunition and the gun itself. It is certainly greater than what you would normally get out of a gun of this caliber, in my opinion.

Next please.

These are the more ordinary things. Nevertheless, they show improvement, too. This is the multiple rocket launcher that up to now we have only seen on ordinary trucks, but here they designed a full tracked vehicle for it with a cabin for the crew.

Next please.

This is the new heavy tank. You know the JS-3, the Joe Stalin, was a famous tank. I saw a lot of them in Berlin following World War II, and it was an impressive vehicle of about 60 tons. I must say meeting a 60-ton tank is quite an experience for a combat infantryman. This tank has a 122-millimeter gun. As you see, it is very clean, very sharply angled, and all in all, a very good all around fighting tank. It is known as the T-10, a new heavy tank.

This is a 57-millimeter twin antiaircraft gun.

Now, anybody who has fought antiaircraft guns in ground combat in the past knows that a 20-millimeter flak wagon was a favorite of the Germans against us and very unpleasant to deal with. This jumps to 57 millimeters and is a nice-sized weapon.

Note the turret, clean, a bit of protection with a slope on top, a radio aboard the vehicle, the antenna is sticking up, and all in all it looks like a good fighting vehicle.

Next please.

This is the first view we had of their amphibious infantry carrier. This carries 15 combat infantrymen, is full tracked for good cross-

country mobility and it also swims. Now, they have married a missile to it and it also is a missile carrier for one of the other missiles.

Next please.

THEIR TWIN TURBINE HELICOPTER LARGER THAN ANY OF OURS

And this is the last of the pictures which I have been allowed to bring here. This they did not, of course, have in the parade, but they chose to show it to us about the same time. It is a twin turbine helicopter. It has a payload of somewhere between 10 and 13 tons. It is aerodynamically much cleaner than anything shown us before. Note the molded fuselage about the engines, and up around the nose. It is a very trim looking, efficient looking vehicle, as we can judge. We have movies of it flying, of course. It is, of course, much larger than anything we have.

Our best program so far is a single turbine helicopter. This is a very impressive looking vehicle in this category.

That concludes this.

Senator SALTONSTALL. What would be the range?

General GAVIN. I am estimating, sir, but I would say about 200 miles.

Senator JOHNSON. How does this compare with the new jet model that Bell is producing?

General GAVIN. You mean the single turbine helicopter I mentioned, the H-40? The Army, in fact, has been the sponsor of the development of this helicopter and Army procurement is already well underway. I would say perhaps this is ahead of the H-40.

Senator JOHNSON. What is the speed of this one?

General GAVIN. Again I am estimating, but I would say on the order of about 140 knots. It is very fast. The twin turbines are much faster.

Senator JOHNSON. I flew in one yesterday at 100 miles an hour and they passed me like I was standing still and I asked the speed of it and they said about 150 miles an hour.

Senator BUSH. Do I understand the general has been in Russia and has seen these pieces of equipment shown here?

General GAVIN. No, sir; I have not been in Russia and I did not see this personally. I did make reference to being in Berlin. I occupied Berlin immediately following the war for about 3½ months where I was a member of the Kommandantura and thus in close association with Marshal Zukov and his entourage. I attended reviews with them and saw a lot of their equipment.

Since the war I have been back and spent a year and a half with the VII Corps in the Seventh Army. This was just about 4 years ago; I have been to Berlin and have seen a great deal of their equipment and I am familiar with it, but I did not see these identical items.

Mr. WEISL. These pictures were published, were they not?

General GAVIN. These pictures were published in the American press. People do not pay much attention to it, but I must say we are impressed.

NONE OF RUSSIAN SURFACE-TO-SURFACE MISSILES IN THEIR AIR FORCE

Mr. WEISL. General Gavin, in the interests of security of which you shall be the judge, what other equipment, in the area of missiles does the Russian Army to your knowledge possess?

General GAVIN. Well, the Russian Army possesses a family of surface-to-surface missiles, as far as we know, out to, well, they have announced an ICBM range which we, I believe, have accepted. All missiles except those in the Soviet Navy are in the Soviet Army.

Mr. WEISL. None of the missiles are in the Soviet Air Force?

General GAVIN. None, to my knowledge.

Mr. WEISL. Now, based upon your knowledge and information of what the Russian Army possesses, what capabilities do the Military Establishments of the United States possess, in your judgment, again within the limits of the national interest, to meet that capability, either in an all-out war or in a limited war?

General GAVIN. Well, let us take the second first, that is, the short close engagement and to which you refer as a limited war, the tactical engagement. We have a very fine Army deployed in Europe, the Seventh Army, and the Eighth Army in Korea. They are well equipped, as well equipped as our present program will allow us to equip them. I think that these armies are facing a very tough and ready foe as these pictures will illustrate.

In my personal opinion, this equipment is superior in a number of respects to equipment now in our armies deployed overseas.

Mr. WEISL. Is our Army working in research, both basic and applied, to build better weapons?

General GAVIN. Yes, we are.

Mr. WEISL. Are you satisfied with the speed and the development?

General GAVIN. No, sir, I am not satisfied. I am not satisfied for the reasons that General Taylor said that a chief of staff is never satisfied. I am just not satisfied because I feel we could have done more than we have done.

Mr. WEISL. Can we do more now?

General GAVIN. Yes, we can.

Mr. WEISL. What can we do more?

ACCENT ON BALLISTIC MISSILES HAS HURT OTHER PROGRAMS

General GAVIN. Well, we could really accelerate the missile program we now have. They have not been moving as fast as they should move. Because of the need to support the big ballistic missile program such as the Jupiter we have had to cut back on the other things such as a new family of tanks.

Just for example, and I did not mention this point when showing pictures, these tanks have compression-ignition diesel engines providing ranges of around 140 to around 170 miles. Our tank ranges are down around 90 miles, and they have carburetion systems—we must get on with new engines. Of course, this is a very dynamic field. You get a new engine or a new gun or a new tank configuration and by the time it gets into the inventory, just like other things, obsolescence faces us and you should be getting on to something else.

So I think we should put more of our national resources than we have been putting into support of our military programs.

Mr. WEISL. Would you recommend to this committee that they see that we take some steps to see that would be done?

General GAVIN. Anything that could be done to get something done about it would be helpful.

Mr. WEISL. Could you be more specific in what this committee in your judgment ought to recommend?

General GAVIN. Well, sir, I would presume that the committee, upon amassing the great deal of information that will come to it, will come up with recommendations that will accomplish some of these things. It is a very, I would say, deep-seated problem. It involves, first of all, better military and professional military advice going to the Secretary of Defense, in my personal opinion.

Mr. WEISL. Has he got that type of professional and military advice now?

General GAVIN. No; and those words I would choose carefully. He has received good advice but I would not say professional military advice.

Mr. WEISL. General Gavin, could you be a little more specific?

General GAVIN. Well, I will be. Let us put it this way, if I may, and what I say is not in any sense intended to be critical of the existing Department of Defense nor the very able public servants who work in it. In fact, I might say that since I have been over there, people like Dr. Furnas for example, or Murphree, our missiles czar, are some of the most able men I have met in my life.

Mr. WEISL. They are no longer there, though.

General GAVIN. No, sir, they have moved along, but you have a problem, and this is entirely a personal opinion of mine, something like this: Let us take as an analogy General Motors, and take the top management completely out. Ship it all away and scatter it to the winds. Then bring in a vice president from General Foods, and someone from Karo sirup and someone from Endicott shoes, and someone else and put them all together, extremely intelligent men, able men and dedicated men and say to them, "You are going to run General Motors from now on."

Well, Oldsmobile comes in, Buick comes in, Chevrolet comes in and they all make their bid. They want things to be done that way. Things get tight and the money gets tight and things get worse and decisions will be made to hurt these companies, and the top management will have a very difficult time to make decisions. The best thing they can do is form a lot of committees bringing people up out of the corporation and bringing in a lot of outsiders who presumably know a lot about running GM, and these experts then try to solve the problems. But all in all, it is an exceedingly difficult thing.

If this is true in the case of the automotive industry, imagine how difficult it is in something as complex as the military services today. The Air Force problem is exceedingly complicated. Worldwide, it ranges from large bombers and fighter-interceptors to missiles, depots, the schools, bases. The Navy likewise: submarines, carriers, carrier task forces, the fleet in the Mediterranean, the fleet in the Pacific—this whole thing. And the Army with its extensive problems.

For one man and one group of men to run this without getting professional military advice from the people in those services is just about impossible in my opinion.

SECRETARY NEEDS MORE ADVICE THAN CHIEFS GIVE HIM

Mr. WEISL. General Gavin, doesn't the Secretary of Defense have the advice of the Joint Chiefs of Staff?

General GAVIN. Well, yes, he does, of course.

Mr. WEISL. In your opinion as a fighting soldier, and a man that I greatly admire, and everybody on this committee and in the country also, I am sure, is it your considered opinion that this is not the kind of advice or that this is not the ultimate advice that the Secretary ought to have.

General GAVIN. Oh, of course, I would say that is right.

He needs more advice than the Joint Chiefs of Staff give him, I am sure of that.

Mr. WEISL. Well, he has no other advice, has he, in military matters?

General GAVIN. Well, he has a very able group of Assistant Secretaries who can give him advice.

Mr. WEISL. Yes, but they are civilians, they are not military men.

General GAVIN. Some of them may have military background.

Mr. WEISL. What is the average tenure of these Assistant Secretaries?

General GAVIN. Sir, I am not sure but I think statistics have been developed on this somewhat on the order of a year and a half, something of that sort.

I think this is rather close.

Mr. WEISL. Well, do you consider that a turnover of a year and a half in Assistant Secretaries leads to a sufficiently experienced group of advisers for the Secretary?

General GAVIN. No, no, I will get right to the point, Mr. Weisl. This is my personal opinion but many people will agree with me on this.

I think really what is needed now is a competent military staff of senior military people working directly for the Secretary of Defense.

I would have them, and again this is entirely my personal opinion, take over the functions of the Joint Chiefs of Staff.

I would have the military staff so organized to handle operations, plans, intelligence, and in fact break up the Joint Chiefs of Staff.

Mr. WEISL. You heard what the general testified to, Mr. Chairman.

Senator JOHNSON. I heard considerable.

Mr. WEISL. The General testified that in his opinion he would break up the Joint Chiefs of Staff, into units, I suppose they would have command of their respective military forces.

General GAVIN. Well, the Chiefs of Staff, of course, will remain with their own services.

INDEPENDENT MILITARY STAFF RECOMMENDED

Mr. WEISL. And have an independent military staff to advise the Secretary, is that what you are saying?

General GAVIN. That is correct, sir.

Mr. WEISL. Where would this independent military staff come from?

General GAVIN. Well, the members of this staff should be picked from the Armed Forces based upon their background, which should show, as individuals, a good record of schooling, and ability to get

along with other services by having served in the field, in overseas commands and other places where we have joint or unified command. They should be outstanding individuals of senior grade and by senior grade I am talking about 3- and 4-star flag officers or general officers brought up and then put into a staff that is completely integrated across the board.

Mr. WEISL. And would this staff never return to its original service?

General GAVIN. Well, I would say their seniority would be such at this time that it would be somewhat unlikely that they would come back to their service.

Chances are those people would be the ones who would go out ultimately to lead a higher command overseas and the likes of that, but there would be no reason why they could not come back.

This would do a number of things:

First of all, the services would feel that they were getting good representation of their own professional points of view in the top councils in the Department of Defense.

We have staffs organized like this. General Norstad has one in Europe now.

We have staffs in the Far East like this, and so on, and thus this type staff would tend to minimize a great deal of the so-called inter-service controversy you now have in that you get better representation and in any case more satisfaction on the part of the services they would be getting more representation.

Mr. WEISL. In a general way this independent professional staff would be a sort of career staff in that particular capacity.

General GAVIN. Well, I would say that after a certain point in an officer's career it would be so.

That is, as an individual showed ability to move into a staff of this sort perhaps in the senior field officer grade around the grade of colonel then he would be earmarked as a potential top staff officer; a unified top staff man.

Mr. WEISL. Did you read the letter sent by Secretary Lovett to the President, after he resigned as Secretary of Defense in which he recommended a staff similar to the one that you recommend?

General GAVIN. Do you know, Mr. Weisl, you mentioned this about a week ago and I did not get to read it until this afternoon.

I read it this afternoon.

By coincidence I had made up my own mind prior to that reading of it.

Mr. WEISL. I would like with the permission of the chairman and the committee to place that letter in evidence.

Senator JOHNSON. Without objection, it will be incorporated in the record at this point.

(Secretary Lovett's letter is as follows:)

THE SECRETARY OF DEFENSE,
Washington, November 18, 1952

THE PRESIDENT,
The White House.

DEAR MR. PRESIDENT: Some months ago in connection with a discussion of means by which my successor could be provided with a running-start on certain of the administrative and operational policy problems in the Department of Defense, you suggested that I write you an informal letter indicating subjects or general areas where work already begun might be profitably continued by the new administration. You mentioned that what was wanted was a paper which

would express my personal observations and that its form need not be that of a properly coordinated staff study but could be more in the nature of a series of notes which might be expanded in conversation or by reference to Department of Defense files if the subject appeared interesting or helpful.

Accordingly, I am setting out below a series of notes on a variety of subjects in which the Office of the Secretary of Defense has or should have special concern. I will try to make them as brief as possible, but one or two of the points discussed are so controversial that they will need some moderate, factual expansion here.

At the outset it would perhaps be well to state in very broad terms my own general feeling about civilian-military relationships, with a word in passing on the quality of our professional military personnel and their permanent civilian counterparts. This will permit anyone who may read this letter to take into account some of my personal beliefs so that he may adjust for them.

In my opinion, the quality of our professional military officers and the permanent civilian staff is remarkably high. It compares very favorably with any large industrial organization of its approximate size, complexity and wide range of functions. I have great respect and affection for our professional military men and having had an opportunity of seeing them both at the council table and in the field, I know of no country more fortunately situated in this respect than ours.

The permanent civilian staff, consisting mainly of specialists in numerous fields and administrative personnel, has shown faithfulness, reliability and a sense of responsibility of the highest order. In technical, financial and industrial matters I have great regard for their competence and I feel that they provide about the only continuity in the over-all Military Establishment.

Since "unification" is necessarily evolutionary, improvements should be made as experience is gained. Neither the framers of the National Security Act nor any of the Secretaries of Defense can see very far into the future, and while much has been accomplished, much remains to be done in order to provide a more efficient and economical form of national security.

(1) General

(a) The primary purpose of the Department of Defense is, of course, to protect and defend this country. This duty may involve fighting a war. If this becomes necessary, the duty of the Department of Defense is to fight a successful war.

Our objective, however, is to avoid war, if possible. An adequate force ready for immediate defense and prompt retaliation against any aggressor, serves as a deterrent to a potential enemy. The better equipped the Department of Defense is to fight, the better it serves its role of a deterrent to war.

(b) In the event of war, an essential job of the Secretary of Defense and his colleagues, both military and civilian, will involve "distributing shortages" among Army, Navy, and Air Force. Based on past experience, these shortages will involve manpower in bulk and critical occupational specialty; materiel in all its forms; land, water and air transportation; communications facilities; funds; industrial and military facilities and so forth.

(c) Under the present Act, and in the event of war, I believe that the present system of controls provided in the legislation for the exercise of authority by the Secretary of Defense in some areas, will prove to be inadequate. This is so because one of the principal elements of control lies through the budget process, the dollar being the single common-denominator of all requirements. This is, of course, supplemented by control of manpower in bulk although military manpower ceilings for all three Services are currently set by the President and by the Congress.

In the event of war, the dollar control will become especially weak and I believe that better controls must be provided. Some of these will be touched on later in this letter.

(d) The present National Security Act, as amended, requires the Secretary of Defense to make use of inter-service Committees for much of his "staff work" and prohibits him from having a military staff. In time of war, the Secretary of Defense would, therefore, find himself unable to handle the distribution of shortages in an efficient and direct fashion.

It would in these circumstances be necessary, I believe, to undertake a reorganization which would not only seriously disrupt the effective prosecution of the war but which could not even start until the necessary authority was secured from the Congress.

(e) I conclude, therefore, that we should not deliberately maintain a Department of Defense organization which in several parts would require drastic reorganization to fight a war. As I see it, this reorganization can be made in an orderly fashion under the present workload without too much difficulty.

A few of the more important areas requiring attention are mentioned below in paragraphs #2, #3, and #4.

(2) *Secretary of Defense*

The National Security Act of 1947, as amended in 1949, strikes a compromise in many important areas. It has the fault of all compromises and while the amendments materially improve the Act, there are still contradictions and straddles in it.

I believe that the position of the Secretary of Defense, in relationship to the President and the Joint Chiefs of Staff, could, with benefit, be clarified. The Act states that the Secretary of Defense is to be "the principal assistant to the President in all matters relating to the Department of Defense." Under the direction of the President and subject to the provisions of the Act, he has "direction, authority and control over the Department of Defense."

The Joint Chiefs of Staff, according to the Act, are "established within the Department of Defense" and shall be "the principal military advisers to the President, the National Security Council and the Secretary of Defense" and "subject to the authority and direction of the President and the Secretary of Defense," they shall perform certain specified duties.

The question is occasionally raised by legal beavers as to whether or not, in view of vagueness in the language of the Act, the Joint Chiefs of Staff are directly under the Secretary of Defense. In my experience with the Joint Chiefs of Staff this problem has not arisen, not only because of the attitude taken by the President but also that of the Joint Chiefs themselves.

While, in my opinion, the authority granted the Secretary of Defense is superior to any made to the Joint Chiefs of Staff, since he is "the principal assistant to the President in all matters relating to the Department of Defense," whereas the Joint Chiefs of Staff constitute an element "within the Department of Defense." It may be well to remove by legislative amendment this area of possible debate. If further clarification of the Act by legislation is not considered desirable, I am of the opinion that the President can clarify the matter by a simple directive.

Another problem which will be referred to in more detail under the notes dealing with the Munitions Board, arises out of possible confusion in the Act which provides that the three Military Departments shall be "separately administered," while at the same time providing that the Secretary of Defense shall be head of the Department of Defense which shall have within it the three Military Departments over which the Secretary of Defense shall have "direction, authority and control." No great difficulties have been encountered because of this straddle, except in the field of supply warehousing and issue, where certain ardent separatists occasionally pop up with the suggestion that the Secretary of Defense play in his own back yard and not trespass on their separately administered preserves. I feel that the Secretary of Defense clearly has authority to step in where necessary in these fields, provided he does not transfer, reassign, abolish or consolidate any of the "combatant functions assigned to the Military Services by the Act.

(g) However, to avoid a waste of time in arguments, it would be well, I think, to have this clarified definitively and I believe that it could be simply done by following the procedure already favorably acted upon in the case of other executive agencies through adoption of the recommendation of the "Committee on Organization" looking toward correcting the present diffusion of authority and diffusion of responsibility in certain executive departments. Under reorganization plans previously submitted to the Congress by the President, all functions of all other offices of a department and all functions of all agencies and employees of a department are transferred to the Secretary of the Department with exceptions, if necessary. The application of this approved procedure to the three Military Departments or the Department of Defense could neatly cure such questions and I believe it should be considered.

(3) *Joint Chiefs of Staff*

The statutory responsibilities of the Joint Chiefs of Staff indicate, in my opinion, one of the principal weaknesses of the present legislation. These weaknesses are common to the three Statutory Agencies placed in the Department of Defense, namely, the Joint Chiefs of Staff, the Munitions Board and the Research and Development Board. In consequence, some of the general observations regarding the problems of the Joint Chiefs of Staff are equally applicable to the Munitions Board and the Research and Development Board and some comments regarding the latter two are valid with respect to the Joint Chiefs of Staff.

In brief, the weaknesses stem from (1) excessively rigid statutory prescriptions of functions, (2) rigid statutory composition which makes the agency, in effect, an Interdepartmental Committee, and (3) the requirements in the statute that each agency perform functions inappropriate, if not actually impossible, for an Interdepartmental Committee to perform efficiently and expeditiously.

One of the most important issues which was compromised in the National Security Act, as amended in 1949, is the position of the Joint Chiefs of Staff. I do not consider the present organization adequate, not only because it leaves certain responsibilities obscure but also because in its present form it does not provide the type of military guidance needed if the full benefits of unification are to be attained.

The problem of the proper set-up of the Joint Chiefs of Staff is the most difficult and delicate one in the field of our national defense structure since it involves the striking of a proper balance between civilian and military control. It is clear that overall "civilian control" is essential and that it is fundamental to our form of government. Yet civilian judgment must be based on adequate military advice given by professional military men in an atmosphere as free as possible from service rivalries and service maneuvering.

The President, the National Security Council, the Secretary of Defense and the three Service Secretaries clearly must have proper military advice. On the other hand, they should not, in my opinion, attempt to conduct military operations and they should avoid hampering the military in carrying out their specialized functions assigned to them by law. The most effective work which the civilian Secretaries can do lies, as I see it, in the establishment of policies under the guidance of the President, as Commander-in-Chief, and in the exercise of direction, authority and control of the Military Departments themselves.

(a) By their very makeup it is extremely difficult for the Joint Chiefs of Staff to maintain a broad non-service point of view. Since they wear two hats—one as Chief of an Armed Service and the other as a member of the Joint Chiefs, it is difficult for them to detach themselves from the hopes and ambitions of their own Service without having their own staff feel that they are being let down by their Chief. The maintenance of an impartial, non-partisan position becomes increasingly difficult in times of shortage of either men, money or material. In fact, it is remarkable that the form of organization currently in being has worked so well and it is, I think, a tribute to the quality of the individual involved.

It is extremely difficult for a group composed of the Chiefs of the three Military Departments and charged, with the exception of the Chairman, with heavy responsibilities placed upon them by law with respect to each individual Service (Army Public Law 518, 81st Congress; Navy Public Law 432, 80th Congress; Air Force Public Law 150, 82d Congress) to decide matters involving the splitting of manpower, supplies, equipment, facilities, dollars, and similar matters.

(b) In over-simplified form, one of the major difficulties with the present Joint Chiefs of Staff organization is that they are grievously over-worked as a result of the great volume of papers referred to them for their views. In consequence, they are too deeply immersed in day-to-day operations, frequently of an administrative character, to have adequate time to devote to their major responsibilities—the preparation of overall, joint and combined strategic plans, the development of logistic plans, the review of such plans in the light of the material and personnel situation and the effect of new weapons.

The problem mentioned in (b) above is aggravated by the fact that the Secretary of Defense has no military staff. In consequence, he must refer to the Joint Chiefs of Staff a vast amount of administrative and policy matters, unrelated to their main functions, since he has nowhere else to turn for the development of military facts or to draw on experienced military judgment.

Strangely enough, the fact that the Secretary of Defense is prohibited from having a staff is not generally realized. The prohibition, however, occurs in Section 203 (a) which states specifically that officers of the Armed Services may be detailed to duty as assistants and personal aides to the Secretary of Defense, "but he shall not establish a military staff other than that provided for by Section 211 (a) of this Act." The section referred to is the one which establishes the Joint Chiefs of Staff. In consequence, the Secretary of Defense has no alternative but to flood the Joint Chiefs of Staff with all sorts of papers originating in the three Military Departments, the statutory agencies and the other executive agencies of government and the Congressional Committees.

The reason for this provision is fairly clear in the legislative history and is a derivative of the line of thinking which developed the compromises through fear of the establishment of an "Armed Forces General Staff" which was specifically

prohibited by Section 2 of the Act. As a result of compromise and unnecessary apprehension, we have succeeded in making the Joint Chiefs of Staff a sort of clearing house for papers instead of having them occupy their rightful position and instead of leaving them adequate time for their great responsibilities.

On the point mentioned in (a) above, the fear of an "Armed Forces General Staff" again seems to have dominated our thinking. The broad national service point of view, as compared with the single service point of view, is not merely a problem of the individuals making up the Joint Chiefs of Staff, but is more likely in the Joint Staff which prepares the papers and submits the analyses and studies to the Joint Chiefs of Staff. This staff, by law, consists of officers of approximately equal numbers from each of the three Armed Services. They are of relatively junior grades and their future careers and promotions lie in their separate services. It is not unnatural, therefore, that they should from time to time become the advocate of their own Service's point of view. There is, furthermore, a natural temptation to indulge in the indoor sport of "back-scratching." The Joint Chiefs of Staff have taken great precautions to prevent such occurrences, but until calculating machines replace humans in staff functions, the danger will, I believe, exist.

For the above reasons, among others, I feel that we should profit from the experiences we have had in the last two years under conditions of partial mobilization and warfare. A great deal of thought has been put on the problem and its solution. I am not sure that we have the right answer yet. On the other hand, I believe we can make an improvement in the setup and, perhaps the new President and new Congress should consider some of the suggestions which could be made.

Based on experience so far, I believe that the problem might be solved by a reorganization along the lines of Alternate (I). A more radical, long-term possibility is indicated in Alternate (II), below:

(I) (a) Re-define and clarify the functions of the Joint Chiefs of Staff so as to confine them exclusively to planning functions and the review of war plans in the light of new weapons and techniques, transferring the balance of the present military-staff functions of the Joint Chiefs under (d) below.

(b) The Joint Chiefs of Staff should create a strong planning division which would constitute their principal staff.

(c) It should be clearly understood, by legislative amendment if necessary that, in order to relieve them of certain of their individual operating responsibilities in their several military services, each Chief of Staff has very broad powers of delegation to his Vice Chief.

(d) The balance of the military staff functions should be transferred to the Office of the Secretary of Defense to provide him with a combined military-civilian staff. This staff would be responsible only to the Secretary of Defense, and through him to the President, and the efficiency ratings and promotions should be controlled by him. Adoption of a procedure similar to the method which the Army has long used to protect General Staff Corps officers would seem adequate. This would appear to involve an amendment to the Officer Personnel Act as presently in force. This staff would aid the Secretary of Defense in acting upon such matters as resolving conflicts between Services and aid him in matters involving policies regarding budgets, procurement, logistics, manpower, personnel, intelligence, etc.

(e) The Joint Chiefs of Staff should not "operate" or "command," except in time of war and then "by direction." Unified commands should be established by the Secretary of Defense, with the advice of the Service Secretaries and the Joint Chiefs of Staff, and should be assigned to a military Department as the Secretary of Defense's agent, if necessary, and not to a member of the Joint Chiefs of Staff in his other capacity as the Chief of a Service. Flexibility is required in this field in order to deal with different situations as they may exist. The Act currently makes possible the violation of the principle of civilian control by leaving it confused as to whether, in the case of unified commands, the theater commander reports to the Joint Chiefs of Staff or the Secretary of Defense. In my opinion, the Secretary of Defense, as the "principal assistant to the President in all matters relating to the Department of Defense" should, in effect, be the Deputy of the Commander-in-Chief and, therefore, any unified command should be established by him, report as directed by him and, similarly, receive orders by his direction.

Since any unified command has functions broader than a single Military Department, it would be well to review, as part of the study of the Joint Chiefs of Staff, the present directives of unified commands to disclose their strengths and weaknesses and to find ways to improve them, if necessary.

The above very condensed outline may serve to indicate certain steps which, by a mixture of legislation and administrative action, would, I think, substantially improve the present efficiency of the Military Establishment. They represent only indications of methods, and the exploration of them should, in my opinion, be continued energetically in the hopes of arriving at a sound conclusion.

(f) The Chairman of the Joint Chiefs of Staff should be given a "vote." While the "voting" procedure is not normally used, the Act denies the Chairman a "vote." It is perfectly obvious that he will have, or should have, some opinion on the matters which come before the J. C. S. for discussion and it is unrealistic to assume that the Secretary of Defense will not ask his opinion or that he will not give it. The Chairman of the Joint Chiefs of Staff is the only member who is not directing a particular Service. He is the military officer to whom the President and the Secretary of Defense must look for the organization and evaluation of military judgment. He should not, however, be given the power of decision, which must remain in the President and the Secretary of Defense if civilian control is to be maintained. But the Chairman must be a participant in the discussions, looking toward unanimity of opinion on a course of action, or failing to get unanimity, he must identify the differences of opinion and submit the various points of view, together with his own, to the Secretary of Defense for decision.

(II) An alternative approach which might provide a solution would require a series of evolutionary steps and the adoption of a system, all the implications of which I have not adequately thought out. It would involve a change in the make-up of the Joint Chiefs of Staff by having its membership consist of senior officers who have served as Chief of Staff of one of the three Services and who immediately upon completion of such duty becomes a member of a Combined Staff. The divisions of this staff would consist of functional staffs of professional military officers in the field of strategic planning, logistic planning, military requirements and overall military policies. This group of officers would have a separate promotion system and would be accountable only to the Combined Staff, the Secretary of Defense and the President. There would be no single Chief of Staff and the Chairmanship might rotate. It must be recognized, however, that the concept of this staff appears to run contrary to the prohibition contained in the National Security Act of 1947 against an "Armed Forces General Staff." Under this form of organization, the Secretary of Defense would continue to need a staff of his own for the purposes indicated in (d) above.

The establishment of any unified staff along the above lines would require the development of a system to provide properly trained personnel. This process would take several years to develop and perfect, since it would seem to require additional specializations in certain scientific, technical, and industrial fields.

It is my present opinion that this alternative approach, even if it should be found to be promising, involves too abrupt a change from the present system and that it might be disruptive. It would, in any event, require several years of preparation and careful study. I conclude, therefore, that the more moderate reorganization in Alternate (I) is preferable at this time.

(4) Munitions Board

This Statutory Board, with built-in rigidity under the existing Act, will not in my opinion, be able to perform adequately in time of war the various functions presently assigned to it by statute. There are three principal inadequacies in its organization.

First, the membership of the Board, prescribed by law compels three of the four members to sit as judges on their own requests and to pass on estimates of production, on schedules and on procurement and distributing systems for which they are each responsible in a separately administered service. They are thus in the position auditing themselves, consolidating themselves, and passing their own plans. Even with the exercise by the Chairman of the power of decision delegated to him by the Secretary of Defense, the difficulty is not solved.

I believe that real flexibility in the makeup of the Board is needed and the selection of the Board should be left to the Secretary of Defense in order to permit the inclusion of a number of men of broad industrial, engineering, scientific and general business background, as required.

Secondly, the military advisers of the Board and the military members of the Board's combined military and civilian staff can be subjected to pressure by their branch of the Service because of the control of fitness reports and promotions by their services. While every effort is made to protect the officer in the exercise of his independent, professional judgment, many competent officers try to avoid this type of duty lest they be put in the position of serving merely as a watchman

over the interests of their Service. This problem and its cure is about the same as in the Joint Staff.

Thirdly, the duties assigned to the Munitions Board by the Act are confused by the apparent emphasis on the planning aspects of procurement, production and distribution problems associated with industrial mobilization, thereby permitting technical challenges of the validity of its decisions by doctrinaire proponents of "separate administration." This problem was briefly discussed in connection with the powers of the Secretary in paragraph (2) above.

The suggestion has been made that in the interest of clear lines of authority and responsibility, the Munitions Board be abolished and that its functions be transferred to the Secretary of Defense by an amendment to the existing statute which would, in addition, direct the Secretary to Establish a Munitions Advisory Board. While the present powers of the Secretary of Defense are adequate, in my opinion, to appoint an Advisory Board without specific authorization, it might be well to mention this area of activities in any amended legislation. Under this approach to the problem, the Chairman of the Munitions Board should be replaced by an additional Assistant Secretary of Defense.

The cure for the problems presented by the rigidity of organization and over-specification of functions of the Munitions Board and the Research and Development Board, which suffers from similar ills, does not appear to be difficult. It does, however, require legislative action to permit the administrative reorganization.

(5) *Organization of the Armed Services*

The organizations of the Army, Navy and Air Force are all different. The responsibilities and authorities of the Chiefs of Staff of the three Services differ. Their present organization follows a pre-unification pattern and some parts are fixed by law while others are not.

It would be well, I think, to have a thorough-going functional and organizational study of the three Military Departments, now that they are part of the Department of Defense, to determine the good and bad points in the organization and to take common advantage of the best features of each Service.

As an indication of one area in which modernization and improvement appears to be needed, consider the "technical services" organization in the Army. There are seven technical services in the Army—Corps of Engineers, Signal Corps, Quartermaster Corps, Medical Corps, Chemical Corps, Transportation Corps, and Ordnance Corps. Of these seven technical services, all are in one degree or another in the business of design, procurement, production, supply, distribution, warehousing and issue. Their functions overlap in a number of items, thus adding substantial complications to the difficult problem of administration and control.

It has always amazed me that the system worked at all and the fact that it works rather well is a tribute to the inborn capacity of team-work in the average American.

One result of this type of organization is to form a "service" on the basis of a profession rather than on the basis of its functions. In other words, let us say that civil engineers are in the Corps of Engineers; electrical and communication engineers in the Signal Corps; mechanical, industrial, hydraulic, ballastic engineers are in Ordnance, etc.

A reorganization of the technical services would be no more painful than backing into a buzz saw, but I believe that it is long overdue. I have a memorandum outlining one method of reorganization which looks promising. The study is recent and was completed in September 1952.

(6) *Headquarters Structure*

The problem of the number of Headquarters in the field as well as in the zone of the interior is steadily growing. It is aggravated by the requirements imposed by the activities of the North Atlantic Treaty Organization, but it existed prior to the formation of that body. There are, in my opinion, far too many levels of headquarters in the Military Services thus adding to the overhead and inevitably causing delay. Furthermore, each headquarters sets up a chain reaction of demands for housing, transportation, etc., thus adding to the cost. Special groups have been investigating this area for some time in connection with the utilization of manpower and I think the effort to reduce the number of headquarters must be given every assistance by the senior Defense officials.

I have a similar feeling about the number of Committees. This matter is not so much in the control of the Military Departments as Headquarters are, but the formation of Committees is a very contagious virus which has the unpleasant characteristic of rapid reproduction.

(7) Personnel

Intensive study has been given to the problem of personnel over the past two years, with particular emphasis on the reduction of non-combat personnel wherever it can be done without impairing the combat efficiency of the troops. Our basic doctrine which emphasizes fire power and the self-sufficiency of our divisions so that they may continue in efficient combat over long periods of time, obviously requires very substantial supporting troops, not only in the rotation of men but in a constant and reliable system of supply. While considerable progress has been made, there is still much room for improvement, and the Manpower and Personnel Section of the Office of the Secretary of Defense is cooperating fully with the independent Citizens Advisory Commission on Manpower Utilization in the Armed Services, appointed upon the recommendation of Congress. A distinguished group of civilians on this Commission will devote its attention to the very important area indicated by their title and improved methods and savings are reasonably to be anticipated.

However, even if theoretical perfection were obtained in the fields of personnel use mentioned above, we would still be left with the problem of reducing the annual fixed costs of the Military Establishment to be maintained over a period of years. One of the most promising areas of reduction of cost lies, in my opinion, in keeping the standing military forces to a minimum to protect against disaster while having immediately available a basically trained Reserve. The only satisfactory method of accomplishing this desired result, that I am aware of, is through a system of Universal Military Training and Service. I believe that steps should be taken promptly to make this system effective.

(8) Legislation on Official Secrets

One of the great hazards to national security lies in the apparent inadequacy of existing legislation to protect this country against traitors, spies and blabbermouths. The problem is not one peculiar to the Department of Defense and perhaps matters of this general sort might lie more appropriately in other agencies of Government. However, this problem is not a new one, and it was, in fact, raised by Secretary Forrestal. I mention it again as I feel that it is a subject of cardinal importance and should receive prompt action.

(9) Non-defense Activities

There is one final, overall impression which I have and which I feel is worth mentioning. There is a natural tendency during periods of military production and mobilization activity to hang all kinds of appendages on the Department of Defense. Sometimes this is done because the Military Establishments are 24-hour-a-day operations and have trained and capable personnel; but sometimes the attachments are made to bring the functions under the umbrella of "military necessity." Whatever the reason may be, I feel that the Department of Defense is so large, its responsibilities are so great and its operations so world-wide that additional functions should be placed in this Department only as a last resort.

* * * * *

All of the above subjects are matters which I have discussed with you from time to time during the past year and represent, with particular deference to the Office of the Secretary of Defense, the Joint Chiefs of Staff and the Munitions Board, organizational problems which you requested me to study and report to you on by 1 December. There is ample room for difference of opinion between reasonable men on my comments on these difficult subjects, especially since they represent views based largely on personal experience. I offer them, therefore, without any missionary zeal and only in the hopes that they may save the time of my successor. Another person, with different work habits, might find other problems or apply different emphasis to these. I believe, however, that progress will be made in some of these areas only by trial and error and that we can improve vast organizations such as the Department of Defense only by constant review.

There are, of course, countless other matters which my successor should be informed of and to which he should give early consideration. Most of them, however, involve matters of military security and should, therefore, be dealt with under the usual classified material procedures. I will do my utmost to see that my successor is fully briefed on all such matters and I will gladly hold myself at his disposal for any assistance I can give in making his takeover of responsibilities smooth and effective.

With great respect, I am,
Faithfully yours,

ROBERT A. LOVETT

Mr. WEISL. Would you like to comment on Secretary Lovett's recommendation in that regard, as it relates to the recommendation that you are now making?

General GAVIN. Well, now, sir, again I did not read that letter until this afternoon and from my first reading of it I thought it was a very good and a very fine letter.

It made some good points.

HIGH COMPLIMENT TO NEW SECRETARY OF DEFENSE

Mr. WEISL. Have you any other suggestion to make to this committee, General Gavin, with respect to the efficiency of the Department of Defense so they can build missiles, satellites and so forth more quickly and have a more forward-looking program for future weapons?

General GAVIN. Well, it seems as clear to me as anything I can think of that we must get better military advice to our Secretary. I think that we have today in the Secretary of Defense the most able man who has come to that office; in my personal opinion, an extremely able man.

As in an industry or anything else, the right people are necessary. No organizational structure can make something if you don't have good people in it.

Senator JOHNSON. How long have you known the present Secretary of Defense?

General GAVIN. About 4 months and during that time I spent a week with him, before he came to office, visiting a number of facilities in the Department of Defense.

I had a number of opportunities to talk about his problems at that time.

Senator JOHNSON. That is a very high compliment you pay him.

General GAVIN. I meant every bit of it, sir.

Mr. WEISL. Are there any other suggestions, General Gavin, that you would make or would like to make to the committee in this connection?

General GAVIN. Of course, the organizational structure that would have to have good people in the right places and have adequate funding; adequate funding in basic research as well.

Both are important.

Mr. WEISL. Have you any suggestion as to the elimination of committees?

General GAVIN. This would eliminate many of the committees that now exist.

Mr. WEISL. How does the present Secretary get advise on military or procurement matters today?

General GAVIN. Well, sir, I have—

Mr. WEISL. I don't mean as an individual, but what access has he to the advice?

General GAVIN. Having spoken so highly of him, I am sure that he can present his own point of view in a very effective way indeed.

Mr. WEISL. I am not talking about his personal point of view but under the system that exists.

General GAVIN. Well, he has a Deputy Secretary, and a number of Assistant Secretaries and they in turn have staffs working for them and then there are quite a few Department of Defense committees.

From all of that advice comes to him, to the top of the pyramid.

WOULD RESULT IN SIMPLIFICATION OF PENTAGON STRUCTURE

Mr. WEISL. Do you believe that if this career staff or professional staff, or whatever you call it, were instituted to give independent advice to the Secretary a great deal of these committees and the complex structure of the Defense Department could be eliminated?

General GAVIN. Yes; I do.

Mr. WEISL. You think the work could get on quicker?

General GAVIN. I do, sir.

Mr. WEISL. Have you any suggestions, General Gavin, as to how we can speed up research so that as weapons become obsolete we are ready or as ready as one can be, with new weapons.

General GAVIN. Well, of course funding is very important.

One of the problems that we have been through in the last 3 years is that of being unable, despite the soundness of the proposal, to persuade the Department of Defense that the proposal had, in fact, merit.

The Armed Forces are always accused, or frequently are, of preparing for the last war rather than the next.

I have found to my great disappointment when I have arrived in the position in which I am supposed to do some of this preparing, that it is exceedingly difficult to prepare for the next war because it is difficult to get a new idea across.

With the type of professional staff which I have recommended, you would get more understanding, more acceptance and as a result better advice going to the Secretary of Defense.

Mr. WEISL. I don't know, General Gavin, whether you were present when I read the letters from scientists, technologists, and manufacturers of weapons in which they lodged certain complaints as to the slowness and the lack of long-term planning, et cetera.

General GAVIN. No, sir, I was not present, I did not hear that.

Mr. WEISL. You were not.

Now, you are familiar with the decision made by the Department of Defense to put into production both the Jupiter and the Thor missiles?

Again without violating security, do you think it is proper to tell the committee the Army's view on mobility in connection with such missiles?

General GAVIN. Well, sir, I noted what General Taylor said about mobility and of course I agree with him entirely.

We think in terms of mobility.

Mobility is one of the functions of survival in combat.

Whether you are an individual, or 10,000, if you don't move you don't live long, and whether it is some missile unit or anything else it has got to move; mobility is one of the essentials.

You could build an armadillo with a great defensive capability but, if it could not move, it would not be worth much.

We must have mobility in these systems, absolutely.

A FIRST GENERATION MISSILE—MOBILITY WILL COME WITH TIME

Mr. WEISL. General, you have had to fight, you are a fighting soldier and you know what is needed.

Do you believe that these intermediate missiles I have mentioned are mobile?

General GAVIN. Well, certainly the Jupiter is in this concept.

I would say this about it: It is a first-generation missile. I would say to you, gentlemen, that for this range, this is probably the least mobile missile you will ever see because they will become smaller in size, more efficient in handling, have better handling gear, and be more mobile as we go along, but the Jupiter is a mobile system.

Mr. WEISL. You believe that a system could be worked out that could effectively move these—this instrument, this missile?

General GAVIN. Yes, this is being developed this way.

We have never thought of it in any other way.

Mr. WEISL. You are developing the system as far as the Jupiter is concerned?

General GAVIN. That is right, sir.

Mr. WEISL. And you believe that it is very vital and necessary to have mobility?

General GAVIN. Oh, absolutely.

Mr. WEISL. I wish, again not knowing the limits of security as well as you do, if you could within security restrictions explain to the committee why you are so convinced of the need for mobility.

“PEOPLE WHO HOLE UP IN CONCRETE FACILITIES DON'T LIVE LONG”

General GAVIN. Well, I would not want to impose upon the committee and go into a lengthy explanation.

I suppose for someone in the Army it stems from your own experience, and from the beginning of when you learned about these things.

Let us put it this way:

In combat one soon learns that people who hole up in big concrete facilities don't live long.

In Sicily, for example, I recall concrete pillboxes three stories high with floors in them and trapdoors that were pulled up so even that when you overcome the ground floor you still did not have them—you had to work your way up.

Yet fighting them, fighting the people there, once they got into those pillboxes you knew your problem was over then.

You really had them then; it was just a question of time.

You could even go back over to the hedgerow, eat a can of rations, and decide to come back and polish them off when you were ready.

I had a parachute regiment that went into that affair and those people who holed up against us in fixed facilities did not last long. The people who were outmaneuvering us were the ones we worried about.

Toward the latter part of the war, in the fall of 1944, I had a parachute division that went into Holland. We were confronted with some 120 ack-ack emplacements, and there was a great deal of speculation about how they would do, about how they would do with parachutists coming down on top of them and none were very promising predictions.

The choice is very simple. The man being attacked has one choice—to fight there. The one in the position of mobility has the opportunity to think over choices of action. He can probably fight another day. Well, the people in fixed positions did not live long. They were cleaned out.

This has been a fixed pattern of experience.

Once you pin yourself down to a hole in the ground and pull the hole in on top of you, your days are through, you have got to move, you have got to move to survive and we think this is true of ballistic missiles as well as anything else, and the loads are no bigger than we have in the mobile army today.

We have mobile hospitals. We recovered 50-ton tanks with retrievers under fire. Moving ballistic missiles is no problem.

GERMANS' FIXED FACILITIES DESTROYED

Mr. WEISL. In your experience in Germany also in the last war you found that the V-2 weapons of the Germans were all destroyed by the American Air Force when they were on immovable platforms; isn't that right?

General GAVIN. Well, sir, this is the story as I understand it, and I think you have got the man available who knows, Dr. Von Braun. He had to fight that problem.

But as I understand it, talking to him, the reaction of the scientists was to build nice concrete facilities with cafeterias and workshops and bunkhouses and the like of that about, near the launching site.

Whereas the professional military people wanted a mobile system and they decided to compromise and they did not do much shooting off the fixed facilities. These were destroyed.

The mobile systems were completely effective.

Mr. WEISL. General, before we leave and go into the satellite field with which I know you are quite familiar and to which you have given a great deal of thought, have you anything further that you want to say on the questions that were propounded to now?

General GAVIN. No, sir.

Mr. WEISL. Have we covered the ground sufficiently?

General GAVIN. I believe so. I would like to add as a cleanup that the Army believes now, and it always has believed, that all services have requirements for missiles. If there is any way that we can help another service get a better missile, we want to do it and we are trying to do it. This has been our policy right along and we have insisted on this.

Mr. WEISL. You are doing it with the Jupiter, and I understand you are also training men to man the Jupiter?

General GAVIN. Well, that is correct, sir.

We spent, well I have spent about a million dollars and 4 months' delay in helping get the Navy a seagoing Jupiter for awhile, until they later dropped and went to Polaris.

When the proposal was made to do a 1,500-mile missile, as a matter of fact for the Air Force, we offered to, and these are the words, "enthusiastically develop it for them."

We feel strongly about this missile business. We think we need missiles and need them badly, and, as the services have requirements for them, we want to help them get them.

Mr. WEISL. Now you have made a study of the military significance of satellites, have you not?

General GAVIN. Well, in the ordinary course of my work this is normal; yes, sir.

Mr. WEISL. Do you think that from the standpoint of security we ought to discuss your study in open session or not?

General GAVIN. Well, I would say to a limited extent; yes.

Mr. WEISL. Do you believe that the satellite has great military significance?

General GAVIN. Tremendous significance; perhaps the most significant thing of our times.

GIVES SATELLITE HIGHEST PRIORITY

Mr. WEISL. Do you believe the satellite ought to be worked on as effectively and with as high a priority as ballistic missiles?

General GAVIN. I give the satellite higher priority.

Mr. WEISL. Even higher?

General GAVIN. I would.

Mr. WEISL. Please tell us within the limits of security what the military significance and necessities dictate in the satellite field.

General GAVIN. Yes, sir.

May I say why I said "higher."

In the first place, no satellite is any better than the main thrust unit under it.

You cannot get a satellite up without a good engine.

We tend to be reactive in our program.

We tend to look over our shoulder on what someone else is doing and do that sort of thing.

We are on the point now where we had better get out on the curve of progress, very, very far out, and this means getting out to satellites as fast as we can and then bring along with it the propulsion units to get the satellite up.

So I would presume that this would be understood.

Mr. WEISL. You don't believe we ought to wait until we have a stockpile of ballistic missiles before we go to the satellite field; do you?

General GAVIN. We should move along with the satellites on the highest priority and then the ballistic missiles as fast as we can bring them along.

Mr. WEISL. And in order to launch a ballistic missile, as you point out, you must have a rocket engine with a heavy thrust?

General GAVIN. That is absolutely true.

WHAT THE SATELLITE WILL BE USED FOR

Mr. WEISL. Tell us briefly within the limits that you feel necessary, what the military and other significance of a satellite is?

General GAVIN. Well, sir, there are some obvious things.

First of all, you have a vehicle that is flying over land on a predicted orbit, as a regular thing.

It is quite simple to see that this could be a reconnaissance vehicle.

A reconnaissance of the conditions of, let us say, weather; I believe Dr. Teller talked about this.

It can see large weather patterns developing.

It could give you a system of predicting weather changes well in advance of anything now in existence.

It could also do what we refer to as mapping and geodesy, the relationship of the large land masses to each other on the surface of the earth.

A great deal is not known about the interrelationship of land masses, so it could contribute directly to a better understanding of what the earth really is and the dimensions of the earth.

If it could do these things, it could achieve a more sophisticated form of reconnaissance, and it does not take too much imagination to see this, I am sure.

If this is the case, this brings us to the next thing: I would think that it would be in the national interest of this country to have a capability to say that there will or will not be a satellite reconnaissance of the area that concerns us, the Western World or the United States. This suggests at once that you should have a capability of denying satellite overflight, so I am again dealing in a speculative way with a military significance of the satellite.

TRIP TO THE MOON

Mr. WEISL. Dr. Teller testified, I believe, that it was very important for us to reach the moon.

Now, as a practical man, and as a fighting soldier, do you believe that it is vital for the United States to be able to reach the moon?

General GAVIN. Oh, absolutely, absolutely.

Mr. WEISL. Can you tell us why?

General GAVIN. Well, yes.

In the first place, I might say, of course, you know when you deal with problems such as this, it is like Queen Isabella asking Columbus what he was going to find where he was going, when she was trying to pawn the crown jewels, and it was fantastic as to what this country was going to be, and it could not possibly be foreseen.

In the first place, if you are going to the moon you have got to develop a unit that can leave the earth, and this requires a very high propulsion; it requires the solution of many complex, difficult, challenging, scientific problems that all in themselves will contribute a great deal to understanding about the environment of man on the earth.

He will have to travel through the ionosphere and communicate once he is through.

This poses, at once, very complex communication problems.

Next, you will find out about the impact of meteorites and meteoric dust on the object.

You will then begin to find ways of living out there.

There are various ways of getting to the moon. One is to go directly to the moon, and another is to establish a station in space, and then use it as a steppingstone to go to the moon.

So that if you were to establish a planetary vessel in space, a space vehicle, space station, let us say, the establishment and the maintenance of that would provide us with a tremendous amount of information to the betterment of humanity, unquestionably.

Now, then, to go to the moon itself, there are a number of reasons why you should want to go there.

First of all, you have accomplished a great deal in getting just this far, and next it is there, and you want to go there because it is there; you want to see what is there. There is considerable speculation about the body of the moon itself, how dense it is, what the surface of it is, and what it is composed of.

This we would want to find out. We have never seen the far side of the moon, and we are quite curious about what is on the far side, so we would like to get on out and see what it is made of and what conditions are prevalent on the surface of the moon.

Next, we are faced with this problem: If I, as a soldier, were asked by my superiors in this country, is the moon of any significance to us, if the Soviets, for example, are occupying it, I would say absolutely, yes. We have got to get out there. We have got to get out there first, and if they are out there, we have got to have some understanding of who is going to occupy the moon.

You have a problem here of very impressive proportions, in my opinion. You have got to get out there, and get out there first and be able to sit down in international councils and determine as to who is going to be out there and who is to do what out there.

So you have a number of problems, not only the basic international problems, but basic political problems.

Senator JOHNSON. Have you made any plans to go along with Dr. Teller? Are you going to travel together?

General GAVIN. I would gladly join Dr. Teller in any venture.

Well, sir, this, very quickly, has been a rather speculative——

Senator JOHNSON. You make it sound very exciting.

Mr. WEISL. The general is quite serious about this, Mr. Chairman.

Senator JOHNSON. Who isn't serious about it?

Mr. WEISL. Now, the mapping of the earth's surface is important, is it not, in connection with the use of ICBM's?

General GAVIN. Oh, absolutely, I think so. I think this is not well understood.

But, you see, the ICBM suggests to many people that the manned aircraft is no longer effective in that range category.

If this is true, then a manned reconnaissance airplane is likewise no longer effective, and, if this is true, an unmanned reconnaissance vehicle is necessary to match to an ICBM, and this is a satellite.

Senator JOHNSON. You may proceed, counsel.

Mr. WEISL. In your opinion, General Gavin, what are the bottle-necks which impede the missile and satellite program?

LACK OF FUNDS HAS IMPEDED RESEARCH

General GAVIN. Well, sir, I would say that there have been, once the programs have been gotten underway, there have been none in the IRBM programs; and I presume there are none in the ICBM, although I would leave it to the Air Force to talk about that.

In the others; lack of funds.

Mr. WEISL. Sir?

General GAVIN. Lack of funds in the other programs.

Mr. WEISL. Lack of funds?

General GAVIN. Yes.

Mr. WEISL. How about research?

General GAVIN. Yes, sir; in research and in development.

Mr. WEISL. There has been lack of funds in that?

General GAVIN. That is right; yes, sir. They have been funded, but not up to the optimum, and there has been slippage from year to year in some of them, most of them.

Mr. WEISL. Have you any recommendations, General Gavin, to make to the committee for accelerating the program?

General GAVIN. Well, I believe that if the organizational recommendations were adopted that I mentioned earlier, and adequate funds were provided, the programs would move along all right.

Mr. WEISL. Is there anything further that you would like to say, General, that I have not covered?

General GAVIN. No, sir. I am available to you—

Mr. WEISL. Thank you very much, General Gavin.

Mr. Chairman, that is all the questioning I want to do at this time.

Senator JOHNSON. Thank you very much.

General Gavin, I think I should say to you that it has been quite a treat to hear you. You talk like the kind of fellow that I have been looking for ever since we started these hearings, and that is a fellow who thinks that things can be done perhaps a little bit faster and perhaps a little bit better.

I want to explore further with you any possible suggestions you might make to us.

I am convinced that none of the men in the higher echelons in any of our services are unpatriotic; I am convinced they are all dedicated men who want to serve their country as they believe their country should be served. But I am not convinced that they are what I call "can-do" fellows.

I have, in my limited experience, many times encountered individuals who can always find a dozen reasons why something that ought to be done cannot be done today, and I am frightened by, not just the pictures that you have presented, but by the sum total of all the pictures that have come to me, and my information is necessarily quite limited.

Now, General, during your presentation on the Soviet Army weapons, as I recall it, you stated that this is the last of the pictures that "I have been allowed to bring here." Is that correct?

General GAVIN. I do not recall the word "allowed."

Senator JOHNSON. I understood that you said that, and it had more than passing significance.

General GAVIN. Perhaps I used it in the sense that the committee permitted me to bring them. There was no restraint on me.

NO RESTRICTIONS ON HIS TESTIMONY

Senator JOHNSON. I am very glad to hear that.

My next question—we are going to follow through on the picture—have you been restricted in your testimony in any manner, in any form, by anyone?

General GAVIN. Absolutely not; no, sir.

Senator JOHNSON. I am glad to hear that, General.

Now, have you fully considered every possible recommendation that you care to make for putting the missile program back on the track and expediting it, accelerating it? Have you said all to this committee that you think you could say that would accelerate it?

General GAVIN. I believe so, sir.

Senator JOHNSON. Do you believe that Sputnik No. I and Sputnik No. II have capabilities of mapping the earth? You were talking about reconnaissance and the mapping of the earth, and I just wondered what capabilities you felt that Sputnik I and II might have?

General GAVIN. Oh, I don't know, sir. Sputnik I, I doubt. Sputnik II, 1,120 pounds, carries a lot more than a dog. I do not know what else is in it. I do not know that anyone else knows, besides the Soviet.

Senator JOHNSON. You think it is tragic, though, we were not there first?

General GAVIN. Yes, indeed.

Senator JOHNSON. Do you think we could have been?

General GAVIN. Yes, we could have been.

Senator JOHNSON. And the reason we were not—money?

General GAVIN. No, wrong decision.

Senator JOHNSON. What was that decision that was wrong?

General GAVIN. Why was it wrong, sir?

Senator JOHNSON. What was the decision that was wrong? Which decision do you refer to?

General GAVIN. Well, this has been a rather difficult experience, I would say, for the Department of the Army, and I have been personally party to a great deal of the action.

It goes back to the first discussions when Dr. von Braun and the other Army people first worked with the Navy in 1954, the winter of 1954-55.

A number of proposals were worked up and, as you know, sir, the first decision was made in August of 1955 finally—well, the first one, the final decision that the Jupiter C proposal, Project Orbiter as it was known as, would not be adopted as the national satellite program.

On the 15th of August, General Simon, who was Chief of Research and Development of the Ordnance of the Army, sent a paper to the Department of Defense analyzing the Vanguard proposal, pointing out the serious damage that could be done to United States prestige if we did not launch first, and the apparent shortcomings, as he understood them technically, in the Vanguard program. This was the 15th of August 1955.

Nevertheless, the programs went along, and we followed it very closely, and anxious and willing to help.

In the spring of 1956 we made a proposal to the Department of Defense that apparently was considered.

In May of 1956, General Daley, on my right, and Dr. von Braun, made a proposal to the Department of Defense that we go ahead and launch a satellite, and finally on the 15th of May, I believe it was, I received a directive telling me in specific terms that the Army would not prepare to launch a satellite using its Jupiter or Redstone missiles.

Well, we followed the programs quite carefully, the Soviets and our own, and finally in September of 1956, we then launched a missile that was announced as having flown 3,300 miles, and quite a few hundred miles into outer space. That essentially was the configuration that we had proposed using.

Secretary Brucker, a couple of months later after we took quite a bit of time to study it again, reopened the issue and urged that we be allowed to go ahead and provide the country with a satellite, estimating that we could fly one by midsummer of 1957; that is just this past summer. Again it was turned down.

By spring and summer of 1957 I became quite worried about it because I was following the Soviet program very carefully, and they appeared to be approaching the real possibility of launching.

At that time, I asked General O'Meara, my deputy, in June of 1957, to go down and talk to Dr. von Braun about it and ask him what we ought to do next, because obviously we had made about five tries to get started but could not get our programs approved.

In our opinion, the Soviets were getting close to launching; national prestige was going to suffer a serious blow, and we talked to Dr. von Braun about it in June of this year, about where we should go next.

We even talked about the possibility of denying satellite intrusion in the event that it were unusually effective, a military satellite rather than a small, let us say, purely scientific satellite.

Well, on August 26, you may recall Mr. Khrushchev announced that they had fired an ICBM into the target area. His words were very carefully chosen.

We analyzed that, and I became satisfied then that they were on the threshold of launch, because he had achieved a multiple-stage rocket with a good main thrust unit.

ON SEPTEMBER 12 THEY PREDICTED LAUNCHING WITHIN 30 DAYS

On the 12th of September we had a meeting of our scientists in the Department of the Army, and at that time Dr. Hovde and Mr. Morse of Boston, and Dr. Carmichael and others were there, and we talked to them about what we had been doing and our concern, and at that time I told them that in our opinion the Soviets would launch in 30 days.

Well, we took about 2 weeks worrying about this one.

On the 1st of October we prepared another proposal to go to the Department of Defense that would, if approved, allow us to get going as fast as we could.

We did not send that out and, of course, on the 4th of October they launched.

This has been a very frustrating—and that is an understatement—experience, to have been through in the last 2 years.

Now, fortunately, we are allowed to go ahead, and we are getting ready as fast as we can.

Senator JOHNSON. Then, perhaps, there may be a blessing in disguise after all.

General GAVIN. Mr. Chairman, I hear people say that. I wish I could share your feeling.

Senator JOHNSON. Well, you have become somewhat unshackled, have you not?

General GAVIN. Yes, we have; in that respect, it certainly has been.

Senator JOHNSON. If you had remained in a straitjacket, you would not have had much possibility of surviving.

General GAVIN. We would surely be much worse off.

Senator JOHNSON. Well, maybe it is not a blessing, but it would be fair to say you are much more optimistic than you were in October?

General GAVIN. Well, yes; although now we realize the Soviet achievement is of a higher order than we anticipated it would be. I think we can say that fairly.

Senator JOHNSON. Now, you realize, of course, that we consistently underestimated the Russians. We underestimated the Russians on the A-bomb and on the H-bomb. Do you think we underestimate them now on the missile?

General GAVIN. Oh, yes; I would say so.

Senator JOHNSON. Do you think we underestimated them on their other capabilities, such as the equipment that you have shown on the charts?

General GAVIN. Oh, we did that; yes, sir.

Senator JOHNSON. What is our national survival picture vis-a-vis the Russians'? Are we behind? What is your opinion?

General GAVIN. Well, sir, national survival covers a great deal of territory: political, economic, sociological, and so on.

From the straight estimate of balance of military power, our position is exceedingly difficult, I would say, at the moment.

WE ARE BEHIND RUSSIA IN MILITARY CAPABILITY

Senator JOHNSON. You think we are behind?

General GAVIN. Yes, I would say we are.

Senator JOHNSON. General, I noticed you measured your words. Do you think we are behind Russia in military capability at the moment?

General GAVIN. In the broad spectrum, and considering how it could be applied, I would say, yes, we are.

Senator JOHNSON. Have you considered your reply to that question?

General GAVIN. Yes, I believe I have.

Senator JOHNSON. What are we doing to catch up?

General GAVIN. Well, we are just pushing about as hard as our present resources will allow.

Senator JOHNSON. Do you think we are really pushing as hard as our resources will allow?

General GAVIN. I speak of the resources made available to us; we are trying to do the job.

Senator JOHNSON. But you do not think we are pushing as hard as our resources would permit if we decided to go all out.

General GAVIN. Oh, I think, in my personal opinion more of the national product could be put into defense.

Senator JOHNSON. We are pushing more today than we were yesterday, and we were pushing considerably more yesterday than we were pushing 2 months ago, are we not?

General GAVIN. Yes, I would say so.

Senator JOHNSON. What would you attribute that the effect of Sputnik I and II has had upon the thinking of this country?

General GAVIN. Oh, yes; I would say this had a very significant impact on our thinking.

Senator JOHNSON. I think your statement, General, is a very courageous one, a very comprehensive one, and I have every reason to believe, a very accurate one. I do not know that I have ever met you before. I certainly have never discussed this with you before, but I think it is going to have a very definite impact if it ever gets out to the country, and the people can read and hear what you have said to this committee.

Do you think that we are behind just temporarily? Do you think we will catch up and forge ahead and remain a leader—do you think we will regain our leadership militarily?

WILL TAKE MANY YEARS TO CATCH UP

General GAVIN. Well, of course, we must see to it that it is temporary. But this is going to take a lot of work and a lot of time. I have some concern myself about this. I noticed that Dr. Teller, I believe, gave an estimate of about 10 years.

I would say with an all-out effort, all-out effort, beginning right with the training of our youth in schools in the necessary science courses, rather the encouragement of science courses, things of that sort, we have quite a few years of very hard work ahead of us, quite a few.

Senator JOHNSON. Are you familiar with the deliberations of this committee? Have you followed them since we started with Dr. Teller?

General GAVIN. No, I have not—just in the newspapers, I would say, sir.

Senator JOHNSON. I am talking about the reports of our activities.

General GAVIN. Yes, sir; I have.

Senator JOHNSON. Would you have any suggestions to make as to how we could act more constructively to bring this to the attention of the American people?

General GAVIN. No; I think the American people are quite concerned.

In my visits around, and I visit research and development installations and have other occasions to travel about, I meet veterans wherever I go, men I knew during the war, and without exception I find people are very deeply concerned, in my opinion.

I should add, I suppose, sir, that my comment on the relative military position is, of course, a personal one, and in making such an estimate, I would equate everything I know as to capabilities and probable methods of using power available around the periphery and limited engagements, a series of limited engagements, in such a way as never to pose a clear black and white issue, and with the proper application of the resources available to them, I would say their position looks very good; it must to them at this time.

Senator JOHNSON. Don't you think that the committee and the individual Members of Congress and the leaders in the services ought to continue to do everything they can to see that the American people are fully and adequately informed so that they are prepared for the decision that we must make, and steps we must take, if we are to survive?

General GAVIN. Yes, of course I do.

Senator JOHNSON. Do you have any criticism of the conduct of this committee in that respect?

General GAVIN. Of course not; no.

Senator JOHNSON. Would you give the committee your opinion of the basic weak spots in our research, just 1, 2, 3, as you see them?

MORE BASIC RESEARCH AND FEWER COMMITTEES NEEDED

General GAVIN. Basic research, first of all, we need more.

Next, the decisionmaking processes so that, from concept to inventory, things move fast. This must be stepped up.

This, at the present time—at the present time the greatest retardation occurs, perhaps, in a committee system that is used at the present time. With the organizational changes that I suggested, I believe that the process could be stepped up significantly.

And then, third, an adequate investment of our national product in national defense overall.

These three steps, basic research, decisionmaking processes expedited, and then adequate investment of resources, all three in that order, I believe, would be worthwhile.

Senator JOHNSON. Do you know of any other opinion in high circles of the services that shares your view of the relative capabilities of the United States and the Soviet Union? Do you believe your viewpoint is generally shared by men of your—

General GAVIN. No, I do not know that I am in position to say, sir. I think each would have to speak for himself, which is what I have done in this case.

Senator JOHNSON. Well, I understood you spoke for yourself, but do you find in your associations that you are alone in your viewpoint?

General GAVIN. Well, I would put it this way, sir:

We in the Army, of course, are quite deeply concerned. We take these young men into the Army and take them overseas.

When policy requires, we commit them to combat. We are facing a very tough, very able, aggressive opponent, roughly on the order of 175 divisions, equipped with good missiles, nuclear warheads, an opponent that can call on satellites for a great deal of backup. This is an impressive foe for the Army to face.

Furthermore, at least in the pattern of combat so far, the Army has taken the largest brunt of the battle losses.

When all the promises were over and everything that was going to be done to make war highly automatic and pushbutton, when we got through with Korea, 96.5 percent of the casualties were soldiers on the ground.

OUTLOOK FOR ARMY IS GRIM

Senator JOHNSON. General, all that adds up to the reason why there ought to be some other people who feel as you do. Don't you know some in the Army that do?

What I am trying to find out is if yours is an isolated viewpoint or whether it is shared by some of your associates.

General GAVIN. Well, sir, they are concerned for these reasons. I am trying to explain why the Army feels as it does. I think we are facing a very tough prospect.

Senator JOHNSON. I can understand the reasons why they are concerned. I want to know if there is anybody else concerned besides you; I would feel a little better if there are. I want to know if there is anybody else concerned besides you.

General GAVIN. Of course, there are.

Senator JOHNSON. You think the opinions expressed to this committee are shared at least by a substantial segment in your service?

General GAVIN. Well, I would hesitate to be that specific.

Senator JOHNSON. I do not say majority.

General GAVIN. I would say a sizable portion of the Army would feel that way.

Senator JOHNSON. All right.

My staff says that I have got 1 more minute, and I am going to try to get through as quickly as I can.

I want to ask you to make a comment very briefly on the suggestions made by various groups that the committee has contacted.

On the first suggestion, which is that the United States urgently needs to bring its missile-satellite-space program under an independent civilian commission, what brief comment would you have to that? Would you favor it or oppose it?

General GAVIN. Well, briefly, it may have merit, and it certainly would do better now than in the past.

However, this is a symptom of the ill itself, the fact that we have to get one man to head it up. If the organization were properly arranged, we would not have to take measures of that sort. However, this would work, and it would work better than it has in the past.

Senator JOHNSON. However, you might not require a civilian commission provided they gave one person authority?

General GAVIN. That is right.

Senator JOHNSON. Two: There is need for a permanent, competent and adequate staff in the Defense Department to provide leadership in basic and applied research.

General GAVIN. Yes, sir; I do believe in that second recommendation.

Senator JOHNSON. You agree with that?

General GAVIN. Yes.

SHORT-TERM FUNDING VERY UNSATISFACTORY

Senator JOHNSON. The third recommendation is: The research and development program should be on a 3-to-5-year basis instead of an annual basis?

General GAVIN. Oh, sure. Nothing is worse than this year-to-year business.

Senator JOHNSON. When you keep turning it on and off.

Four: Contractors should have more leeway to make technical decisions?

General GAVIN. Yes, sir; I would say so.

Senator JOHNSON. Five: Reduce lead time by making firm and early decisions?

General GAVIN. Yes.

Senator JOHNSON. You agree with that?

General GAVIN. I agree with that.

Senator JOHNSON. You enthusiastically agree with that one.

Six: Eliminate overtime restrictions?

General GAVIN. Well, certainly now; yes.

Senator JOHNSON. General Gavin, you have been most frank and candid in your testimony before this committee. Some of the things you said appear to not be in complete accord with others who have appeared to date, with statements that have been made to the press by senior officials.

Do you anticipate any criticism as a result of your very frank response to the questions that have been propounded to you?

General GAVIN. No, sir; I do not.

Senator JOHNSON. I want to commend you on your testimony, on your frankness, on your candor, on your patriotism, and I am a great admirer of yours.

Senator SALTONSTALL?

Senator SALTONSTALL. Mr. Chairman, just a very few questions of General Gavin.

General GAVIN. Yes, sir.

Senator SALTONSTALL. You are always stimulating whether you are in a public speech or as a witness.

Do I understand you to say that you believe that there should be amendments to the Unification Act to permit a different method of planning, advising the Secretary of Defense and the authorities that are leading our defense effort?

General GAVIN. Yes; this is what I suggest.

Senator SALTONSTALL. In other words, that requires some legislation to change the operation of the Joint Chiefs of Staff as they now exist?

General GAVIN. Yes; that is right, sir.

Senator SALTONSTALL. Have you gone into detail as to that, or is that just a general idea on your part?

General GAVIN. Well, I have gone beyond just a generalization of it. I have thought it through quite well, but not to the point of writing out on a piece of paper all the details, sir.

Senator SALTONSTALL. Now, you believe that research and development of military equipment, particularly in the Army, should be stimulated? Should there be more authority for a decision? I understood you to say you thought there ought to be less committees, and somebody ought to have authority; is that correct?

General GAVIN. That is correct, sir.

Senator SALTONSTALL. And you are willing to give that authority to act to Secretary McElroy or his delegate?

General GAVIN. That is right, sir.

Senator SALTONSTALL. And you are willing to follow down the line; in other words, if they should tell the Army that they should not do certain things or that they should do something else different from what they are doing, then you believe that that is the kind of authority that we should have?

General GAVIN. Well, this authority would be inherent in the organization I propose.

I would think that the Secretaries of the separate services, too, would have their own authority in their own areas to get on with programs that they considered essential within the resources made available to them.

Senator SALTONSTALL. But if we are going to work with the money available and with the need for acceleration you have got to have an overall authority, have you not, over the three Secretaries?

General GAVIN. Yes, sir; yes.

Senator SALTONSTALL. And that authority has got to be pretty near absolute?

General GAVIN. Yes.

Senator SALTONSTALL. Finally, you believe there should be more money available for research and more money available for production of military equipment?

General GAVIN. Yes; I do.

HAS MAINTAINED CONSISTENT POSITION

Senator SALTONSTALL. And that was your same testimony to the Symington committee a year or so ago?

General GAVIN. Yes, sir; I believe that is so.

Senator SALTONSTALL. Just one other question:

You have stated to the chairman of the committee that you believed we are behind the Soviets in military capabilities today; am I correct in my statement, sir?

General GAVIN. That is correct, sir.

Senator SALTONSTALL. From listening to much testimony in the Symington committee and in this committee, I have had great confidence in the present capabilities of the SAC, the Air Force, the B-52's, and the B-47's, and believe that we should build up and maintain that Air Force until we have operational missiles, can develop missiles.

Have you not confidence in the capabilities of the SAC Air Force today?

General GAVIN. Yes; I have, indeed.

Senator SALTONSTALL. To retaliate?

General GAVIN. I have, indeed, and I think we should have the finest SAC that we can possibly obtain. I wish it had more missiles in it now than manned bombers.

HE HAS TAKEN SAC INTO CONSIDERATION

Senator SALTONSTALL. But when you say that we are behind the Soviets in military capabilities, have you taken into account the overall effect of the retaliatory power, the devastating power, of the SAC Air Force today?

General GAVIN. Yes, Senator Saltonstall.

I would go one step farther: I would say, I would also bring in probable methods of employing power which I referred to a moment ago, with the capability the Soviets have, the versatility they apparently have, and the impressive array of land vehicles, with the type forces they have, I can see the possibilities of applying power in their own way on their own initiative in such a way as to never give us a black and white issue, and I would also include probable method as well as to quantity and quality of what they have.

Senator SALTONSTALL. In other words, your estimate is based on the overall situation of the Army, the Navy, and the Air Force as compared with the Soviet Army, Navy, and Air Force?

General GAVIN. This is true, sir.

Senator SALTONSTALL. Thank you, Mr. Chairman. I have no further questions. I appreciate listening to you, General.

Senator STENNIS. General Gavin, I do want to thank you for your testimony. I have heard you on previous occasions on different parts of this subject, and I was glad to hear you say that you have not been restricted in any way, and that shows clearly that an officer that

really wants to can come on out here and say what his opinion is, and those opinions are very helpful indeed. We feel like that even if it is not correct, it is at least not canned.

General GAVIN. Yes, sir.

Senator STENNIS. I certainly think that parts of yours are certainly correct. You say you feel you are safe from any retaliation, and I certainly hope that that is correct, and I believe it is correct, too.

General GAVIN. I believe it is.

Senator STENNIS. I am impressed with what you say: that you think now the overall, the entire military strength of Russia is greater than the entire military strength of the United States; is that correct? Did you mean to put it that way?

General GAVIN. I think that the question was a little different, to which the affirmative answer was given, sir. I believe it was the relative military strength, and this would include more than just military power. It includes a number of things. I think it was a little different than that as asked.

Senator STENNIS. Yes; I think the question was different. But I wanted to know if you intended to include the meaning here that I put in my question. The overall striking power and the military power combined with Russia was greater than that of the United States. Do you mean you think that that is true?

General GAVIN. I am not—

Senator STENNIS. If that question does not state it the way you see it, why, you rephrase it, if you will, because I think you have given a very important answer there, telling us everything.

General GAVIN. Yes. I would like to refer to the question earlier, in the record. It was more in the order of our current relative capabilities are such that they are in better position than we are. It is more in that order.

Senator STENNIS. You mean their current relative capability including their probable missile strength?

General GAVIN. That is right.

Senator STENNIS. Makes them a stronger military power than is the United States?

General GAVIN. I would say so, sir.

IF WE BEND TO THE TASK WE CAN MOVE AHEAD

Senator STENNIS. With some time for us to rebuild and build further, do you think that our full capacity, once having been put on the line, do you think our capacity is great enough to overcome any superiority they may now have?

General GAVIN. Unquestionably in my mind, unquestionably. If we really put our minds to the problem and put our resources into it, we can show daylight between ourselves and the Russians.

Senator STENNIS. May I go back to a question that I have asked most other witnesses. Mr. Holaday testified today that he was director of the missile program. Still it turns out that his authority is limited by the Secretary of Defense, and I am not speaking of persons now, limited by the Director of the Budget, even though the money has been appropriated, and all those that are working on any programs everywhere in the military or elsewhere know that he has this limited authority only.

Do you think that so far as director of missiles is concerned, that he can get the job done, make plans and get the job done with such limited authority?

General GAVIN. I believe that he could, sir. Of course, he has got to get money.

Senator STENNIS. Yes, assuming there will be appropriations.

General GAVIN. Yes; I would say he could.

Senator STENNIS. Is it fair to you to ask if you think such a program is in motion now and really making headway?

General GAVIN. In motion is a good description, I would say; yes, sir.

Senator STENNIS. I beg your pardon.

General GAVIN. In motion is a good description of it, something that is moving and getting done. The basic thing I think here is, is this missiles czar to be outside of the Secretary of Defense or within the responsibility of the Secretary of Defense? If it is to be within, the way it is is fine.

Senator STENNIS. Yes. I am satisfied for it to be within if that is really going to get the job done. But we have been appropriating a world of money and had understood that these programs were moving along a great deal better than we now understand they are. At least that was my impression. Without looking for anyone to blame personally, I think the system must be bad or some individual ones. I would rather believe the system has been bad. It does not seem to me much has been done since this new start has been made or this new realization of this Sputnik No. 1 went up. We appoint more committees and all, but so far as investing someone with know-how to make a definite positive drive on this thing, to plan and then carry out the plan, I don't see where much has been done.

We have to assume that everything is going to be changed and different and better without any different plan or without any additional authority to move.

That is why I don't believe it is yet off dead center, to be frank about it. You say you think it is?

General GAVIN. Things are in motion, as you said, sir.

Senator STENNIS. Your testimony has been very helpful. I think the Nation will be helped. That is all I have, Mr. Chairman, thank you.

Senator Bush, I believe, is next.

Senator Bush, do you have any questions?

PREFERS TO CALL IT A "SENIOR UNIFIED STAFF"

Senator BUSH. General, I would like to go back to your statement about the Joint Chiefs of Staff and also to Senator Saltonstall's question on that point.

I gather from what you said, if I recollect it, that you have in mind a modification of the law which would do away with the Joint Chiefs of Staff but replace it by a general staff or something of that order.

In other words, my question is, is your suggestion in line with the proposition that we should have not just a planning staff but a general staff which is operational and a command organization of itself a unified command rather than just a planning organization like the general staff.

Is that what your—

General GAVIN. Yes, I would say that is it except for the words "General staff."

I would say a senior unified staff.

Now the thing that disturbs a number of people, and I am included, that have worked in the Department of Defense for some time, is that there is no operational staff within the Department of Defense staff, and in the event of war it would have to be reorganized to function I would presume.

Senator BUSH. What is the difference between what you are telling us and what we hear of as a general staff as exemplified let's say by the German organization during World War II?

General GAVIN. Yes. May I say before I answer that the Joint Chiefs of Staff might be kept—three senior military advisers could be kept as a group to advise the Secretary of Defense, I would say perhaps after they have left their service, so a group like that might be useful as elder statesmen, let us say, in military affairs.

Senator BUSH. Yes.

General GAVIN. To get back to the last question, I am not sure, sir, what the words "general staff" mean to you.

Our staff organization is not like the German staff organization. It is quite different. But functionally we break it down along rather well-understood lines of personnel, logistics, intelligence and operations, and then is added research and development and so on.

It would be a staff like that, a staff much the same as Mr. Brucker has available to him today and Secretary Douglas has available to him also, something of that sort.

Senator BUSH. To me I mean a general staff, I probably do not understand the term in the military sense as you do, but what I had in mind is a unified command.

In other words, this has come up before, and we do have it in places.

General Norstad has a unified command.

General GAVIN. That is correct.

Senator BUSH. And so forth.

What I am getting at here is, would not the Secretary of Defense and all of us be better off if instead of having the Joint Chiefs as simply a planning organization, which I understand it is—

General GAVIN. Yes.

IT WOULD BE A UNIFIED COMMAND—SAYS GENERAL GAVIN

Senator BUSH. If we had in their counterpart or in the substitute setup for them a real unified command, which would really have command over the Army, Navy, and the Air Force?

General GAVIN. Well, in effect this is what it would be, with of course the Commander in Chief being the President, and the Secretary of Defense then really exercising the functions of the office in a command way; yes.

Senator BUSH. Would you care to offer any further observations on the question of the unified command than you have already said, or do you want to stand on just what you have already said in that connection?

General GAVIN. Well, sir, except to perhaps add once again that our experience in running large geographic areas and carrying out

great responsibilities in large theaters has made quite clear to us that you can unify staffs.

You can get the fine military competence of all services into these staffs and get good professional judgment brought to bear on the problems of the man in charge, and this is all that we suggest doing in this case.

Senator BUSH. So, in a general way you are thinking that more unification would be a better thing, would be a good thing for us?

General GAVIN. If this is the way you would describe it, I would say so; yes, sir.

Senator BUSH. In your estimate of the relative strength of ourselves and the Russians, do you take into account the factor that they would be the ones that would likely start a war if one were started, and the fact that we are inhibited by everything I guess, custom—

General GAVIN. Yes.

Senator BUSH. Morality, whatever.

General GAVIN. Yes.

Senator BUSH. From doing it?

In other words, we just assume, the people of our country just assume that we would not start the war.

We assume if there is going to be one, that they would start it, and with the effectiveness of modern weapons that would likely be used at the, used against us at the very outset, the handicap which we would endure would be it seems to me enormous, because of the fellow that starts it this time would seem to have a very great advantage.

General GAVIN. Yes, sir.

RUSSIA HAS THE CHOICE

Senator BUSH. Far greater than perhaps he ever had before.

Now I wondered whether you had taken that into account in making your estimate of our relative position?

General GAVIN. Oh, yes, I did, sir, and I would like to make clear again that method was considered, and they do have the initiative and can elect a course of action.

I have brought up a number of times here the words "limited war." They can engage with the type force they now have, in an effective way, around the periphery of their area of interest and this is for them to do or not.

Senator BUSH. I thought that that was what you intended to do, and my question was only to clarify that point.

General GAVIN. Yes.

Senator BUSH. It seems to me it is a very important one in connection with our position vis-a-vis them today. I don't have any other questions, but I do want to join with my colleagues here in thanking the General for a very clear and concise statement, his willingness to answer almost every conceivable question.

It has been a most admirable presentation.

Senator JOHNSON. Thank you, Senator Bush.

The Chair is delighted to note the attendance of our colleague, Senator Mundt.

Senator Symington, we want you to take the witness now.

Senator Mundt, at the conclusion of Senator Symington's questions, if you have any questions we would be delighted to have you participate because we know you can make a contribution to our hearing.

Senator Symington.

Senator SYMINGTON. Thank you, Mr. Chairman.

Senator JOHNSON. Take as much time as you want.

We are not advocating that we stay here all night, but we do want you to spend a substantial time because this will be the last witness.

We don't expect to hear any more after we finish with the general. Tomorrow we will have General Medaris and Dr. von Braun and Dr. Martin and Secretary of the Navy Gates, the Chief of Naval Operations, Admiral Burke, Rear Admiral Clarke, Rear Admiral Hayward, Rear Admiral Rayborn, Rear Admiral Wheatley, and Assistant Secretary for Air Garrison Norton, but this will be the last witness this evening.

The witness is yours, Senator Symington.

Senator SYMINGTON. Thank you, Mr. Chairman.

I will try to be brief.

General Gavin, I congratulate you on your testimony tonight.

It has been a privilege to know you and I am sorry that for many months we have not had a chance to discuss these matters.

We are finally getting out the facts to the people under the leadership of our counsel and our chairman and this committee, the only way democracy can live.

You were born in 1907; is that right?

General GAVIN. That is correct, sir.

Senator SYMINGTON. And you enlisted in the Regular Army in 1924, advancing to the rank of corporal, is that correct?

General GAVIN. That is correct, sir.

PASSED EXAMINATION FOR ENLISTED MEN TO GO TO WEST POINT

Senator SYMINGTON. And then you went to West Point through examinations given some enlisted men?

General GAVIN. That is correct, sir.

Senator SYMINGTON. You have risen, in other words, from an enlisted private to a lieutenant general, is that correct?

General GAVIN. That is correct.

Senator SYMINGTON. Your decorations are such I would not want to read them. It would take too long. But it is a fact, is it not, that in addition to being decorated by a great many other countries, you have every medal for valor this country can give except one, is that correct?

General GAVIN. That the Army can give, sir.

Senator SYMINGTON. Right?

General GAVIN. Yes, sir.

Senator SYMINGTON. Incidentally I see you were decorated by the Russians.

How come?

General GAVIN. Yes, indeed. I expected to be asked that someday.

Senator SYMINGTON. Well, we might as well ask it now.

General GAVIN. I forget how that worked out.

As I recall, we were in those happy honeymoon days in May of 1945 and we traded decorations back and forth in the interests of good will and so on, and I became the recipient, quite surprisingly of one.

Some of my colleagues had a lifetime pass to ride the Moscow subways.

I was not so fortunate.

Senator SYMINGTON. You have the Purple Heart for being wounded in action, is that correct?

General GAVIN. That is correct, sir.

Senator SYMINGTON. Listening to your testimony you talk like General Collins, General Ridgway or General Van Fleet.

It is mighty refreshing.

You know about the Cordiner report?

General GAVIN. I do, sir.

Senator SYMINGTON. Do you approve of it?

General GAVIN. I do.

Senator SYMINGTON. Do you think that the adoption of many if not most of its suggestions would improve the morale and efficiency of the Armed Forces?

General GAVIN. Yes, I certainly do.

SMALL WAR COULD ERUPT INTO LARGE WAR

Senator SYMINGTON. In the air power hearings on June 18 1956, General Taylor testified:

If the small war breaks out, we must suppress the war promptly because that small war may easily lead to the great war which we are all trying to avoid.

Do you agree with that?

General GAVIN. I certainly agree.

Senator SYMINGTON. We have had a lot of talk about missiles, and I am anxious we chase the Russians in the missile field. But it is true, is it not, that, if we were forced into a fight today, tomorrow, or next year, we have to fight with forces in being, existing forces; is that correct?

General GAVIN. Yes; that is correct. And, of course, this bears on my answer to the question a moment ago about relative capabilities, this matter of timing and method and what can really be done.

Senator SYMINGTON. In your opinion, so far as the Army is concerned, is it ready and capable to suppress successfully, based on our international commitments, any of the small wars General Taylor referred to?

General GAVIN. "Any" covers a great deal of territory. It could deal with some.

Senator SYMINGTON. How many divisions have we now?

General GAVIN. I believe we have about 15 now.

Senator SYMINGTON. How many of those are combat ready?

General GAVIN. I would hesitate to give you the exact figure on that. I really work mostly in research and development. I could give you an estimate.

Senator SYMINGTON. Take a guess.

General GAVIN. I will take a guess of about, combat ready, perhaps about 10 or 11, and the remainder would be in training, you see, for the other divisions.

Senator SYMINGTON. How many of those are mechanized?

General GAVIN. I would estimate, of those, about three.

Senator SYMINGTON. Not counting the Chinese divisions, how many divisions do we estimate the Russians now have?

General GAVIN. 175.

Senator SYMINGTON. And how many of those are mechanized?

General GAVIN. I am not sure, but I would say it is very high now. They have been mechanizing their divisions at a very rapid rate. Nearly everything they have is on tracks and wheels right now. So, it would be of a high order, approaching 80.

Senator SYMINGTON. We hear a lot about atomic weapons. How many divisions have we adequately equipped with atomic and other modern weapons?

General GAVIN. Well, sir, we have nuclear weapons wherever we have divisions, and the missiles to deliver them, in limited numbers, and the ranges of the missiles are such that they support the divisions. That is, you do not have within the division so many nuclear weapons, although this is possible with Honest John-type weapons. But the range is such that you can get support from Corporals and the longer range missiles.

OPTIMUM PEACETIME ARMY, 28 DIVISIONS

Senator SYMINGTON. How many divisions do you think we should have, based on our international commitments?

General GAVIN. Well, sir, this is very difficult to say. I think that General Ridgway testified before Congress about 3 years ago that he thought an optimum peacetime Army under the conditions then prevailing was about 28 divisions, and I think that is a rather good figure. However, now you would need a great deal more in the way of missile-support commands, and the like of that.

Senator SYMINGTON. How many of those divisions do you think should be mechanized?

General GAVIN. I would say about—a very high number, on the order of about 14.

Senator SYMINGTON. General Taylor testified in 1956 that the Army budget requirements for the fiscal year 1958—

will be greater, primarily because of the modernization factor;

His testimony was that you would require "around \$12 billion, something of that magnitude," for fiscal year 1958.

Do you recall what you actually did receive?

General GAVIN. I am not sure, sir, but it was—I am not sure. I would like to provide it for the record.

Senator SYMINGTON. I think it was \$7.264 billion. In other words, about \$5 billion less than he said was essential in his previous testimony. Unless General Taylor's estimate was padded—you do not think it was, do you?

General GAVIN. Of course not.

Senator SYMINGTON. Or world conditions have materially improved—and you do not think they have, do you?

General GAVIN. No; they have not.

Senator SYMINGTON. A cut of \$5 billion must have required substantial curtailment in the Army's modernization and structure, which General Taylor thought was necessary; is that not a fair deduction?

General GAVIN. Yes, sir; that is so.

REDUCTIONS IN ARMY NOT REPLACED SINCE SPUTNIK I

Senator SYMINGTON. Since the budget was originally presented to the Congress in 1958, there were heavy reductions made in the Army in such things as research and development, in maintenance and operation, in personnel, and, as we know, in procurement. To the best of your knowledge, since October 4, 1957, have any of those reductions been replaced?

General GAVIN. This is in 1958 money, now?

Senator SYMINGTON. Yes.

General GAVIN. No; they have not.

Senator SYMINGTON. And so, if there has been anything done by us in the way of acceleration, the Army has been left out, with the exception of its missile program; is that correct?

General GAVIN. Well, there has been no augmentation of 1958 funds since October 4.

Senator SYMINGTON. No increase?

General GAVIN. That is right, no increase; that is right, sir.

Senator SYMINGTON. Thank you. Now, due largely to cuts by the administration from the original budget submission, the amount actually appropriated for the fiscal year 1958 for the Army was about \$300 million less in new money than for fiscal year 1957. What do you think about that?

General GAVIN. Well, sir, my primary, let us say, preoccupation these days is with research and development, and my budget was cut.

Senator SYMINGTON. It was cut.

General GAVIN. Yes, sir; it was. In fact, you may recall I defended a budget of \$372 million before Congress, and some of that was withheld, and I have been operating on the prospect of \$355 million, and then Jupiter was funded out of the money that was withheld.

Senator SYMINGTON. In other words, except for some work that was done on Jupiter, which, of course, has moved more into the news as a result of sputnik, our reaction to the Russians' stating they had the ICBM and launching the satellites, so far as the Army is concerned, is to heavily cut research and development in the fiscal year 1958 funds and to maintain those reductions. Is that correct?

General GAVIN. Well, so far, there has been no increase.

Senator SYMINGTON. Then my statement is right, is it not?

General GAVIN. That is correct.

Senator SYMINGTON. In 1952, General Eisenhower referred to, and I quote:

Our defense program has suffered from lack of farsighted direction. Real unification of our Armed Forces is yet to be achieved.

He also said:

Service disagreements have become public brawls.

Would you care to give the committee your current views on the state of unification in the services? Has it improved or has it not improved?

MORE SERVICE COOPERATION THAN THERE IS DISAGREEMENT

General GAVIN. Well, I am not sure what people mean by "unification" in reference to interservice controversy. It has not been

harmful. It apparently does become so in committees, at times, in the Department of Defense, and thus impacts on our programs.

But actually, there is more interservice cooperation than there is disagreement. We are getting on quite well. I know this from personal experience.

Senator SYMINGTON. I am glad to hear that.

Now, you yourself, on May 22, 1956, said:

The Department of Army programs in missiles and aircraft are intended to give it a capability of fighting successfully in any war or police action short of war in which our Nation may find itself.

Could you give this committee your best judgment as to how far short of this expressed intention the Army's capability is at the present time?

General GAVIN. I would hesitate to put a finite figure on it in terms of divisions, which I presume is what you desire. Modernization is terribly important as well, so both quantitatively and qualitatively I believe we should be better off than we are.

I think the figure I gave you earlier of an optimum Army of about 28 divisions is one that I would stand by, and it should be modernized and backed by adequate missile support.

Senator SYMINGTON. Is this lack of modernization or lack of quantitative or qualitative superiority the result of insufficient funds or lack of interest on the part of the Army?

General GAVIN. Well, just put that way, black and white, of course, there is no lack of interest on the part of the Army, so it must be funds, but there are other things, than just funds involved. There is decision making and how funds are used.

MORE MODERN ARMY AWAITS BETTER FUNDING

Senator SYMINGTON. The net of it so far as you are concerned, and I just want the record to be clear, is that our Army would be more modern and it would be larger if there were, in your opinion, adequate funds.

General GAVIN. Yes, I would say so.

Senator SYMINGTON. The Russians seem to have enough funds, do they not?

General GAVIN. Apparently so.

Senator SYMINGTON. In a recent book, Mr. Baruch said he would never agree this country couldn't spend as much to defend its freedoms as any other country could spend to destroy those freedoms. Will you agree with that?

General GAVIN. Yes; of course I would agree with that.

Senator SYMINGTON. You would?

General GAVIN. Sure.

Senator SYMINGTON. Why do you think it is the Russians are spending so much more of their gross national product, with the announced intention of destroying this country, than we are?

General GAVIN. Maybe Mr. Khrushchev meant it when he said, "We will bury you."

Senator SYMINGTON. Do you think we are going to catch up with the Russians?

General GAVIN. I am worried. We have got to do a lot more hard work than we have done so far in the last 10 years.

Senator SYMINGTON. You agree with Dr. Teller on that?

General GAVIN. I do agree with Dr. Teller.

Senator SYMINGTON. You believe that if we don't have a sharp change in our approach to this entire problem, psychological as well as physical, and a recognition of the danger instead of all this soft talk, complacency, we will be in a position where we might find ourselves, definitely inferior in strength. Is that correct?

General GAVIN. Yes; I would say that is so, and that motivated me in saying what I said here this evening.

Senator SYMINGTON. General, those of us who would like to get the facts before the people at times are accused of being hysterical or panicky. Do you think the work of this committee has any hysteria or panic in it just because we are trying to develop the facts so the American people will understand their position?

General GAVIN. No, I don't at all, no.

Senator SYMINGTON. Around last May 22, you said:

We are confident we will achieve the first 1,500-mile ballistic missile capability in the Western World.

I presume that had to do just with the Western World, did it not?

General GAVIN. Yes.

Senator SYMINGTON. How do you feel about that now? Are you still confident we will be the first in the Western World?

General GAVIN. In the Western World, yes, oh, yes.

THE "PRICE" OF PUTTING THE ARMY IN INDOCHINA

Senator SYMINGTON. Getting back to some of the previous problems, it is true, is it not, back in 1953, that General Ridgway did not want to put the Army in Indochina because of lack of strength?

General GAVIN. It wasn't quite like that.

Senator SYMINGTON. Would you state how it was?

General GAVIN. Actually, I was his chief planner at the time, and we made estimates and calculations as any prudent staff would in case of any contingency of this sort.

I am saying this to make clear that there was no intent to put a plan into operation, and it was quite apparent at that time that to embark on a commitment of force of the magnitude required there would require more than the use of the forces in being.

You would have to call up certain reserve forces, the National Guard, to be exact, open facilities, open production facilities, and so let us say there was a price tag put on the undertaking, and General Ridgway was quite ready and the Army was quite ready to do the job if the proper authorities were ready to pay the price, and it meant doing more than you could do with the forces in being.

Senator SYMINGTON. It meant more than you could do with the forces in being?

General GAVIN. That is right.

Senator SYMINGTON. How long would it have taken, at the time of the crisis of Indochina in 1953, how long would it have taken to get the forces in being?

General GAVIN. Yes, it would require calling up quite a number of National Guard divisions, sir, and bringing in reserves and opening facilities and so on, and it would have taken some time.

This was an ordinary measure of prudent backup. You could commit the forces you had, but of course without backing them up, you were inviting disaster.

Senator SYMINGTON. You are now in research and development, but nobody in the Army has had more battle experience than you, and few people more planning experience. I was in Europe last spring and talked to our people over there. The French commitment on NATO is 5 divisions, but they have considerably less than 1, is that correct?

General GAVIN. I would hesitate to confirm that.

Senator SYMINGTON. The British in their white paper in April reduced their European commitments, their NATO commitments, I believe, from 77,000 to an ultimate 41,000.

General GAVIN. It was on that order of magnitude, that is right.

Senator SYMINGTON. We of course have maintained over there what we said we would?

General GAVIN. This is true. We did.

Senator SYMINGTON. If you were worried about our situation with respect to Indochina, based on the tens of thousands of Americans over there today, with families, if you would take off your research and development hat for a moment and put on your planning hat with respect to what might happen if the Communists moved, you must have some rather sleepless nights, don't you?

General GAVIN. That is true.

Senator SYMINGTON. That is one of the reasons you said that you thought that overall that our military position is now secondary to the Russian position?

General GAVIN. Considering capabilities and methods available to both sides.

SOME OF THEIR EQUIPMENT BETTER—SOME OF OURS BETTER

Senator SYMINGTON. Thank you, General. Now you gave some photographs here, and showed that the Russian equipment is good; you already told us that they have about 10 times as many divisions as we have. Would you say that their equipment in their Army is qualitatively inferior, equal or superior to ours?

General GAVIN. It is both ways, sir. Some that we have seen is superior to ours, and we believe that others are inferior.

Senator SYMINGTON. Switching for a minute, Colonel Sigley testified in 1956 that he believed it would take between 150 and 200 million dollars of research and development funds to develop an antimissile missile. How much of that estimated amount do you know, roughly, that you have received?

General GAVIN. So far? I will get the figures on that in just a moment for you.

Senator SYMINGTON. Will you make them a matter of record?

General GAVIN. Yes, sir.

Senator SYMINGTON. Have you changed that estimate?

General GAVIN. That is a rather good estimate, I would say.

Senator SYMINGTON. Your testimony has been refreshing and informative. Why would the Russians ever want to fight an all-out war the way things are going? Wouldn't there be much more chance of their fighting a peripheral war?

General GAVIN. This colors very much my answer to relative capabilities because I believe this is the case. They would do much better to keep things in a grey area and move around the periphery in limited engagements, achieving limited objectives, yes.

Senator SYMINGTON. And yet we not only have not accelerated our conventional forces since sputnik. We have not yet replaced the cuts made in those forces during the year 1957, in the fiscal 1958 budget. Isn't that correct?

General GAVIN. I would say that is correct, yes, sir.

Senator SYMINGTON. That is an astounding piece of testimony.

General, you testified, and I quote:

If the Russians acquired one IRBM operationally reliable and accurate significantly ahead of us, it could make a great difference in our power position.

That was in 1956. As you know, the present Deputy Secretary of Defense said that the IRBM in Russian hands would not make "material difference in the balance of power."

Do you still stick to your position?

General GAVIN. Yes; I do.

Senator SYMINGTON. Do you still hold to your views as to the relative importance of IRBM's as attacking weapons against our foreign bases, as compared with manned bombers?

General GAVIN. I am not quite sure.

Senator SYMINGTON. I think in your testimony in 1956 you stated that an IRBM could be a more effective weapon?

General GAVIN. Yes.

Senator SYMINGTON. Against bomber bases?

General GAVIN. Yes, no doubt; oh, yes.

WEATHER IMPORTANT FACTOR

Senator SYMINGTON. I might say I completely agree with you on that, because whereas we were never turned back in World War II by enemy action, we were turned back a great deal by weather.

General GAVIN. That's right.

Senator SYMINGTON. And weather would not bother an IRBM.

General GAVIN. That is true.

Senator SYMINGTON. Do you think the Soviet is significantly ahead of us in operational capability of IRBM's today?

General GAVIN. Let us say the IRBM covers a spectrum—what shall we say, sir, eight to twelve hundred miles or somewhere in there?

Senator SYMINGTON. Or let us say anything from five to fifteen hundred.

General GAVIN. Yes. The answer is yes.

Senator SYMINGTON. You think so?

General GAVIN. Yes, I do.

Senator SYMINGTON. It wasn't necessary that they be ahead, was it? I mean we would have avoided being behind if we had tried harder, could we not?

General GAVIN. In my personal opinion we could have.

Senator SYMINGTON. How? What could we have done to avoid losing this race to the Communists?

General GAVIN. Yes, there has been—well, let's put it this way. We could have started our programs earlier and supported them

more fully in the late forties and even as late as the early fifties. To my personal knowledge we could have supported our missile programs much more fully than we did.

In fact, we were anxious to start an IRBM program in the Army in early 1955, and in fact, I had occasion to go to General Ridgway and talk to him about it in April of 1955.

Colonel Nickerson had come to talk to me about it several times that spring, and I talked to General Ridgway about it. There was quite a price tag on it.

As I recall, it was in the order of about \$25 million, and he took it under consideration, and several days later I talked to him about it and he decided that the money just wasn't available, so that we had better try austere to move the Redstone out to 500 miles or something of that sort, something in that order.

Senator SYMINGTON. In other words, the reason that the Russians are ahead of the United States in the IRBM field in your opinion is because of lack of funds?

General GAVIN. And early prosecution of a program. Time was involved here too, because funding is available now.

Senator SYMINGTON. If you had had the funds, you would have prosecuted the program, wouldn't you?

General GAVIN. That's right, but funds are available now.

MODERNIZATION OF ARMY TOO SLOW

Senator SYMINGTON. You testified in 1956 that American boys will suffer "more casualties" if we don't have the most modern equipment for peripheral wars. You also said "I don't feel we are modernizing the Army as rapidly as needed."

General GAVIN. That is true.

Senator SYMINGTON. Since that time the amount of money that has been available to you has been heavily cut for fiscal reasons instead of increased, is that not correct?

General GAVIN. Well, heavily, I would take advisedly. It has been cut, let us say—

Senator SYMINGTON. I think \$300 million was the figure?

General GAVIN. Yes, sir. The problem we have in research and development is that we have gone along on a steady level of effort, we have absorbed operation and management costs and other costs that in effect have reduced steadily the amounts going into research and development. The cut may have been a heavy one. In any case, it has been rather serious.

Senator SYMINGTON. In what major respects do you believe the Army is deficient today?

General GAVIN. In what major respects?

Senator SYMINGTON. Right, vis-a-vis the Russians?

General GAVIN. Well, I would say we should have a better family of tracked vehicles and this includes tanks, in the necessary categories, and personnel carriers. We should have a better family of surface missiles now. We should have an antimissile missile quicker than we are going to get it.

I would say in these principal areas, that is, the very essential mobility and modern fire power.

Now in addition, of course we should have more tactical and strategic air mobility than we have so that we could move the forces we have quicker. Within the Army itself, in my personal opinion, we should have a better family of our own organic air vehicles. These are the most important categories.

Senator SYMINGTON. If the Russians attacked Europe, based on your experience, do you think there is any effective ability to stop them over there unless we use nuclear weapons?

ADVOCATES NUCLEAR WEAPONS FOR LAND WAR IN EUROPE

General GAVIN. Well, sir, I have gone on record on this point a number of times. I think nuclear weapons are now conventional weapons, and they can be developed and are being developed for use against tactical targets both for protection against air attack as well as protection against land forces. I would say therefore absolutely, nuclear weapons must be used in land warfare in Europe.

Senator SYMINGTON. Now we set up a deal you might say, an arrangement, abroad, whereby we were to put in so much and other people would put in so much. That was based of course on relative strength. We have little over there comparable to what was agreed on, say at Lisbon.

What would happen if the Russians suddenly decided they would move in Europe, and warned us as they warned the French and the British in the Suez crisis in the fall of 1956, that they would give us an all-out hydrogen war if we resisted. Would we have a chance in Europe?

General GAVIN. This is quite a speculative question.

Senator SYMINGTON. That is right. It is a hypothetical question.

General GAVIN. I do believe it would be quite inappropriate for me to give an opinion on this because you set up a series of assumptions that may or may not come to pass.

Senator SYMINGTON. I would like to rephrase the question because I think the people would like to know how you feel. Is there any chance now, based on the way we are manipulating our defenses, for this country to defend itself and its many allies without going to all-out war, to defend successfully itself and its allies in conventional war, in your opinion?

General GAVIN. There certainly better be, because the issue may not be all-out war.

Senator SYMINGTON. I agree with that, but my question still stands. Is there any way, based on the figures you have given of Russian strength vis-a-vis our strength, that this country can defend itself or its allies, unless it goes to all-out war?

General GAVIN. I would say, yes, there is. You are touching upon a very interesting point there, but I would say, yes, there is; yes.

Senator SYMINGTON. And would you describe the reasons for your belief?

WE WOULD LEAN HEAVILY ON OUR ALLIES

General GAVIN. Our policy, of course, is one of coalition, and we do depend on our allies. We have some 200—the equivalent at least of 200 divisions are the recipients of our military aid, and we must rely upon them for a great deal of support, and we do; and we check

carefully their level of training and their use of resources given to them.

We also have a tremendous amount of resources of our own in our reserves, and I think we must count upon calling up all of our power as rapidly as we can to meet the situations as they develop, counting upon the forces we have overseas to give us the initial cover, and working with our allies until we can apply all the power we have. I can see where this can be worked out.

Senator SYMINGTON. If you would like me to rephrase the question so that it would be clearer later on, I would be glad to change the record also, accordingly.

General GAVIN. No, sir; I understand it. It is quite all right now.

Senator SYMINGTON. Thank you, General.

In 1956 you testified that the Army was receiving insufficient funds for research and development. Yet after your testimony to that end the budget which was sent to the Congress for research and development for the Army was \$10 million less for the fiscal year 1958 than for the fiscal year 1957. Apparently they didn't agree with your testimony.

General GAVIN. That's right, sir.

Senator SYMINGTON. Has that affected the modernization of the Army?

General GAVIN. Yes; it has.

Senator SYMINGTON. In what fields? I suppose based on your previous testimony, in all fields except the Jupiter?

General GAVIN. That's right. Just about in all fields except the Jupiter, we have slipped steadily in all missile programs, for example.

Senator SYMINGTON. And even after October 4, which Dr. Teller called our technological Pearl Harbor, there not only hasn't been any acceleration of the Army program; there has been no replacement of those cuts, even in research and development, is that correct?

General GAVIN. That is correct. However, the consideration being given to the next year's budget I presume will reflect some concern.

Senator SYMINGTON. You mean you believe that—

General GAVIN. There will be more money.

Senator SYMINGTON. You will be able to get more money for research?

General GAVIN. Yes; I believe so.

Senator SYMINGTON. That is what you thought a year ago about the 1958 budget, wasn't it?

General GAVIN. That's right. I didn't get it. That's right.

Senator SYMINGTON. Actually, was it asked for beyond the Department of Defense? Did the Department of Defense ask for more money?

General GAVIN. In my particular budget; no, sir. Mine got to the Department of Defense and no farther.

DOING WELL WITH WHAT THEY HAVE GOT

Senator SYMINGTON. What did you get in research and development last year?

General GAVIN. Last year?

Senator SYMINGTON. Yes.

General GAVIN. I defended \$372 million and we had quite a tussle over \$8 million, but then it turned out I got \$355 million.

Senator SYMINGTON. There is another subject we have discussed, and that is the question of airlift. You, perhaps more than any other officer, are dedicated to the theory of mobility in ground forces. That is correct, is it not?

General GAVIN. That is correct, sir.

Senator SYMINGTON. And the testimony that you gave last year was that the Army would have great difficulty in handling a single division overseas. Of course, we were talking about lifting and properly supporting a division overseas. Has there been any change in that position?

General GAVIN. Well, there certainly has been some, but not a significant change. No large aircraft have come into the inventory in any number.

Senator SYMINGTON. Actually, you can't lift and properly lift a single division overseas, can you?

General GAVIN. I would say it would be marginal, and perhaps this should be looked into more carefully.

Senator SYMINGTON. With all the problems around in the Middle East and the Far East, and Germany, doesn't that mean that in effect our Army is not mobile.

General GAVIN. Yes; it is far from being as mobile as it should be; far from it.

Senator SYMINGTON. Yet there has been nothing whatever done about that, has there?

General GAVIN. I was sorry to see the contract for the C-132 canceled.

Senator SYMINGTON. And there were no orders in the fiscal year 1958 budget for the 133?

General GAVIN. I am not sure about that, sir. I was checking on that recently, and I think there are six in the inventory now. I am not sure of the figures.

Senator SYMINGTON. And the C-130 is really nothing more or less than a further development of the 119, is it not? It is a tactical plane?

General GAVIN. It is a tactical plane; that is correct, sir.

Senator SYMINGTON. So what you are saying is that despite the 83 commitments, or 120 we have all over the world, plus all the talk about the problems in Turkey and the Suez, and Syria and Germany and Japan and Indonesia and Indochina, Formosa, and Korea, and despite the fact if we had a conventional war we would naturally want to move our troops as fast as possible, not only can we not lift and properly support a single division overseas, but we have eliminated completely any further research and development in the strategic-airlift field. Is that not a statement of fact?

General GAVIN. Well, the elimination of further research and development—I am not sure about that, sir. The Air Force may be doing something of which I am unaware.

Senator SYMINGTON. But if they are doing anything, you are unaware of it?

AIRLIFT REQUIREMENT EXISTS FOR MISSILES TOO

General GAVIN. I am unaware of it. I would like to add to that too, another aspect of it that now concerns me very much, and that is that

all missiles in my opinion should be air mobile, and all fissionable material likewise.

It suggests an economical use of resources so you do not have huge stockpiles of fissionable material, and from the viewpoint of missiles they are very sensitive to obsolescence. They need rapid handling, and I would say they should all move by air. So the airlift requirement exists, as I expressed it to the committee, of which you were chairman, some time ago, and in fact, it has become more acute.

Senator SYMINGTON. Back about 11 years ago Secretary of War Patterson issued a directive that all equipment should be studied from the standpoint of its capability of being airlifted. Is there anything like that going on in the development of material, of equipment in the Army?

General GAVIN. Yes, there is, I would say. We are making a real effort, and it is evident in some of the equipment now coming up, such as the mechanical mule the M-56 and the creation of the 101st Airborne Division as an experimental division in this area. We are working very hard on that, sir.

Senator SYMINGTON. Getting back once more to the question of research and development and/or procurement, the C-132, the most advanced strategic airlift plane has been dropped, has it not?

General GAVIN. That is correct.

Senator SYMINGTON. And no C-133's were in the fiscal year 1958 budget. Is that correct?

General GAVIN. I am not sure about that.

Senator SYMINGTON. I believe I am sure of that.

General GAVIN. Yes.

Senator SYMINGTON. How about the fiscal year 1959? Do you know if any are in there?

General GAVIN. I do not know; nor would I be in a position to know at this time.

Senator SYMINGTON. A final question or two. Have you submitted your fiscal year 1959 research-and-development figures yet?

General GAVIN. Yes, sir; I have.

Senator SYMINGTON. Have you had any guidelines or feelings placed on what you were supposed to submit from the standpoint of getting the modern army you think we need?

General GAVIN. Well, the guidance which I received was quite clear, and it limits the amount, let us say, that I may request. However, there is still considerable discussion about the budget, and I may have an opportunity to ask for additional funds.

Senator SYMINGTON. Are you saying that, in spite of sputnik, in spite of the sharp recognition now, realization on our part of Russian progress, that your research-and-development funds are again going to be limited by fiscal considerations?

General GAVIN. I would not say that this is entirely so, sir.

HE EXPECTS INCREASED FUNDS FOR R. AND D.

Senator SYMINGTON. Please give the record, because we want the facts.

General GAVIN. No. I have been called into conference by Dr. Killian and the Department of Defense and there are indications that I am going to get more money in 1959 than I have been given in the past.

Senator SYMINGTON. Mr. Chairman, I have no further questions, and congratulate General Gavin on as fine an appearance as I have heard since I have been in the Senate.

Senator STENNIS. That is very fine. I would like to join the Senator in his congratulatory remarks, too.

Senator MUNDT, may we say again, sir, that we are very glad to have you here. You are a familiar character in this hall as well as others on the Hill. You are a very valuable member of our committees. Do you have some questions you would like to ask?

Senator MUNDT. I might ask one. I don't know whether the general can answer it or not.

Sitting as a member of the Appropriations Committee, eventually we will have to wrestle with these problems which are being discussed. Recognizing that in the last Congress our committee did make available more money than the House was willing to support, and we may have to do it again, if you are in a position to translate into dollars your recommendations, could you give some indication of what this means in terms of an appropriation, if you could write the ticket yourself? I would be glad to hear it.

General GAVIN. For research and development alone?

Senator MUNDT. Yes, that would be in comparison I think with the 372 request of a year ago.

General GAVIN. Yes. Well, as a matter of fact, my request which I have testified before the Appropriations Committee of the Senate last year, was \$596 million, and the current state of affairs is such that it would be significantly greater than that. So it is somewhat double what I got last year.

Senator MUNDT. Your request would be somewhat double, or double the 372?

General GAVIN. Double the \$372 million, roughly. That is in order of magnitude too.

Senator MUNDT. Roughly in the neighborhood of \$700 million?

General Gavin. That's right, sir.

NO SUGGESTIONS FOR SAVINGS

Senator MUNDT. I ask you this, General. We hear considerable discussions from our constituents who are greatly concerned about the international situation and the defense problems, and who also have an understandable concern about the fiscal state of the country, as to whether or not as the Army spends additional money and the Defense Department spends additional money for these new type weapons, which, of course, is essential, are there any economies which you might suggest that we might save in the Defense Department, from less emphasis, perhaps, on old type weapons and old type organizational procedures?

Are there economies that we might effectuate as we move into the new type areas and abandon, put less emphasis and less expenditures on the older type defense establishment?

General GAVIN. Well, sir, obviously, it would be nice to say, yes, I can cite specific things, but I must say I am not in a position to. We have been suffering from a degree of malnutrition for some time.

I don't know of any specific eliminations that I could put on the line now. I really don't.

Senator MUNDT. In your work, planning, I suppose you do re-evaluate all of these older type weapons, try to determine whether we have to pull those along with the newer type or whether they can be abandoned, and perhaps new emphasis be spent on the newer type weapons?

General GAVIN. We are going after the newer weapons just as fast as we can, and we will really eliminate where we can. There is not a great deal to eliminate, as I see it.

We are cutting out of our projected inventory, for example, significant quantities of artillery, Army artillery, Corps artillery, and the like of that.

Unfortunately, missiles cost more than they do.

Senator MUNDT. I am sure that is right.

I was wondering this. Frequently I am asked this question: Whether, as we go into unmanned missile field, which we certainly have to get into——

General GAVIN. Yes.

SUPPORTING FORCES WILL HAVE TO BE LARGER

Senator MUNDT. Because it means that in the overall we are going to have more men in the Army, for example, or less men in the Army?

General GAVIN. More men.

Senator MUNDT. More men?

General GAVIN. Absolutely.

Senator MUNDT. In other words, even though the missiles are unmanned, the supporting forces will have to be so large?

General GAVIN. Yes.

I believe all services have come to this conclusion. These missiles are very complex, and the missile is but a very small part of the complete system.

Consoles of computers, associated radars, electronics gear, tracking, fueling systems, fuel trailers, survey equipment, ordinary ground communications equipment—all of the things that go to make possible effective employment of missiles add up to manpower qualitatively and quantitatively superior to that which we have known in the past.

Senator MUNDT. Thank you, Mr. Chairman. I appreciate this opportunity.

I will be talking with the general again, I know, across the Appropriations Committee table.

Senator JOHNSON. Thank you, Senator Mundt. We are delighted to have had you with us, and we want to welcome you to all meetings of this committee.

Any other questions, Senator Stennis?

Senator Stennis. No questions.

Senator JOHNSON. Senator Symington?

Senator SYMINGTON. No, thank you, Mr. Chairman.

Senator JOHNSON. Counsel?

Mr. WEISL. I just want to join in my admiration for General Gavin.

Senator JOHNSON. General, did you read General Doolittle's testimony before this committee?

General GAVIN. I read it, but not with too much care. I went through it; yes, sir.

Senator JOHNSON. You saw his recommendations concerning the General Staff?

General GAVIN. Yes; I noticed that.

Senator JOHNSON. Do you find yourself in general agreement with him?

General GAVIN. Yes, I was. He was not specific.

Senator JOHNSON. I know.

As I gathered, he would retain the Joint Chiefs, and you would not; is that the general difference between you?

General GAVIN. Yes.

You understand, this is not in any way being critical of the Joint Chiefs. I would put the Joint Chiefs' competence up on the DOD staff, you see.

Senator JOHNSON. I didn't get that.

General GAVIN. I would put the Joint Chiefs' competence, that is, the Joint Intelligence Committee, Joint Logistics Committee, I would put that right under DOD, as part of his staff, and perhaps have the Chiefs remain as the senior military advisory group to the Secretary.

PLAN VERY CLOSE TO GENERAL DOOLITTLE'S

Senator JOHNSON. That would be somewhat the same plan General Doolittle outlined.

General GAVIN. Yes, it would be very close to it.

Senator JOHNSON. So both of you, in effect, are recommending the same thing?

General GAVIN. Essentially; and I arrived at mine quite independent of his. I wasn't aware of his.

Senator JOHNSON. General, you have been stimulating, refreshing, and inspiring.

It is a good time for the committee to take a recess until 10 o'clock tomorrow.

(Whereupon, at 9 p. m., the subcommittee recessed, to reconvene at 10 a. m., Saturday, December 14, 1957.)

INQUIRY INTO SATELLITE AND MISSILE PROGRAMS

SATURDAY, DECEMBER 14, 1957

UNITED STATES SENATE,
PREPAREDNESS INVESTIGATING SUBCOMMITTEE,
OF THE COMMITTEE ON ARMED SERVICES,
Washington, D. C.

The subcommittee met, pursuant to recess, at 10 a. m., in room 318, Senate Office Building, Senator Lyndon B. Johnson (chairman of the subcommittee), presiding.

Present: Senators Johnson (Texas), presiding, Stennis, Symington, Saltonstall, and Flanders. Senator Bush, member of the Committee on Armed Services.

Also present: Senator Carl Hayden (Arizona).

Edwin L. Weisl, chief counsel; Cyrus R. Vance, counsel; Gerald Siegel, associate counsel; Solis Horwitz, associate counsel; Daniel F. McGillicuddy, associate counsel; Stuart P. French, associate counsel; Dr. William Houston, consultant; and Dr. Edward C. Welsh, staff adviser.

Senator JOHNSON. The committee will come to order.

Before calling the first witness, I would like to express the gratitude of the committee to the scientists and the manufacturers who have been so frank and candid in their statements to us.

This is truly a time for frankness and candor. Nothing but the truth and the exact truth will serve the country in this time of peril. There are other scientists and manufacturers whom this committee has contacted or will contact. We have full and absolute confidence that they will respond in the same spirit because this committee needs information and the country needs information if it is to act intelligently and survive. The people who give that information must not be shackled. This committee intends, on its part, to see that that does not happen.

Events are moving rapidly. The newspapers this morning tell us that another country, Great Britain, may have solved the problem of controlling the energy of hydrogen. Science is advancing on a broad and rapid front. No nation has a monopoly on the creative genius necessary to advance civilization. Each nation has much to contribute toward that end. It becomes increasingly apparent that great advances which must be made come about only through hard work and through cooperation.

Our hearings today resume with further testimony from Army personnel.

Our first witness is another distinguished combat officer, Maj. Gen. John Bruce Medaris, who is commander of the Army Ballistic Missiles Agency.

General Medaris has had extensive experience both in and out of the military service, and he has commanded the Army Ballistic Missile Agency since November of 1955.

During the past 2 years our witness has been completely absorbed in the development of ballistic missiles at the United States Army Arsenal at Huntsville, Ala.

I am confident that he will contribute much detailed information about our missile program.

General Medaris is present, and if he will come to the stand, I will now administer the oath.

General Medaris, do you swear that the testimony you will give this committee will be the truth and nothing but the truth?

General MEDARIS. I do.

Senator JOHNSON. Be seated.

Counsel, will you proceed with the examination?

Mr. WEISL. Mr. Vance will examine General Medaris, Mr. Chairman.

Senator JOHNSON. Mr. Cyrus Vance, the associate counsel, will you proceed with the examination of the general.

(Biographical sketch of General Medaris is as follows:)

Maj. Gen. J. B. Medaris is commander of the Army Ballistic Missile Agency. His responsibilities include the development and establishment of the Redstone and intermediate-range ballistic missiles as weapons systems for the United States Army.

Born in Milford, Ohio, on May 12, 1902, he enlisted in the United States Marine Corps in 1918 and served in France during World War I.

In 1921, he was commissioned as a lieutenant of infantry and served with the 29th and 33d Infantry Regiments until detailed in the Ordnance Corps in 1926.

In October 1927, he resigned from the Army and for 10 years engaged in merchandising and management advisory activities in the business world.

In July 1939 he returned to active service and served successively until 1942 as executive officer, Cincinnati Ordnance District; assistant, district control office, Office Chief of Ordnance; executive, Contract Distribution Section, Office of the Under Secretary of War (with Secretary Patterson.)

In spring of 1942, he took to the field and was successively battalion commander; ordnance officer, II Corps—campaign in Tunisia, invasion of Sicily and Sicilian campaign.

Later he transferred to England as ordnance officer for the First Army and planned and executed ordnance portion of First Army's invasion of Normandy, remaining as ordnance officer for that Army's campaign in Europe.

After V-E Day, he served in turn as ordnance officer, Fifth Service Command; ordnance officer, Army Ground Forces; Chief, United States Army Mission to Argentina from 1949 to 1952.

Returning in June 1952, he became executive and Assistant Chief, Ammunition Branch, Industrial Division, and in May 1953 he became Chief of the Ammunition Branch, which position he held until his assignment as Assistant Chief of Ordnance and Chief of the Industrial Division of the Office, Chief of Ordnance, in November 1953.

He was promoted to the rank of major general on September 15, 1955.

In November 1955, he was designated as commanding general of the Army Ballistic Missile Agency.

Among the decorations he has been awarded are the Distinguished Service Medal (for the European invasion and the campaign following), the Legion of Merit, Bronze Star Medal, Soldier's Medal, and the French Legion of Honor.

TESTIMONY OF MAJ. GEN. JOHN B. MEDARIS, COMMANDER OF THE ARMY BALLISTIC MISSILE AGENCY

Mr. VANCE. General Medaris, you are the commander of the Army Ballistic Missile Agency, are you not?

General MEDARIS. That is correct.

Mr. VANCE. Would you tell us what the Army Ballistic Agency is?

General MEDARIS. The Army Ballistic Missile Agency is a tightly organized organization at the Redstone Arsenal in Huntsville, Ala., which has as its mission the development, production, and preparation for fielding of major ballistic missiles assigned to the Army as their responsibility, all of those over approximately 75 miles of range.

Mr. VANCE. Would you please give us a brief summary of your activities in ABMA?

General MEDARIS. The present activities of ABMA are primarily in two fields together with a great deal of forward planning.

In the 2 fields, I should say 3 now, of major activity, we are in the process of fielding the Redstone missile for the Army. We have the first of the combat groups that is to take the Redstone missile to the field. We have them in training and their equipment and the missiles to go with them are ready and they will shortly be deployed.

We have of course to supervise the production of the Redstone missile as a continuing objective, and its support in terms of maintenance and supply.

In addition to that, and the first priority mission of the agency at the present moment, is the completion of development and production of the Jupiter missile, the 1,500-mile missile together with its supporting equipment.

We also have a mission at the present time to launch a satellite, and we are engaged in those three activities primarily as continuing operations at the moment.

In addition to that of course we do a great deal of forward planning and forward engineering.

HISTORY OF ARMY'S DEVELOPMENT OF BALLISTIC MISSILES

Mr. VANCE. General, would you sketch briefly the history of the Army's development of ballistic missiles?

General MEDARIS. To take the whole Army development of ballistic missiles we have to go back quite a while.

The Army's interest in the missile field of course dates back to before and during World War II.

We took a great interest in the developments that were coming out against us, shall we say. I happen to have been in the target area of the first V-2 that was dropped, and so I remember this quite vividly. But at the close of the war the Army was responsible for bringing to this country a considerable group of the topnotch German scientists who had been responsible for the development and fielding of the German V-2.

They were taken to White Sands Proving Ground as a headquarters, and there began the initial operation to fire some of the V-2's that were captured to get more information about them.

It is appropriate here to say that the V-2 development when it was carried on in Germany was on such a crash basis that they did

not have much opportunity to find out why some of the things worked or why some of them did not work, and so at the first opportunity we wanted to fire a group of captured V-2's and bring the information up to date and get more information from them as to what the weak points were.

During this early period this group were also consultants to various segments of American industry that were interested in having a beginning in this field. Primarily this represented the present Rocketdyne division of North American Aviation. It wanted to begin on the rocket-engine business. General Electric was also an interested company at that time. And to both of these groups, as they began to get into these programs, this segment of German scientists were consultants.

During that period the research work in the upper atmosphere was carried on with such composite programs as the WAC Bumper or Bumper WAC, the WAC Corporal, and out of the development of the WAC Corporal grew the present Corporal missile, which is a ballistic missile. This was the first truly ballistic missile that was developed and fielded under Army sponsorship, and this was done primarily with the Jet Propulsion Laboratory of the California Institute of Technology.

Around 1950 it became obvious that the efforts of the Army required enlarged resources in terms of missiles in general, not only ballistic missiles but tactical missiles, antiaircraft missiles, and so forth. And at that time the present Redstone Arsenal site was selected as the base for all Army activities in the development and production of missiles.

The group headed by Dr. von Braun was moved there and resources began to be put together, at that time devoted to the Redstone program.

So from the Corporal and——

Senator JOHNSON. What was that date?

General MEDARIS. This is approximately 1950. I can look the exact date up.

Senator JOHNSON. That is all right.

General MEDARIS. It was April 15, 1950. At that time the Redstone program was moving along on a developmental basis. It went through several changes of orientation, largely due to certain uncertainties in the area of the nuclear weapons, in that it was difficult to forecast exactly what weights were required at that time for the nuclear weapons. And since the ballistic missiles all depend for their design on the payload that they have to carry, this became somewhat of a problem, and it was not until, finally, I believe, 1954 that the Redstone missile was launched purposely on its way, directed to its present destiny.

The Redstone missile was equipped with a rocket engine that had grown out of the work at North American Aviation, and it was in fact initially a refinement, improvement, of the V-2 engine. It has gone through a great deal of refinement since and is now very dependable, probably the most dependable rocket engine that we have.

The Redstone missile system was the focus of development in the ballistic missile field from 1954 until 1955, late 1955, at which time the Army launched into the development of Jupiter. There are a great many intervening dates with respect to recommendations and desires. It is interesting to note that the Redstone missile initially

was expected to be a missile of about 465 miles range. And due to the weight of the warhead that was contemplated, it was reorientated to its present range of 200 miles, because at that time it was deemed by the missile authorities of the Department of Defense that it would be easier, more practical to come out with it at its present range with that gross weight of warhead than to go for the 465-mile range.

For one reason or another we have not since had the opportunity to go for 465 miles.

Senator JOHNSON. Senator Saltonstall.

Senator SALTONSTALL. Would the counsel be willing to ask the general to elaborate a little further about the heavier warhead, how that was worked out and why it was worked out?

Mr. VANCE. General Medaris, you heard Senator Saltonstall's question. Would you please elaborate?

General MEDARIS. This is a rather difficult question to discuss in detail, gentlemen, in open session. It is a question of what was deemed to be the required yield for a heavy ballistic missile, and the forecasts at that time from the Atomic Energy Commission and their people as to within what weights these yields could be achieved. Now, of course, the progress since that time has been much more rapid, and it has turned out that the then predicted yields could be had with much lighter weights today. But at that time it was deemed that the heavy warhead of 3-plus tons was the essential for the performance that was deemed appropriate for this weapon.

As to those yields and so forth, of course, I would not discuss that in open meeting.

Mr. VANCE. Senator Saltonstall, is that satisfactory?

Please continue.

General MEDARIS. Generally speaking, in summary then the Army has been deeply in the ballistic missile field since the close of the war. It has attempted to cover the spectrum of weapons in that field. For one reason or another we have only part of the spectrum presently covered. As early as 1950, we were trying to go for approximately 500 miles range for the Redstone, and that portion of the spectrum is still uncovered.

Mr. Vance. General, would you tell us as much as you can consonant with national security about the Jupiter missile?

General MEDARIS. The Army back around 1954, I believe, knew that it could go for a 1,500-mile missile, and at that time I believe General Gavin made representations to the Chief of Staff that we should go out for it. However, the financial situation did not permit; the Army's resources were insufficient to go for it on a full basis. I don't know that it ever came to a question of whether we could or could not from the standpoint of authority, but at least the resources were not there to do so and it was determined that we would move on in a very orderly fashion through the Redstone into greater ranges.

Mr. VANCE. Might I interrupt for a minute. Was such a recommendation made to your knowledge?

General MEDARIS. This was in the Army. A recommendation was made to the then Chief of Staff of the Army but it was realized that the resources were insufficient to go on. I do not believe the recommendation ever got beyond the Army, although I cannot say that for certain. General Gavin would have to elaborate that point.

Mr. VANCE. All right.

General MEDARIS. Then in 1955, a specific recommendation was made after the Killian committee had determined that an intermediate-range missile was essential to the national security, a completely engineered proposal for a 1,500-mile missile was submitted, and culminated in late October of 1955 in the determination of the Secretary of Defense that the Army should proceed to develop a 1,500-mile missile for both sea-based and land-based use.

Its primary requirement at that time was to meet the needs of the Navy for a sea-based 1,500-mile missile and, as a second mission, so to speak, it was to be land based also.

Of course, these are completely compatible because obviously if you can satisfy the sea-based requirements, the land-based one is easy, as the sea-based missile would serve.

ARMY BALLISTIC MISSILE AGENCY ORGANIZED

It was at this time the agency I now command was inaugurated to give substance and force to the program, and it was separated from the balance of the missile program of the Army because of its unique situation.

It has an in-house capability to do prototype development and prototype tests and carry through to actual production of the missile; whereas in the balance of the missile work it is done by industry.

Mr. VANCE. What do you mean by "in-house capability"?

General MEDARIS. I mean in the Ballistic Missile Agency, with all the scientists we have, we can do the experimental, initial experimental and theoretical calculation, the construction and assembly of the early hardware, the prototype hardware, finally the flight testing of the missile, which is done at the Air Force missile test center in Florida, but under our own firing crew who are part of our laboratories, and finally we can produce in limited quantities those missiles, as we did initially for the Redstone. It (Redstone) was then phased over to industry when the engineering development was complete.

What I mean by an in-house capability, this can be done by our own close group in one place, all of whom are Government employees.

Mr. VANCE. Please continue.

General MEDARIS. Then this project was launched formally and very forcefully at this time, and this was late 1955. The agency actually took its official form on February 1, 1956, although I was named as the commander designate in October of 1955; and had the supervision of the program from that time on.

We continued with primary emphasis on the Navy's requirement, which involved some rather tough problems which we were able to solve; and coincidentally we continued the engineering necessary to assure that the missile would meet the land mobile requirement as well as the sea requirement.

In the summer of 1956, the Navy decided, for its own proper reasons, that it could afford better the delay consequent upon going for a much further advanced atomic warhead, plus a much further advanced solid propellant missile, in order to accommodate them aboard submarines, and they decided as a matter of resources that the continuation of both programs coincidentally was not in their interest due to ship costs. In order to accomplish the result and make it effective, they decided to drop out of the Jupiter program and focus all of their energies on what

is now the Polaris program, recognizing when they did so that they were facing a considerably greater delay in being able to field a weapon, but feeling this was highly justified in view of their urgent requirement for that type of missile.

Senator SALTONSTALL. What was that date?

General MEDARIS. Of course, this occurred over a period of months in the middle of 1956. We will look up here the exact date of the final directive which severed the Navy interest in the program.

Following that, we continued with the development of the Jupiter as a land-based weapon only.

The final confirmation of the Navy's complete dropout was as of December 10, 1956, but it was a known fact in the fall, in early fall, that the Polaris program was underway.

Following that, we continued with the development of the Jupiter on what we believed and believe today to be the optimum time scale for an effective weapon, developing it for land-based use, based on a mobile concept, which we had found to be highly practical with the Redstone missile.

In late November of 1956, as you gentlemen remember, the decision was finally made as to who was to employ the weapon. Before that time, it had been an open development problem without final decision as to who was to have the employment; and in late 1956, the Secretary of Defense issued a memorandum in which he charged the operational aspects of the intermediate range ballistic missile to the Air Force.

This put us in the position, of course, where we were then to develop a weapon which, if and when used, would be used by the Air Force, and from that time on we continued our efforts trying to find out as much as we could about the Air Force intended method of deployment, and trying to orient the development of it in such a way that it would be acceptable to them.

But we did not slacken our efforts in any respect. There was no decision, during any of that time, to discontinue the development of Jupiter, although it would appear psychologically to have been threatened several times, and we so felt.

However, we continued without letup. We fired the first Jupiter test missiles in their proper configuration some 2 months prior to the date that we had predicted, in December of 1955, that we would fire them, and we continued with our program ahead of schedule to the present time. Every missile in the Jupiter missile up to date has been fired on or ahead of the date predicted in 1955.

Mr. VANCE. General, just a second. You said they were fired in proper configuration. What do you mean by that?

General MEDARIS. I mean we had other test missiles which carried other Jupiter names, like Jupiter-A and Jupiter-C, which carried those names simply because they were supporting elements of the Jupiter program. And when I say the proper configuration, I mean the Jupiter itself in the configuration which would carry the Jupiter warhead and would successfully perform its mission.

Mr. VANCE. Thank you. Please continue.

General MEDARIS. There were many other problems. It is a long story, of course, and if I go into too much detail, please let me know.

Mr. VANCE. Go right ahead.

General MEDARIS. But to relate other facts that go along with it.

Early or in the middle of 1955, the Army, the same organization, had also been involved with, jointly with, the Navy in the question of a possible scientific satellite, and under the term "Project Orbiter," had put in a proposal for launching such instrumented satellites of approximately 19 pounds instrumented weight.

Mr. VANCE. When was that proposal made, General?

General MEDARIS. That proposal was made in the early fall of 1955, the first proposal on Orbiter. I will have the date for you in just a moment, Mr. Vance.

It must have been a little earlier than that. We will get the date before this, because it was in August 1955 that the committee that had been appointed to determine what was to be done in the satellite field for the IGY determined that the Vanguard project was to be used instead, and stopped the work, canceled out the Orbiter.

Mr. VANCE. What committee was that, General?

General MEDARIS. This was the so-called Stewart committee. It was a committee appointed as a panel, I believe, of the National Research Foundation, and operating, however, within the framework of the Defense Department, made its recommendations to the Department of Defense, and the decision emanated from the Department of Defense to terminate Orbiter and go into Vanguard.

I had better fill in these dates a little bit more accurately for my chronology. It was on the 15th of September 1954, that the first report on the practicality of a satellite was issued by Dr. von Braun's group, and this was proposed to be done on the basis of components that were available to the Ordnance Corps.

And on the 14th of December, 1954, a memorandum was directed to the Navy with respect to this capability, and it was as a result of that memorandum that the two got together, the Navy and the Army, on the question of Project Orbiter, and that name was used at that time.

PROJECT ORBITER DROPPED

Then, there was a presentation to the Army Policy Council on August 3, 1955, and the schedule of the Orbiter was turned out at that time. They were told what could be done. And in August of 1955, the Homer J. Stewart—the ad hoc committee on special capabilities was the title of it, made a report in which they approved the Vanguard project, and as a result of that report, Project Orbiter was stopped.

Senator SALTONSTALL. Which was stopped?

General MEDARIS. The project then called Project Orbiter, which was the original Army-Navy proposal, the proposal based on Dr. von Braun's project for a scientific satellite. It was then called Project Orbiter.

Mr. VANCE. And that project contemplated using the Jupiter missile?

General MEDARIS. No; that project contemplated using what is now known as the Jupiter-C missile, which, as I mentioned before—to keep out of confusion, let's get these straight. The Jupiter-C missile is not a Jupiter at all, but it is named Jupiter-C because of the fact that the missions that it has had have been missions in the Jupiter program. And therefore, we keep the names related, with sub-numbers, in order that they are submitted in the project papers all together.

And this Project Orbiter contemplated the use of the Redstone as the booster missile, with upper stages of solid propellants in essentially the form that is now Jupiter-C.

I relate this in connection with the Jupiter program because the outgrowth of this Project Orbiter became the reentry test vehicle for the Jupiter program, and when the Jupiter program was assigned in late 1955, one of the problems that we knew had to be solved was the problem of reentry.

Now, there are many more problems involved in that field than just the question of getting through the heat barrier. There are ways of getting through the heat barrier, as there are ways of doing anything else. There are ways to do it by brute force, and there are ways to do it with finesse.

The problem is to get through it efficiently, to have the proper protection for your components, to do it with minimum weight, and at the same time to disturb the accuracy of the inbound missile the least possible amount.

You can vary all these factors together, and find many solutions. If you want to accept a greater inaccuracy, a greater drift on the down dive, you can reduce the heat input and therefore the problem becomes easier.

If you want to use more weight, the problem becomes easier. This is a problem of getting the most efficient head with the least weight; and in order to solve that problem it was the recommendation of Dr. von Braun, and with my approval, that we use the same test vehicle that had already been engineered and designed for Project Orbiter, and by eliminating the fourth stage we could then put a scale model of such type that the heat effects would be the same, exactly, as they would be on the final Jupiter head; we could put a scale model through a flight condition that would duplicate those reentry problems, and it was believed that we could recover it, that it could have a proper gear inside by which it could be recovered. And the physical recovery of such a head we believe to be highly important.

This relates primarily to the problem of weight, because by physical recovery you determine exactly how much of your protection material has been used, and this, in turn, permits you to reduce the weight to the absolute minimum, because you can cut off everything except what you needed for that protection and leave only a paper-thin covering below it, and you are all right.

But if you can't determine exactly how much has been used under these conditions, you must allow a safety factor, and that adds more weight.

So we then took this Project Orbiter and turned it into Jupiter-C, intended for this purpose.

Now, the initial engineering, complete, of course, had been on the basis of launching a satellite, and it takes time to reengineer any element of a missile system. They are not independent; they have to be done all together, and they have to be done carefully. And so, in order to test the propulsion system and the principle of the liquid first stage and the solid upper stages, the first flight of a test missile of this type was in September of 1956.

And this was flown actually in the satellite configuration, although the fourth stage was not loaded, but the configuration was not changed because we had not had time to do the engineering, and still do it that early.

Meantime, we were engineering the changes necessary to put the protected, scaled down head aboard. This test was highly successful; because of the low weight of the projectile, so-called, in it, why, it flew some 3,000 miles instead of the 1,500 that would be the target for the final reentry test. It was a matter of weight entirely, and the same vehicle was used.

Following that we came up with two reentry flights in the reentry head configuration (or nose cone configuration) both intended for recovery. The first was not recovered. It landed outside of the area where recovery had been fully prepared. This was due to a deviation in direction when it finally took off with the last two stages. And although we knew it lived and came through and got into the water in good shape, nobody could get to it in time to recover it.

Actually, we believe the sharks got the balloon as a matter of fact because of a number of them we found around the second one when we got to that.

NOSE CONE EXHIBITED ON TV BY PRESIDENT

But somewhat later we came up with the second such flight, and this one was successful—fully successful. The nose cone was recovered and this was the nose cone, of course, that the President had on TV not long ago. This fully satisfied the conditions of the initial test for the reentry solution which we had believed would work in connection with the Jupiter program.

In view of the fact that we were shortly going to fly full-scale Jupiter nose cones with this reentry protection, we could see no further purpose in the reentry test program, so the balance of it was canceled and the hardware was put on the shelf. This hardware becomes the basis for the Army's present project in the satellite field. That hardware that was prepared for the reentry program now becomes the basis for launching the satellites which we have been directed to launch.

Another element of interest, I think, in connection with the Jupiter program has been the fact that having the Redstone missile on its way into deployment and production at that time, and having it in a very dependable flight stage, it became the means for test flying many of the components for the Jupiter system in advance.

For example, here is one component—the angle of attack meter which we used to provide stability in the rise phase to an unstable missile—were flown many times on Redstone missiles before we had Jupiter hardware to put them on. Now they are being flown on Jupiter, of course, but this gave us many months lead.

Since it is, the Jupiter is, in fact, a second generation missile based on the Redstone, we are still using some 70 percent in number of components based on those that were on Redstone.

I believe that brings the Jupiter program up to date, sir.

Mr. VANCE. With respect to the Jupiter program, what priority did that get when it was started in 1955?

General MEDARIS. When the Jupiter program was started in 1955, it shared the highest national priority with the Thor, the Atlas, and the Titan.

Mr. VANCE. What limitations or restrictions have been placed on the Jupiter program?

General MEDARIS. The primary limitation on the program, I think, has been one of uncertainty. It has been a psychological limitation

rather than a factual limitation. We have managed, I believe, to protect ourselves against it to the point where we certainly haven't lost anything on our time scale. And since our time scale and point of development today is up to or ahead of that which we predicted in 1955, I would not be in very good grace if I said there had been a great many obstacles put in the way of it.

However, there has been a psychological handicap because of the continuing uncertainty that has been present with respect to the ultimate destiny of the program.

Senator JOHNSON. Are you saying, General, that you made as much progress as you think was possible?

General MEDARIS. Mr. Chairman, we set the original program on the basis of what we considered to be an optimum development schedule. This leads into a development philosophy. It leads into the point where, in the considered judgment of the engineers, if you go faster you are simply spinning your wheels, if you go slower you are wasting time.

Our original development schedule was laid out on what we believed to be an optimum time scale, and I might say that when we ourselves are satisfied that the present designs we have can be released into production as a sound missile design, and when that decision on our part is only 2 years behind the initial project approval, I do not think you are going to beat that much with anything.

Senator JOHNSON. Now, answer my question very briefly so I can understand your answer. Could you have done a better job? Could you have gone faster, in your opinion, yes or no?

General MEDARIS. I doubt it.

Senator JOHNSON. Thank you.

Mr. VANCE. General, is it not a fact that a directive was issued in August of 1957 which limited production of Jupiter missiles and ground support equipment?

General MEDARIS. That is true, that is true. However, this limitation on the number of Jupiters that we could produce would have had an effective date a year or more after that, because of the fact that what you start at that point does not come out until that time in the future. And so up to this present moment that has had no restriction on the speed of the program.

Mr. VANCE. Will it in the future?

General MEDARIS. It may, although it will be very hard to tell, because of the fact that this only means the difference in how many test missiles we are flying at a time when we have already flown our prototype missile and are merely in the stage of product improvement and tests of reliability.

That is the first place that the numbers that we would be flying for development purposes would be affected by that directive. And at that point if we have been successful with everything up to there, we can hardly say that it will have affected it. However, you will never be able to know.

Mr. VANCE. Is it your testimony then that this restriction did not in the past and will not in the future restrict the development of the Jupiter missile?

General MEDARIS. I am not going to be quite that positive with it. I say that it did not in the past because we have not gotten to the time that would have been affected by it, and I also say that I do

not believe we can ever tell whether the future will have been affected by it or not.

Mr. VANCE. Did you protest or recommend against this restriction? General MEDARIS. Definitely.

Mr. VANCE. Why?

General MEDARIS. Because in my opinion the important element for any development program is a continuity of operation against a single set of guidelines without any restrictions that are either psychological, financial, or administrative. So I protest anything that gets in the way of moving a program as fast as we believe we can move it soundly, just as a matter of principle.

Mr. VANCE. Then why do you testify now that you do not believe that this has had or will have a restrictive effect on the program?

General MEDARIS. I am sorry, Mr. Vance, I did not say that I would testify that it will not have any restriction on it. I can say it has not had because the effect of that would not have been felt until next fall, the fall of 1958, and by that time it will be difficult to tell.

Now, as a matter of fact, when I say that there has been no restriction, I will mean it that way. If I say there has been, I expect to be able to support it with absolute fact; and in this case I cannot support the statement that this restriction has a delaying effect because its effect will not be known for another 9 months or so, and then will be difficult to determine.

Mr. VANCE. Then you have no opinion now?

General MEDARIS. At the present time I know that we have not allowed it to affect us up to now, and I believe if we are successful with everything we do in the next 6 months, which we expect to be, that it will have no definite effect on the final program. It did not last very long. If it had, it would have.

Mr. VANCE. How long did it last, General?

General MEDARIS. It lasted until—in the middle of September after the deliberations of the ad hoc committee in Washington—

AD HOC COMMITTEE EXAMINED INTO MERITS OF MISSILES

Mr. VANCE. What is the ad hoc committee?

General MEDARIS. The ad hoc committee was composed of Mr. Holaday, General Schriever of the Air Force and myself as the Army representative, and was to examine into the relative merits of the Jupiter and Thor and attempt to come up with a solution as to whether they could be married, and if not, which one should be canceled.

Mr. VANCE. That committee is also known as the Jupiter-Thor committee?

General MEDARIS. That is correct. After the deliberations of that committee, we were instructed to go ahead with the development of a complete missile system for Jupiter, and at that point the restriction on the numbers of missiles for development purposes was lifted, so that actually the restriction only lasted about 6 weeks.

Mr. VANCE. And the restriction was lifted as a result of your protest?

General MEDARIS. The restriction was lifted as a result of the deliberations of the committee, and obviously my very vociferous

statement at that time during the committee that we should be under no handicaps that were not equally laid on the Thor program.

Mr. VANCE. General, the same directive put a restriction on the use of overtime, did it not?

General MEDARIS. Not that same directive. The overtime restrictions—it was quoted in that directive but the overtime restrictions were—actually imposed separately, and they were in terms of, I believe, 3 percent on a program basis, which meant that across the board—contractors and in our own in-house operations—as a total we could use 3 percent of productive man-hours for overtime.

Mr. VANCE. When was the overtime restriction put into effect?

General MEDARIS. I never did put it into effect.

Mr. VANCE. I want to ask you about that in a minute.

General MEDARIS. This was August 13. There was a memorandum for the Secretary of the Army from the Secretary of Defense on the subject of the IRBM program dated the 13th of August.

Mr. VANCE. What year?

General MEDARIS. 1957, which gave this basis of 3 percent on a program basis across the board.

Mr. VANCE. General, you said that you never did put the overtime restriction into effect. Would you please amplify?

General MEDARIS. Yes, sir. The fact is that I immediately took a reclama from the position and cited the most extensive facts and figures as to the position that I was put in by having both a limitation on manpower which had been imposed on ABMA at a total of 4,100 and a limitation on overtime, and I merely stated the obvious fact that the two together simply put a total limit on effort.

Mr. VANCE. So in effect you recommended against and protested the overtime restrictions?

General MEDARIS. I did and the Army carried those protests on up to the Secretary of Defense, and the actions relieving that overtime came as an answer to that reclama and in the meantime as long as I have got an appeal in court I don't go to jail, so I did not stop the overtime.

Mr. VANCE. When were those restrictions lifted, General?

General MEDARIS. They were approximately coincidental.

Oh, yes, I remember that now. That was the last thing that Secretary Wilson did. The last day that he went out of office he announced that he had lifted all the overtime restrictions on ABMA.

I think we can find that date. It was approximately the first week in October. I think it was the eighth or ninth of October.

Mr. VANCE. Of what year, General?

General MEDARIS. 1957.

Mr. VANCE. And that overtime restriction, General, was it on development overtime or production overtime?

General MEDARIS. This was on both. This 3 percent was across the board on what is known as a program basis.

In other words, it applied to all activities under the Jupiter program.

Now there was an escape clause in it with respect to the activities of the firing units down at Cape Canaveral, in that we were allowed, I think the wording was that a reasonable amount in excess of that 3 percent when required to support unusual test operations and flight test schedules would be allowed.

Mr. VANCE. General, I wonder if you would submit for the record all documents relating to the restriction of overtime.

General MEDARIS. We will be glad to.

(Information requested of General Medaris is included in the classified records of the subcommittee.)

Mr. VANCE. General, was the restriction lifted after Sputnik I went up?

General MEDARIS. I believe it was about 4 days after Sputnik I went up; yes, sir.

Mr. VANCE. Was it completely lifted?

General MEDARIS. Yes.

Mr. VANCE. No percentage restrictions?

General MEDARIS. No percentage restriction was imposed.

It was taken off as a blanket—

Senator JOHNSON. In your opinion did sputnik have anything to do with it?

General MEDARIS. Mr. Chairman, I would hate to answer that question because it would be just—

Senator JOHNSON. That would be a very difficult question.

General MEDARIS. It would be just one man's guess. I don't know all the elements that entered into that decision.

We had put a great deal of pressure in the Army on the relief of this restriction prior to that time, and what the current events of that day had to do with it I would not want to guess.

Senator JOHNSON. You would say that you have had considerable more action in the Sputnik I and Sputnik II periods than you did before even with these pressures you were putting on to get these restrictions lifted?

General MEDARIS. Yes; I could say that very definitely.

Senator JOHNSON. Thank you very much. I appreciate your frankness.

UNCERTAINTY ABOUT JUPITER PROGRAM

Mr. VANCE. General, what bottlenecks were there with respect to the Jupiter program; or are there any now?

General MEDARIS. The primary bottleneck throughout the entire Jupiter program can hardly be called a bottleneck. It is more in the nature of an impediment, it has been that of uncertainty, it has been the fact that the program was under constant examination for possible cancellation.

We had lifetimes given to us that varied from 5 months at the beginning to as low as 45 days that we were looking forward to as the lifetime of the project possibly, and this has a very profound psychological effect naturally.

It was also this uncertainty which led to the fixing of the limit of personnel at the agency to 4,100, the view being that if the project were canceled, this would be the maximum number of people that we could devote to other purposes, and avoid having an unstable employment situation.

Mr. VANCE. May I interrupt a minute?

If there had not been that uncertainty, you would have been able to use more personnel and get ahead faster.

General MEDARIS. Oh, yes, sir, I would have had less overtime and I would have had more people on the payroll and therefore I would have had a reserve of effort to meet unknown contingencies.

Now as to the latter part that I could have done it faster, I could have done it more intelligently, but I don't think we could have done it any faster because we have kept our schedule by superhuman effort, but it has taken superhuman effort on the part of our people to do it.

Mr. VANCE. But could you have accelerated your schedule if you had more people?

General MEDARIS. I don't believe so. I still believe that the time basis of our schedule is the optimum for the development of a missile.

Mr. VANCE. Would you please continue with your description of the other bottlenecks which existed or still exist?

General MEDARIS. This and associated with it, short-time funding which of course does go along with an uncertainty of decision also has been in our way. It has not let us get the rolling momentum for the future that we wanted.

Now none of these have registered during the early portions of the development program. When they begin to take hold is when you should have your speed accelerating and generating a faster move out to production and deployment.

You should have all the actions underway that are going out there.

Mr. VANCE. So that these restrictions or bottlenecks may have an effect in the future?

General MEDARIS. They may. They may still have an effect, although they have now in large part been removed.

Mr. VANCE. What is your opinion? Will they?

General MEDARIS. In my opinion they will have some effect; yes. It won't be a great deal because again, as we always have, we bend every effort we can to make up for whatever handicaps or checks have been thrown into it, and we tire people out and wear them out but we get it done.

Mr. VANCE. Are there any other bottlenecks?

General MEDARIS. I think inherently in the whole process is the decision-time element, the time required to get decisions as definitive approvals or guidelines on which to proceed.

This was obvious in the early phases of the program because the first decision gave us a running start on a program and certain program approvals, but it has affected the availability of facilities for the use of my agency and my people down there, test facilities and laboratory facilities.

It has taken a great deal of time to get final decisions which could be accepted as guidelines. Again you cannot put a quantitative measure of time on this because we do our work in shacks until we get the proper thing to put it in.

How much time have we lost, I don't know.

Mr. VANCE. At what level was this lack of decision?

General MEDARIS. It is all outside the Army, I will tell you that.

Mr. VANCE. Then it was in the Defense Department?

General MEDARIS. They have the authority; yes, sir.

Mr. VANCE. Are there any other bottlenecks that have existed or still exist?

General MEDARIS. I think those are the primary ones.

I don't know of any others. Of course the Secretary of the Army has delegated to me every authority that he has the privilege by law to delegate, and so we have no local handicaps.

We have no handicap, in other words, in the use of our resources once those resources are approved to us, and our line of approach is approved.

Mr. VANCE. General, I would like to read to you from a telegram from Mr. Ernst Stuhlinger, which was received in response to questions sent to him by the staff of this committee, and then ask for your comments.

Mr. Stuhlinger says:

Decisive bottlenecks encountered during recent years of the Army Ballistic Missile Agency were caused rather by the lack of a clear-cut assignment of an IRBM or satellite project, by the uncertainty whether IRBM work could be carried on or discontinued soon, by the lack of manpower, funds, and assignment for supporting research.

Do you agree with that?

General MEDARIS. I agree definitely with these first two points, and I agree with some minor qualifications to his third.

Mr. VANCE. Would you please state your qualifications with respect to the third?

General MEDARIS. I have already discussed with you the effect of the manpower limitation, and while I recognize that it has been in the nature of a hammer over the heads of these people during this period, it has been overcome by the continued use of overtime and by other means, and I really believe that what Dr. Stuhlinger is talking about again is this question of the psychological holdback.

RESEARCH LIMITED TO DEFINITIVE PROGRAM

Now in the research area there is no question that there is a limit to our authority to engage in research activities beyond the definitive program in which we are engaged.

This is all the time and this is one of the basic problems in the whole business of getting on with the development of modern weapons, because it impedes the whole works.

How much it impedes ours alone I don't know.

Mr. VANCE. Do you feel that should be corrected?

General MEDARIS. I feel it has to be corrected, because if you wait until the time when you can envisage a final product to go ahead and break the barriers and develop all the pieces that go into that product, you are going to be late, and you are always going to be late; you will never get caught up on that basis.

Mr. VANCE. In your opinion, General, how should it be corrected?

THE WAY TO CORRECT THE SITUATION

General MEDARIS. Well, as soon as you can see your way to an advance in the state of the art or to an investigation into the possibility of an advance in the state of the art in any of the primary elements that contribute to advanced weapons systems, such as propulsion systems, guidance systems, nose-cone systems, new structural methods, and all that, it should be possible to go ahead and develop that particular item, break the bottlenecks, get into the question of what new scientific principles have to be worked out or what engineering developments are required, and get on with it, so that when you can see from the whole state of the art that you can have a new weapon, you have already got the advances made in the subordinate areas.

I give you as a key point the fact that one of the great holes in the ballistic-missile business today is that there is no big-thrust ballistic engine or rocket engine under development. There should have been as much as 2 or 3 years ago.

Mr. VANCE. Was that recommended, General?

General MEDARIS. It was.

Senator FLANDERS. Excuse me, Mr. Chairman.

I did not get that statement from the General, and I would like to have him repeat it.

General MEDARIS. Thank you, sir. The fact is that there is no high-thrust advanced big rocket engine under development today.

Senator FLANDERS. High what?

General MEDARIS. High thrust.

Senator FLANDERS. Thrust?

General MEDARIS. Yes, sir.

Mr. VANCE. And you said that you had recommended such a project?

General MEDARIS. Yes, sir. As a matter of fact, in the summer of 1956, there was a committee headed by Mr. Silverstein that was to look into the need of the Department of Defense for new engines. We made specific recommendations at that time that we be allowed to develop, and this was a very modest request but we felt we couldn't get away with any more, an engine of approximately 220,000 pounds thrust.

It turned out——

Senator JOHNSON. Do you regard the failure to act favorably on that decision as very much against our national interest?

General MEDARIS. I would rather put it in another way, Mr. Chairman. I don't even think that that recommendation was as forward-looking as it should be, should have been, but we felt that this was the most that we could possibly get away with, so we limited it to that.

The fact is that there is in the engineering stage at North American, but in the engineering stage, an engine of much higher thrust.

Senator JOHNSON. I just want to point out where all of us can understand it, whatever you tried to get away with which you thought was extremely modest, you did not get away with?

General MEDARIS. That is correct.

Senator JOHNSON. And the fact you did not get away with it resulted in certainly loss of prestige, if not in possible loss of life and limb?

General MEDARIS. It will impede future programs, let's put it that way. We cannot go along with future fields the way we should, because we won't have high thrust.

Senator JOHNSON. We want to lay it on the line here and let the country have the facts, and I find it is very difficult to get—to pinpoint these things and get them in shape where the country can understand them. And you did make a very modest recommendation, you tried to get away with it, and you did not. That is the net of what you are saying?

General MEDARIS. That is right, yes, sir.

May I try to clarify this thing a little bit more?

Senator JOHNSON. Thank you.

Mr. VANCE. Please do.

General MEDARIS. The fact is that the engines that are being developed today are those required for Jupiter, Thor, Atlas, and Titan. Beyond that, for some future use now unknown, there is no high-powered development project on a rocket engine.

There is one of substantially greater thrust that is in the engineering stage at North American at Rocketdyne, which should be being carried out on a crash basis; and instead of that it is coasting along on an engineering basis, the reason being that nobody can put down their finger today on the specific project for which they need that engine.

Now, this is what I mean by advancing the applied research in the various areas of tools that are needed for future weapons.

TURNED DOWN BECAUSE THEY COULDN'T PROVE ENGINE WAS NEEDED FOR JUPITER

The reason we were turned down on our modest request is that we couldn't prove we needed it for Jupiter, and as long as we couldn't prove we needed it for Jupiter, we couldn't get it.

This is one thing which has to be changed if we are going to make the progress in these fields that we should make, and that we can make, and that is, we have to get the pieces, the tools of the trade, out ahead of the actual final end product that we intend to put in use. We have got to develop engines and guidance systems, and those things, (even if we don't know what we are going to do with them today); because just as sure as they come through, by that time there will be plenty of use for them, and you have got to get down the road.

Senator JOHNSON. Is the kind of engine you recommended the same kind the Russians used in launching their 1,000-pound satellite?

General MEDARIS. I believe it is about the same caliber as the one they used in the first stage; that is my analysis from all the knowledge we have available.

Senator JOHNSON. So you would substitute a crash program for the coasting?

General MEDARIS. I certainly would.

Of course, I don't like to use the word "crash," because I think—

Senator JOHNSON. I gather you do not, but you are getting down now to where you are telling us now what we want to hear, what we want to know, what we have to do, what we have to face up to. And if you will just do that and put it on the record here, this committee will do something about it.

General MEDARIS. I am perfectly willing to go on the record on all of these, Mr. Chairman.

Senator JOHNSON. All right.

Go ahead, Counsel.

General MEDARIS. I only want to be sure I am understood and not misinterpreted. The reason I don't like the word "crash" is because the usual connotations of a crash program mean the scattering of a lot of money all over the country to do a lot of things because you don't know exactly what you do want to do.

Now, that kind of crash program I don't believe in. The kind of program I do believe in, and that I believe we should be doing, is the kind that has ahead of it all the time an objective that is way out of reach, that has enough money to keep rolling as fast as it can roll

with sound, commonsense and good scientific and engineering judgment behind it.

This is the kind of program I recommend, and I don't like to call it a crash program, because that usually means you get 6 people to do a job that 1 person can do.

Senator JOHNSON. The record will show that you used the word "crash." It is your word.

General MEDARIS. Very well, sir.

Senator JOHNSON. And let the record show you have defined it, given your definition of "crash."

General MEDARIS. Yes, sir.

Senator JOHNSON. And let the record show that you were denied the kind of program that you asked for.

General MEDARIS. That is right.

Senator JOHNSON. According to your definition.

General MEDARIS. That is right, sir.

Senator JOHNSON. If you do not want to talk about a "crash" program you can quit talking about it. We will talk about something else.

General MEDARIS. I will let it ride with that.

Senator JOHNSON. But you used the comparison that it should have been crash and it was coasting.

General MEDARIS. Yes.

Senator JOHNSON. And then you put in some connecting thoughts there, and I tried to separate them and get to the meat of the thing.

General MEDARIS. I was referring now in these statements to this matter of a bigger engine.

Senator JOHNSON. I think it is a very important statement you make, and I am glad you are making it.

Counsel, proceed; and I apologize for interrupting.

Mr. VANCE. General, is the Redstone program under your supervision and direction?

General MEDARIS. It is.

Mr. VANCE. As I understood General Gavin's testimony last evening, he said that he felt that that program had not been able to go forward as fast as it should. Do you agree with that?

General MEDARIS. I think that is right. I think we could have put it out faster if we had more resources devoted to it.

Mr. VANCE. And you feel it should go forward as fast as possible?

General MEDARIS. It should have been out the day before yesterday, that is right.

Mr. VANCE. What are the factors that caused it to be impeded?

General MEDARIS. Well, again, there was a great debate over whether the Army needed it or not, and this debate took sometime before it could be launched into actual production and fielded.

Then it is a question of the rate at which you put it out, and this was fixed by decisions affecting the amount of resources that could be devoted to it.

I think you will find that we were putting out about half the numbers in quantitative speed that the Army recommended.

Mr. VANCE. When, General, did the Army recommend this?

General MEDARIS. This is about a year ago that they recommended an upping of the quantity on it.

Mr. VANCE. And to whom did the Army make that recommendation?

General MEDARIS. To the Department of Defense in connection with budgetary procedures.

Mr. VANCE. Was that recommendation turned down?

General MEDARIS. Apparently it was. I haven't seen the documents myself, but I was told that we would have to remain at the present rates.

Mr. VANCE. Are there any other factors which have impeded the development of the Redstone program?

General MEDARIS. Not at the present time.

Mr. VANCE. How about in the past, General?

General MEDARIS. Well, originally, of course, in the climate of 1950-51 and before that, because it was 1950 when it was finally approved as a system—there were a couple of changes in objectives that had something to do with it—1951, in the last quarter of 1950 and then again on the 15th of March, 1951, the Army proposed certain rates, which I would rather not discuss openly, for the advance of the Redstone program and the testing of that program leading to production.

And on the 13th of April, 1951, the program was approved in somewhat less than—at about three-quarters the number of missiles, total missiles, for test purposes, and with an immediate limitation to a quite minor number for flight test, and with some very inadequate funds.

Then the Army, however, supported that a little further with some procurement production funds for hardware, and we got out with the first group of missiles.

Now, this was 1951, the first quarter of 1951.

And then it was reviewed again in April. In May the program was reoriented, and, now, it was accelerated again in May. This was in April that it was approved for a lesser amount and some lesser funds. In May it was put back up to the original speed, but—

Mr. VANCE. May I interrupt a moment, General? Was that as a result of the recommendation on your part or the Army that it be accelerated?

General MEDARIS. This was as a result of an Army recommendation, after an Army study on the subject; and then, because of the type of thing that I am talking about before, that the engine doesn't get out ahead of the program, in the last of 1951 it was, it had to be slowed up a little bit because engines were not going to be available fast enough to support it, from North American.

Then on the 26th of November of 1952, the project directors pointed out that the approved schedule could not be realized as an accelerated program with the reduced funds that had been made available for fiscal years 1953 and projected for 1954 and 1955.

Mr. VANCE. Who allocated those funds please, General?

General MEDARIS. Those were allocated from the Department of Defense.

Mr. VANCE. Who, in the Department of Defense, General?

General MEDARIS. I would presume, I think the process was the same as it is now, and I think the committee is aware of the apportionment process and the way the funds are set down to the Army through the channels of the Comptroller.

They are based on the recommendations of, the desires of the Secretary as to what he wants to have done.

Mr. VANCE. General, were you connected with that program at the time?

General MEDARIS. I was connected with it in a different capacity than I am now. I was not the project director.

At that time I was in the Office of the Chief of Ordnance, and I was in and had control of the staff section in the industrial area of the Office, Chief of Ordnance, that handled the processing of all of these projects to the top staff and to the Department of Defense and clears the way for the project directors in the field so I was fully familiar with the program, and in that sense was in it, yes.

Mr. VANCE. And a protest was made at that time?

General MEDARIS. In each and every case that we got less than we asked for, it was also reclama'd, and sometimes we came back with a split the difference and sometimes we did not get anything out of the reclama.

Of course with the inauguration of the Jupiter program and the requirement for Redstone missiles as flight test missiles to support Jupiter, the firings of Redstone were then accelerated under the Jupiter-A program to carry more components for Jupiter because of the higher priority.

Mr. VANCE. Is it your testimony now, General, that that program is not proceeding as fast as it should and that it should be accelerated?

General MEDARIS. It is my feeling that on a time basis for deployment that it is proceeding at the moment about as fast as it can, but that the future roll-on of the program is not at a level that it should be.

It should be approximately twice what it is now.

Mr. VANCE. General, are the Nike-Hercules and the Nike-Zeus, being manufactured or developed, at the Army Ballistic Missile Agency?

General MEDARIS. No, sir.

Mr. VANCE. So they are not within your jurisdiction?

General MEDARIS. No, sir.

Mr. VANCE. Now the satellite program, however, is within your jurisdiction?

General MEDARIS. That is correct.

Mr. VANCE. And as I understand it you have now been authorized to go ahead with a small satellite?

General MEDARIS. That is right.

Mr. VANCE. I am not going to ask you about the date.

General MEDARIS. I am thankful for that, sir.

Mr. VANCE. General, is it correct that at one point when express orders were sent down to the Army not to launch a satellite, auditors from the Budget Bureau checked on your agency to make certain that the orders were obeyed?

General MEDARIS. I don't remember what bureau they came from but I know there were some people who came down to take a look and to be sure that I was not fudging.

Mr. VANCE. General Gavin has said that he believes that satellites should be given greater priority than ballistic missiles.

Do you agree with that statement?

General MEDARIS. I would not want to limit it to satellites.

I feel that the priority should always be on the furthest thing out that you can conceive as a possibility and each thing closer in should be relatively, shall we say of, slightly lesser priority.

The furthest away that you can attain—the priority today should be on the attainment of a space capability by the United States at the earliest possible date.

Now you get all your ballistic missiles if you do that. They will come out just as an outfall of a properly developed forward looking program that has as its aim the development of at the least parity, and hopefully, control in the space area.

So this is beyond satellites.

Mr. VANCE. In effect they are interrelated, are they not?

General MEDARIS. Of course they are. They are all part of the same problem. You cannot divide the question of weapons systems and satellites and ballistic missiles in this field, you are talking about the same basic techniques, you are talking about the same kinds of powerplants, you are talking about applications that cross right over from one to the other, and divorcement of the two simply impedes both.

Mr. VANCE. And they are divorced at the present time, are they not?

General MEDARIS. Well, they were in the Vanguard program. They are not in our satellite program because we are definitely using weapons hardware to launch a satellite.

Mr. VANCE. And has it the same priority as the Jupiter program, for use as a ballistic missile?

General MEDARIS. Yes, they are at the same priority exactly now.

Mr. VANCE. Do you feel that priority should be changed in any way?

SIGNIFICANT PRIORITIES ARE IN AREA OF RAW MATERIALS

General MEDARIS. No; that is all you can get—the top. I have got all I can get. The fact is that where good management is exerted in these programs, the only place where priority really means anything is in the area of raw materials and mill schedules and things of that kind sometimes, test equipment that you want that is standard equipment, where you have got to get in at the head end of a bunch of buyers, and there it is rather more voluntary cooperation of industry since we have no wartime allocation powers today, but this is where priorities really do count and the only place they do because you can schedule your program so you don't have conflicts.

You can do them both. We don't have to give up something to do something more. We have got enough resources in this field to do them.

Mr. VANCE. General, what do you think is necessary for maximum progress in the missile and satellite field?

General MEDARIS. Well, the first thing that is necessary is that we have a few long-range objectives that we would stay on and those long-range objectives must be out ahead 10, 12, 15 years ahead, things we believe we can do in 15 years.

We must be working toward those constantly without any hold-backs in between these terms of a redecision, a redecision, a redecision.

At the very least we must have a year's program at a time. The program must be in our hands, affirmed as to speed, and money

before the end of the fiscal year. It must be there by the first day of July so we are not waiting around trying to find out what is going to happen to us in the next fiscal year.

Before we run out of one we have got to know what we are going to do for the next one, so that as a preliminary we have to have a year of clearance at a time with the resources and the program approvals that are necessary for us to get on with our work.

WITH SHORT TERM OBJECTIVES WE WILL LOSE THE RACE

But the whole must be based around a longer term program that has an objective way out yonder.

I put it this way: That we cannot and will not ever get into this race as we should so long as all of our objectives are short-term objectives.

So long as our objectives are sometimes in this side and sometimes in that side.

So long as a project team does not know where they go next.

We have got to have no finite end to our objectives. The end of our objectives should be as far as we can see at any given time, and we know there is something beyond that. But right now we need a 10- to 12-year program that has as its ultimate goal the manned domination of space, and if we do not, we are going to be in trouble.

Now, if we do that, the weapons will not be hurt. You put us on out into this field of advanced, what I call advanced weaponry—it is the combination of scientific research and vehicles and implements that we know are militarily useful and will be—and you put us on out in there; you are going to get the Jupiter just as fast, too. You may get it a little faster because the byproducts that come out of a broader base of operation over a longer period give you the fruits of your labors much more easily.

I have compared it before, and am happy to again, compare it with the business of growing an orchard. If you uproot all your trees every fall after you collect the apples and start again the next spring with new ones, you do not get many apples. But if you devote your efforts to cultivating good strong trees, the apples come on out of their own accord and you get a good crop every year and every year you get a better crop.

This is the same way with this kind of a problem. If you are reaching as far out as you can go to get the biggest, strongest tree trunk that you can, that is, going for the limit of your vision, the products of immediate necessity and immediate need will come easier, they will come cheaper, and you will never be impeded in getting on as fast as your brains and your intelligence and your resources will carry you.

That is all.

Mr. VANCE. Thank you, General. I have no further questions.

Senator STENNIS. Senator Saltonstall.

Senator SALTONSTALL. General, you are an extremely interesting and informative witness. I would like to ask you just a few questions that have never been too clear in my mind.

First, could you describe very briefly what was the Project Orbiter that you were talking about that was given you?

General MEDARIS. Project Orbiter was a project for the purpose of putting an instrumented scientific satellite in orbit. It had the same purpose, in fact, as the Vanguard project.

Senator SALTONSTALL. Was the Vanguard project in operation at that time?

General MEDARIS. No. This was before the Vanguard project was begun. They were both under consideration by the Stewart committee at the same time.

Senator SALTONSTALL. If the Project Orbiter had been approved, do you feel that you could have launched an earth-circling satellite by now?

General MEDARIS. Oh, very definitely by now. I should say quite somewhat earlier than now.

Senator SALTONSTALL. Would it have interfered with our ballistic-missile program? Your previous answer to that was in the negative.

General MEDARIS. That is right; it would not have interfered.

Senator SALTONSTALL. Of course, you are familiar with the Geophysical Year?

General MEDARIS. Correct, sir.

Senator SALTONSTALL. If we launch a satellite and have the power to put one up, under what obligations are we under the IGY to disclose the power part?

General MEDARIS. My understanding is that we are under no obligations to disclose the powerplant portion. It is only the instrumented payload portion that becomes a part of the scientific experiments and a part of the IGY. This is my understanding. I do not intend to disclose any of ours, I assure you.

Senator SALTONSTALL. That is one thing that I have never quite understood is why have we had to keep a separate powerplant for the Vanguard project as opposed to the Jupiter project?

General MEDARIS. I do not feel qualified to answer that, Senator. I do not know. The whole business has been somewhat incredible to me, so I do not really know.

Senator SALTONSTALL. Put it the other way around then. Could the Jupiter powerplant have been used? Can the Jupiter powerplant be used successfully to launch a satellite?

General MEDARIS. It can.

Senator SALTONSTALL. In your opinion, we are under no obligation to disclose that powerplant if the satellite is launched?

General MEDARIS. That is my opinion. The real exchange of information in the scientific field is with respect to the information that is gleaned by the satellite in the space environment.

Senator SALTONSTALL. Have you provision now to attempt the launching of a satellite or have you been merely ordered to prepare to launch one; help launch one?

General MEDARIS. I have better than that. I have language—I do not know what it is supported by in the Army, but I have language—from the Army that says in good old-fashioned military terminology, "You will on or about such-and-such a date do so-and so." It just delights my soul.

Senator SALTONSTALL. General, your answer is like some Army orders. It is not entirely intelligible to me. Can you put that into layman's English?

SPECIFIC ORDER HAS BEEN ISSUED TO LAUNCH SATELLITE

General MEDARIS. Yes, sir. What I am trying to say is that the directive I now have is in words of one syllable and leaves nothing to the imagination. It says that I am directed to go ahead and launch a satellite on or about a certain date.

Senator SALTONSTALL. And you intend to do so?

General MEDARIS. I fully intend to do so; yes, sir. I have carried out orders all my life and am going to keep it up.

Senator SALTONSTALL. Now, if you go ahead with that work, will it in any way delay your military ballistic program?

General MEDARIS. None at all.

Senator SALTONSTALL. In fact, it might work the other way around; it might accelerate it, might it not?

General MEDARIS. There is no question but what there is derivative information that crosses right over the lines and is extremely helpful.

We also have participation coming up this late spring in some of the Pacific tests of the Atomic Energy Commission with some of our hardware, and this takes a lot of work and sends some people out there. But the derivative back to us is a full payoff. We know that we get a great deal of benefit in our total program by this sort of operation.

Senator SALTONSTALL. There are several points that you brought out through questioning by Mr. Vance that are not quite clear to me.

First, you said that this nose cone you were now satisfied with so you put it on the shelf. In putting that nose cone on the shelf, I think you added the words "for possible use in a satellite." If you put a satellite up into an orbit, is it part of the experiment to get that satellite down again?

General MEDARIS. No, no; it is not the nose cone that we put on the shelf for possible use as a satellite. It is the propulsion hardware that would launch these test nose cones. This is what is applicable to a satellite. The same test vehicle, the same missile that we use to launch the test nose cone requires only a return to its original state and the addition of a couple of minor components to become a satellite carrier.

Senator SALTONSTALL. That is to give us the proper degree angle and so forth?

General MEDARIS. That is right; to put it in the proper position in space to add the velocity that is necessary for a satellite.

Senator SALTONSTALL. But that does not have to do with the thrust power for a ballistic missile then, except in its very extended stages?

General MEDARIS. It starts off with the same booster to get it off the ground that we use in a ballistic missile, and the upper stages are applicable to missile projects, both small and large. They are taken, some of them are taken from other missile projects actually, and you put them together as we have done in a composite missile of multiple stages, and then it is a question of how are you going to use your guidance system. Do you want to go straight up or do you want to go up and out or do you want to go into a satellite path or do you just want to throw something as far as you can.

Senator SALTONSTALL. And that is the thing you put on the shelf?

General MEDARIS. That is right: the propulsion units for this are what we then put on the shelf because we did not need them any longer for that test program. We had them in various stages of completion. We had a couple of them about finished. We had 4 or 5 more that were coming along.

Senator SALTONSTALL. You said that a bigger engine was not being experimented with or being researched, because there was no definite goal for the use of that engine. That was the reason that it was stopped or that there was no development on it. Now, what about the Atlas? Does that not need a bigger engine than anything that has yet been developed?

General MEDARIS. The Atlas and Titan engines are achieved by putting together more than one unit of the same kind of engine that is being used for the Jupiter.

Senator SALTONSTALL. So that what you say in substance is that we ought to try to develop now a bigger engine than any engine that we now have for simplification or for a further thrust?

General MEDARIS. It is a for further thrust. You can package successfully only so many multiple units. And if you want a bigger total thrust, you have to start out with a bigger engine, or building block, or element in a bigger thrust. Because I have no responsibility to carry this out, I think I can say in open meeting that it is my personal opinion unless this country can command 1 million pounds of thrust by 1961, we will not be in pace.

Mr. WEISL. Will not be in what?

General MEDARIS. In pace, we will not be in the race. We will not be where we ought to be.

Senator SALTONSTALL. If you can say in open hearing—and if you cannot, say so—how many million pounds of thrust are we developing at the present time?

General MEDARIS. I do not think I should go into that in open hearing, Senator. As I say, I have no responsibility for that further achievement. There has been none placed on that level, and therefore I think I am proper in making that other statement.

Senator SALTONSTALL. You have kept to your schedule up to the present time on the Jupiter?

General MEDARIS. We are ahead of our schedule at the present time.

Senator SALTONSTALL. Are you satisfied with the decisions and the methods of making those decisions now?

General MEDARIS. No, sir; I am not.

Senator SALTONSTALL. What further do you want or do you believe you should have that you are not now getting?

General MEDARIS. I feel that in order to do my job, the jobs that are assigned to us, Dr. von Braun and myself, in the best interests of the country and as fast as we can, some place there has to be one man who has the complete power of decision who will make a decision when I go in and talk to him, and who, if he makes a decision, can hand me the resources to carry it out the same day.

Senator SALTONSTALL. That is now being worked out, is it not?

General MEDARIS. I do not know how far they are along that path.

Senator SALTONSTALL. I agree with you; that is beyond your province.

General MEDARIS. That is correct.

Senator SALTONSTALL. But that is the effort that certainly Mr. McElroy and Mr. Holaday have——

General MEDARIS. I have been somewhat disturbed by some of the conversation on the subject because I am not talking about a super-agency and I am not talking about a great staff. I am talking about the power of decision that rests in a man who will ride with his own answers. This is what I am talking about.

Senator SALTONSTALL. That is what we all want. Now, are you satisfied today with the priorities that you now have for your projects?

General MEDARIS. I am satisfied with the priorities, yes, sir.

Senator SALTONSTALL. Are you reasonably satisfied—I add the word “reasonably”—with the progress that you are making?

General MEDARIS. I am definitely satisfied with the progress that we are making.

Senator SALTONSTALL. And are you satisfied with the amount of funds that you now have?

General MEDARIS. I am not.

Senator SALTONSTALL. And you never will be?

FUNDING ON SHORT TERM BASIS UNSATISFACTORY

General MEDARIS. No, sir, that is not true. That is not true, Senator. I have consistently and at all times made the best possible estimates of my fund requirements; and if I am given what I feel in honest, good business and technical judgment is needed, I am satisfied. But I need it for more than 2 months at a time.

Senator SALTONSTALL. What you do want is to be able to tell a year ahead, at least a year ahead, how much funds you are going to have for that year?

General MEDARIS. That is correct, sir.

Senator SALTONSTALL. I am heartily in sympathy with that. And what you would like to have would be, we will say, like the authority for building an aircraft carrier, that is the authority to obligate funds for 1, 2, or 3 years in advance if it is possible to do that?

General MEDARIS. If possible, that is what I would like to have. I would like to see a project in a package that I could see down the road and could, in effect, tell anybody who was interested: “Come back and look in a year from now and if you are not satisfied with my job, take me out and put somebody else in, but do not look at me in the meantime. Let me alone. Let me go to work.”

Senator SALTONSTALL. Just one final question. You stated that you believed that we should have a goal say of 15 years in advance, and work toward that goal and take steps along toward that goal.

I listened with a great deal of interest to Dr. Teller the other day. The problem that we have there is to determine whether we are willing to take the risk, is it not, of building up parts of a project which may become discarded because something better will be found or the project may be changed in the long-distant future.

In other words, there is a risk, is there not, from a scientific viewpoint?

General MEDARIS. There is a certain amount of risk of course. We find out nothing new in this world without taking some risks, because if we knew always exactly what we were doing, we would not need development programs.

We would only need manufacturing programs. We would not need research because we would always know, and there is always a risk when you go out to try to do something that you today don't know exactly how to do.

The risks, however, if properly spread and if the program objectives are correct, you can evaluate these risks very carefully, and you know that they are not sufficient to overcome the advantage of the total program.

But you have to take a certain amount of risk.

This is true. You are not going any place if you do not.

Senator SALTONSTALL. In other words, you begin with basic research.

General MEDARIS. We begin with basic research but I feel there has been a little too much talk about basic research and too little talk about the great field that is between basic research and a finished project.

Basic research, as we understand it technically, means the investigation of the physical fields to derive new principles, to answer questions that are not now capable of a final answer.

Now you can get a lot of basic research for not too many dollars. If you double the whole basic research, in the true sense, basic research program of the country, you are not talking about a whole lot of money in the terms we talk about now. But now right behind that comes the question of translating this principle into a workable experimental piece of hardware that will prove out the principle on a scale that is usable.

I might put it this way: The principle of the internal-combustion engine was discovered in a laboratory, shall we say, but then somebody had to build an automobile engine big enough to run something, and until that engine was built, he did not know whether he could have an automobile or not. The same thing is true in all of these, and that intermediate field is the costly one, and that is the field where the real increase in effort is required.

Again I come back to the question of an engine that we don't now know exactly what we are going to do with it.

We know about what we ought to do with it when it comes along, but beyond the needs of an immediate hardware project, to develop an engine, this is money, whereas basic research is of a different order of magnitude.

Now basic research puts new knowledge into the system. Without adequate basic research, we have no objectives, and we do have too high a risk in the individual projects if we have not had sufficient basic research, because we still have too many questions when we go for a piece of hardware.

Senator SALTONSTALL. Fundamentally what you are saying is that we should look forward on a longer term basis than we have up to the present time, and to work on all of our various types of basic science, our basic research, our industrial research, our development on a longer term basis. If we have that, then we will get ahead in the control of space, you say.

THE THREE STAGES FROM RESEARCH TO FINAL PRODUCT

General MEDARIS. That is correct, sir, and I might summarize it in three stages in this way: the basic research we should be doing today should be adequate to solve the questions that will lead to hardware 15 years from now.

The applied research, the intermediate area, should be today devoted to those tools that we know we will use 6 to 10 years from now, and then your actual development of an end product is devoted to that thing that you are going to need 2 or 3 years from now.

This is the proper time schedule, but unless you are looking all the way down that 15 years you cannot go on this kind of schedule.

Senator SALTONSTALL. Thank you, sir.

Senator STENNIS. Senator Flanders.

Senator FLANDERS. General, I am interested in your use of the word "mobility" in application to the Jupiter.

General MEDARIS. Correct.

Senator FLANDERS. From my number of hours spent out on the coast looking at the operations there, and I might say we are coming down to Redstone, too—

General MEDARIS. Delighted.

Senator FLANDERS. Because I find that several days of hearings will be the equivalent of a few hours of observation and conversation.

General MEDARIS. Yes, sir.

Senator FLANDERS. So I am looking forward with tremendous interest to going down to Huntsville.

General MEDARIS. We will be delighted to have you, sir.

Senator FLANDERS. Now the word "mobile," was not used in any conversations we had with reference to the Thor.

The word used was "movable."

Do you feel that there is greater mobility through Jupiter and from the standpoint of the ground installations than there is from Thor?

General MEDARIS. The Jupiter was designed originally, Senator, to be a ground mobile weapon. The original engineering design was according to Army concepts of employment, which is mobility.

JUPITER IS EXTREMELY MOBILE SAYS GENERAL MEDARIS

Therefore it is capable of being put on mobile ground equipment. That was the original objective of the program.

Now I think it is rather obvious that anything that can be mobile can also be movable and it can also be fixed to a piece of concrete if you want to, but if you do not start at that end, it is a little hard to get that.

Senator FLANDERS. The distinction was made between "mobile" and "movable." I suppose—would you feel that a distinction could be made between those words, those two words, in the sense of keeping up with an Army, a moving Army so far as the launching bases and equipment are concerned?

General MEDARIS. If we are to keep up with the moving Army so far as launching bases and equipment are concerned, we must be mobile.

Senator FLANDERS. Yes.

General MEDARIS. Now the mobility, the potential mobility of the Jupiter system and the actual mobility of the Redstone system are

much to the amazement of many greater than they were of an 8-inch gun battery during World War II.

Senator FLANDERS. Mr. Chairman, that fits in with the suggestion I made yesterday that the Army should be assigned all missiles which are in some real sense of the word mobile rather than specifying range or other physical characteristics.

I find, General, that there are certain—there is a certain vocabulary which goes with the missile business. I get these words from time to time from your testimony, I get them out in Los Angeles. One you used, and you defined it, yet I have not quite got the word yet, that is the word "configuration."

Is that a missile word for "design," a design?

General MEDARIS. We use the word "configuration," Senator, to cover the entire subject of overall design, outward appearances, number of stages, design of each stage from its outer appearance, and the basic principles, the basic methods by which the missile is to be controlled.

So I use configuration in the sense slightly different from final complete design, because there may be internal refinements; there will be.

If there were not any need for those we would not have a development program, we would have gone right into production 2 years ago, but when we fly a configuration we have now aboard the missile everything that is essential to the operation of the missile, and in the same form of control that it will be finally used.

Senator FLANDERS. I think I am getting that now.

When an amateur, like those of us over here, is thinking about mobility, the question arises in our minds as to whether there is not greater mobility to the missile with the solid propellant than there is to the liquid.

General MEDARIS. This, Senator, can be the subject of considerable lengthy discussion but I will try to brief my own approach to this problem very quickly for you.

The difference between the solid propellents and liquid propellents in some sense is like the difference that has existed for years between gasoline engines and diesel engines. Both are good. For any design purpose the engineer must select that which, considering all conditions, is best for his purpose.

There were some frustrating problems years ago to adapt diesel engines to aircraft, to cut down the fire hazard but because of the characteristics of the diesel engine it was found it did not work very well and it was discarded as an approach to aircraft power.

So that in the same sense you can look at solid and liquid propellents; each has advantages, each has disadvantages. Neither one is a final answer to all your problems, and for any given missile at any given point in the time scale a decision must be made by the designer as to which has the characteristics that fit the requirements at that point.

Now when you talk about the mobility of a solid propellant, there is one thing that is somewhat overlooked and that is you have to move more weight in one package in a solid propellant than in a liquid propellant missile. Because we can move a liquid propellant missile empty and fill the tanks wherever we have to go.

Whereas in a solid propellant missile you have to move the whole gross weight at one time so you are not too sure about this mobility when you get beyond a certain weight.

Senator FLANDERS. Of course I am thinking about the ground equipment required.

General MEDARIS. Well, the ground equipment for the same size of missile must be heavier for a solid missile than it is for a liquid missile.

Senator FLANDERS. I don't think it is necessary to go into that in detail now, but what you say interests me because one's first thought would be that the solid propellant would require a very much simpler and less expensive ground equipment than the liquid.

General MEDARIS. This is not totally true. There are differences, both ways, but let me show some of the problems in this form, if I may, Senator.

As long as you are dealing with small missiles that are within the proper load when they are fully loaded with solid propellents (within the proper load of normal road transport) there is no question about the advantage of solid propellents with a small missile.

When you get up into the bigger ones the question is do you want mobility or don't you, because if you want mobility, at a certain point you get too big a chunk of powder to carry at one time and now you are in trouble. You either must divide it and assemble it on the spot which decreases reliability, or you must get some tremendous type of carrying mechanism that will carry the whole gross weight at one time.

Senator FLANDERS. Yes.

NEITHER PROPELLENT SATISFIES ALL REQUIREMENTS

General MEDARIS. So you get a changeover point.

It also applies to the Navy's decision, because of the way they are going to use a missile. They load it off dockside with great big cranes, it goes into position in a ship and it stays there, so the question of having to handle it in bigger weights is not important, and there are advantages that offset that for the Navy. But this comes back to my conclusion that neither one is the final answer to anything.

We are using them in combination in these multistage missiles. We have liquids for first stages and solids for upper stages.

In every case the choice must be a careful choice based on the known characteristics and what are you trying to do.

This is the whole business.

Senator FLANDERS. My only point in bringing this up at this meeting is in connection with this point of mobility as distinguished from what is movable, and I think you have answered all I need to know at this point.

General MEDARIS. Thank you, Senator.

Senator FLANDERS. Mr. Chairman, that is as far as I am prepared to go on the questions I have prepared.

Senator JOHNSON. Senator Stennis?

Senator STENNIS. General, my questions will be limited in number, but I want to say that you have summed up here in a few words, better than anyone else, I believe, what is the need for a top, overall Director or Manager. The way you expressed it was that you needed someone who can make a decision and then hand you the material. I assume that includes the money—

General MEDARIS. That is right.

Senator STENNIS (continuing). To carry it out.

General MEDARIS. That is right, sir.

Senator STENNIS. I commend you for your statement of that. I have run across statements of others to the effect that, after all, the President of the United States is the Director of the missile program, and that of course he is going to take care of it.

I am afraid we are misled by those words. I do not expect your comment on that.

I know if the President had nothing else to do, he would certainly be an excellent Missile Program Director. But he has literally thousands of other major things to do. He does not have a chance to supply such a role as that.

And I believe, with you, that nothing short of someone charged with that responsibility, primarily and solely with that responsibility to make plans and make decisions, and send you gentlemen on the firing line, so to speak, the goods to carry it out.

I want to direct your attention now to your military construction program. I am familiar in part with that.

You had an authorization last, for the current fiscal year, of \$25 million, a blanket-type authorization. You have mentioned that you had \$17 million of that which had been made available to you; is that correct?

General MEDARIS. Well——

Senator STENNIS. The appropriation followed up that authorization, I recall.

APPROVAL GRANTED FOR \$17 MILLION OF \$25 MILLION APPROPRIATED

General MEDARIS. That is correct, sir, and the appropriation, the congressional action, was completed. This was for fiscal year 1957. But, of course, it is no-year funds, so it is still available.

Senator STENNIS. Yes.

General MEDARIS. This appropriation was in the amount of \$25 million in support of the Jupiter program. That is correct. To date, we have had approval for specific projects only to the extent of \$17 million.

Senator STENNIS. All right.

That means the other \$8 million, then, appropriated expressly for this program, has been held back. Have you requested more than the \$17 million?

General MEDARIS. Yes, sir.

Senator STENNIS. And you felt, of course, the need for it or you would not request it, you would not have requested it.

General MEDARIS. Certainly not.

Senator STENNIS. Do you still need it?

General MEDARIS. The projects are still in, requesting approval; yes, sir.

Senator STENNIS. Is it going beyond classified material to ask what projects have been denied?

General MEDARIS. These are——

Senator STENNIS. I will not press that question. That is your judgment, sir.

General MEDARIS. There are four projects for the augmentation of our necessary test and laboratory facilities at ABMA; yes, sir.

Senator STENNIS. And those four projects are included in your \$8 million?

General MEDARIS. That is correct, sir.

Senator STENNIS. Not only has this been authorized, but funds have been appropriated?

General MEDARIS. That is right, sir.

Senator STENNIS. Where is the holdback on that? Do you know who is holding that back? Is it the Director of the Budget, or the director of the budget for the Department of Defense, or just where is the holdback?

General MEDARIS. I cannot say, sir. The internal operations are in the Ballistic Missile Committee of the Department of Defense. I am not privy to what they do inside.

I know it is in there, and I know it does not come out. That is all I know.

Senator STENNIS. That is another illustration for the need of the individual you described, who could make a decision and then hand you the material to carry it out.

General MEDARIS. That is correct, sir.

Senator STENNIS. You do not really now know where to turn to pin down the point about this \$8 million; do you?

General MEDARIS. No, sir. I beat on the head of the man I know had it last, but— [Laughter.]

Senator STENNIS. I think that well illustrates what we have been driving at here.

May I present a letter from Dr. J. A. Van Allen, who is the head of the department of physics at the University of Iowa, and direct your attention to a statement made by Dr. Van Allen. This letter has been referred to before and has been included in the record. I will read a short paragraph and request your opinion of it.

In the satellite field, it would have been technically feasible for the United States to place satellites in orbit at least as early as October 1956, using the Army's Jupiter-C. But the Army's proposal to do this was voted down within the Defense Department in the summer of 1955 in favor of having the Navy undertake the development of a complex new vehicle for the purpose. This decision, which has been actively contested by some of us throughout the past 2 or 3 years, was defended in terms of not interfering with direct military developments.

Here is the point I want your opinion on:

However—

he says—

the true overall effect has been exactly the reverse, since a fresh set of difficult missile developments was imposed on commercial contractors—Glenn L. Martin Co., Aerojet Engineering, Grand Central Rocket, and so forth, who were already deeply involved in the development of purely military vehicles. The proposed Jupiter-C system was to have been examined—

and so forth.

Do you agree with his statement here—and this is not trying to find blame, but seeking guidance for the future—that the very reverse turned out to be true, that there was an actual interference with the military missiles because it imposed new and additional burdens on these manufacturers? Was he correct in that, or not?

General MEDARIS. As a matter of principle, I believe he was correct. The particular companies involved are not a part of my project, and therefore I am not able to define the exact interferences.

Senator STENNIS. Yes.

General MEDARIS. But I believe sincerely that he is right.

Senator STENNIS. I beg pardon?

General MEDARIS. I believe sincerely he is right in everything he says.

Senator STENNIS. He is correct on the principle in that paragraph?

General MEDARIS. Yes, sir.

Senator STENNIS. I thank you very much, Mr. Chairman. I yield the rest of my time.

Senator JOHNSON. Senator Symington?

Senator SYMINGTON. Thank you, Mr. Chairman.

General Medaris, it is a pleasure to see you. I think we have known each other before either one of us knew anything about missiles.

General MEDARIS. Yes, sir.

Senator SYMINGTON. I am sorry I was not here to listen to the very able questioning of you, not only by the chairman, but also by the brilliant young assistant chief counsel, for whom we are having increasing respect as he prepares these hearings under the direction of our also very able chief counsel.

I remember your previous appearance before the Armed Services Committee of the Senate, and also before its subcommittees.

Let me congratulate you for the job you have done down at Huntsville, for the sincerity and the effort you put in. It makes me proud to be a citizen of a country that has people like you.

General MEDARIS. Thank you, sir.

REAFFIRMS STATEMENTS AS TO PROGRESS IN 1945-50 PERIOD

Senator SYMINGTON. At the hearing last year, you said, and I quote:

During this period 1945 to 1950, Dr. von Braun and his group were able to develop those basic requirements for sound development of heavy, medium, and long-range missiles that are essential to the progress being made today.

You then went on to say at one point that:

In 1950, the Redstone project was started as the first development project of this type to develop a weapon.

And further along in the testimony, it was pointed out that the Redstone was the experience backup for the development of the Jupiter.

What are your thoughts today, about those statements made over a year ago? Do you still feel that way about it?

General MEDARIS. Yes, sir.

Senator SYMINGTON. The first Redstone was fired, I believe, in 1953; right?

General MEDARIS. You will permit me to verify the date here, sir.

On the 20th of August, 1953, Senator.

Senator SYMINGTON. I know you must have answered questions as to why we have not proceeded further, but we have all known for a long time about the growth of Russian strength.

I was interested in the questions asked you by Senator Stennis. Why do they not give you enough money to do this job right? What is the reason for holding up the funds you want?

General MEDARIS. I do not know, Senator. I frankly do not know.

So far, eventually I have gotten the money to get on with my projects so far as Jupiter is concerned, generally at the stated figures that I required, but I have gotten it in fractional pieces and I have been late getting it, and that sort of thing.

But the reasons behind this, I am not qualified to answer, Senator.

Senator SYMINGTON. When did they take the wraps off of various controls, and let you go ahead with the Jupiter project on a highest priority basis?

General MEDARIS. Well, the project, the initial approval that put us into the Jupiter business on the highest priority basis was, I believe, in November; the directive was dated around the 8th of October, was it not, 1955—November 8, 1955.

That was the go-ahead directive on the Jupiter and placed it on the highest priority.

Senator SYMINGTON. How can you be working on highest priority if you do not have enough funds to pursue it?

General MEDARIS. Initially, on the first go-round, we got the funds for the first 6 months of operation, we got the funds we asked for and got them immediately.

The stops and starts did not materialize until in the early fall of 1956.

Senator SYMINGTON. The early fall of 1956?

General MEDARIS. That is right, sir.

Senator SYMINGTON. What were those stops? What happened at that time?

General MEDARIS. There was the point where the uncertainty was injected into the picture as to whether the Jupiter was going to go through to a weapons system, or whether day by day it might be canceled in favor of the Thor project.

And from that date on until just very recently, we sort of were in the position of a patient that has been given a death sentence by the doctor, but we kind of refused to die.

Senator SYMINGTON. And now your sentence has been commuted and you see some green lights ahead, is that right?

General MEDARIS. That is correct, Senator.

Senator SYMINGTON. As a matter of fact, I would say more than commuted. You have been pardoned.

General MEDARIS. Yes, sir, I hope so.

Senator SYMINGTON. Now, we are going to make both missiles, is that right?

General MEDARIS. That is correct, Senator.

Senator SYMINGTON. Do you know yet whether you have enough funds to proceed on that basis?

General MEDARIS. At the moment I do not. I understand that the budget as we have submitted it has been approved, and that we will in, shall we say, due course get the money, but at the moment I do not.

Senator SYMINGTON. You are going to have to tool this missile, are you not?

General MEDARIS. That action was started some little time back, and, of course, in the actual course of developing the missile, we have fully tooled our own line.

Senator SYMINGTON. I understand.

General MEDARIS. And we started, and since that line was developed in conjunction with our prime contractor for production, the Chrysler Corp., with their tool engineers, the duplicate tooling of that line was started on its way to Chrysler in September.

Senator SYMINGTON. Are you satisfied with the Jupiter missile? Do you think it is a good missile?

General MEDARIS. I think it is not only a good missile. I think it is a rather incredible missile, and this is an objective statement. I want to put that on the record, although nobody will believe it, but I will put it on the record anyway.

Senator SYMINGTON. If the Thor were a better missile, would you be glad to use the Thor?

General MEDARIS. I think I have a reputation for having canceled out unproductive projects without restraint when I felt that they were not in the best interests of the country, and I would honestly, if I thought the Thor had the better chance of coming out to be a fine operational weapon, I would be tickled to death to use it and stop the Jupiter. I do not believe so, though.

Senator SYMINGTON. You believe the Jupiter is better?

General MEDARIS. I believe the Jupiter is the better weapon.

Senator SYMINGTON. In any case, I think we both believe it is a good idea to make them both and prove it out?

General MEDARIS. I think under the present circumstances, if you want to get the earliest possible operational capability, that it is a worthwhile effort in that direction. You have a higher assurance. Of course, there is another thing that enters in, too; Senator, and that is psychology enters into these things. Although we hold ourselves to have rigid standards—and I would hope that this would not apply as much to us as it might to others because we can stand out against this sort of thing—nevertheless I think we have to recognize that so long as there are two projects in competition, the sense of urgency on the part of each is a little bit higher, and probably we get an earlier missile by reason of the fact that neither one of them will let things stand in their way that ordinarily might be an adequate excuse for waiting a little bit.

Senator SYMINGTON. And that is the way it is working out now?

General MEDARIS. That is the way it is now, yes, sir.

BALLISTIC MISSILES SHOULD BE IN THE HANDS OF THE GROUND FORCES

Senator SYMINGTON. How about the mission angle of it? Who do you think should have the mission on the IRBM?

General MEDARIS. Of course, I am committed to support as a project director of any force that is assigned the use of our missiles, and I do not recant that commitment and I will give anybody the best support that I can.

As a professional, however, I have to agree with such people as Air Chief Marshal Joubert who made a study of this subject and came up with the conclusion that missiles as an extension of artillery should be in the hands of the ground forces, and with the conclusions of the Russians who have committed their missiles entirely to their army force, and I have to agree that in my professional opinion that is where they belong.

Senator SYMINGTON. But if you had adequate unification of the services, proper unification of the services where you are working all

together instead of arguing about these missions, then the question of who was going to do it and take it over in his own backyard would be relatively secondary, would it not?

General MEDARIS. This is true. However, I do not think it quite gets to the heart of the matter, if I may apologize for saying it that way. The heart of the matter, to my mind, is that the system of assigning roles and missions to the Armed Forces will never give us anything but argument and discussion.

I cite you the possibility of the case of a dispute between two craft unions over who was going to be allowed to use a pair of pliers, and I do not think we could come up with any sound decision as to the proper field for both the carpenter and electrician if their role or mission was decided on what tools they were permitted to use. And that is the problem we are into with this roles and missions business.

The basic business of assigning roles and missions on the basis of a single tool will never resolve the question of argument and rivalry. It is an inadequate approach.

Senator SYMINGTON. General, I do not think I have ever heard it put better. I was distressed when the Congress took upon itself to legislate roles and missions, and I have been distressed that little or nothing has been done to iron this problem out in the Pentagon in recent years. If the roles and missions are legislated, it seems to me incredible the Department would make an arbitrary statement and say you cannot have a missile in the Army beyond 200 miles.

Do you agree with that?

General MEDARIS. I think that is a very unwise approach to answer.

Senator SYMINGTON. In other words, you automatically block normal engineering and scientific development if you approach it that way?

General MEDARIS. This is true.

Senator SYMINGTON. But if people like General Gavin and General Lemay were working together, without these arbitrary fixed divisions, you would do the best job in defense of the country, at the least cost. Is that correct?

General MEDARIS. I think this is true, and I think we can go a step further: That there ought to be a way to define missions in terms of what should be accomplished rather than what should be used to accomplish it with, and then the forces should be allowed to have any tool that they deem necessary to the accomplishment of that objective. And if the roles and missions were defined in terms of objectives to be achieved rather than the means to be used, I think we would have an end to this business of fussing between the services entirely.

Senator SYMINGTON. Mr. Chairman, the witness' testimony is based on his obvious intelligence; and also on his experience and understanding of the problem. I will not pursue it this morning, but I do hope, Mr. Chairman, there will eventually come a time when we will face up to this situation, one which is costing the American taxpayers unnecessarily billions of dollars a year.

I thank the general. I have no further questions.

Senator JOHNSON. Thank you, Senator Symington.

Any further questions of any member of the committee?

General Medaris, I have a few questions. I was out of the room when it came my time. I would like to ask you to state as succinctly

as possible what you recommend doing to accelerate the operational status of the intermediate missile?

General MEDARIS. To accelerate the operational status of the intermediate?

Senator JOHNSON. The intermediate range missile?

General MEDARIS. I believe all that is necessary to get the maximum acceleration of that is a clearly defined objective for the project in terms of quantities, in terms of force, manning, and in terms of the concept, to be used, the provision of funds for at least 1 year ahead, and then let me alone.

Senator JOHNSON. You don't have that now.

General MEDARIS. No, sir. I have part of it. I have parts of each but I don't have all of any of those.

Senator JOHNSON. We will see what we can do to give you a lift there, General.

The one impression that I have gained from hours of hearings thus far, and I don't want to preclude arriving at some other conclusions, but the one that I am positive about now is this: We have reached a point in the history of our country when it is time to send for the sundowners.

I don't know whether I ought to take the time of the committee to elaborate on that or not, but any of the old Navy men around here will be familiar with the term.

Now General, I want to ask you if this is a fair way to summarize your testimony. You requested priorities time and time again and did not get them, is that right?

General MEDARIS. Oh, no, sir, the priorities we have had.

Senator JOHNSON. Without limitation.

General MEDARIS. Sir?

Senator JOHNSON. You requested priorities without limitation; isn't that your testimony?

General MEDARIS. No, sir. Resources is the question.

The request has been for resources, and they have been given limitations, and in partial form. The priorities as the term is understood, we have continuously had the highest priority which we could extend to our demands on other people, but your ability to use a priority is limited by your resources.

REQUESTS ONLY PARTIALLY FULFILLED

Senator JOHNSON. All right, so you got the priority but it was not implemented.

General MEDARIS. This is correct, sir.

Senator JOHNSON. You protested limitations on overtime, allocation of manpower, facilities, research funds and nothing was done about it.

General MEDARIS. This is correct, sir. I won't say nothing was done about it because in each case something was done about it.

I got part of what I asked for in every case.

Senator JOHNSON. But not enough was done about it?

General MEDARIS. But not what I had asked for, sir, which I deemed to be necessary.

Senator JOHNSON. You told the Defense Department that a large-thrust engine running up to a million pounds, unless we had that we would likely lose the race with Russia by 1961, and they did nothing about it and have done nothing about it.

General MEDARIS. I could not put it in those terms. I have made that statement. I have made it both officially and here to the committee. I have not been in a position to make any such recommendation direct to the Department of Defense. We did, however, recommend and request the privilege of developing a higher thrust engine than that now available to us, and that request was turned down.

Senator JOHNSON. But you do recommend that to the committee and that does represent your view?

General MEDARIS. That does represent my view; yes, sir.

Senator JOHNSON. Funds have already been appropriated but allocation to you has been held up; is that correct?

General MEDARIS. That is correct, sir.

Senator JOHNSON. You had difficulty in getting decisions in the Defense Department?

General MEDARIS. That is right, sir.

Senator JOHNSON. We have had some recommendations. Were you present in the committee yesterday?

General MEDARIS. No, sir; but I am familiar with the proceedings, Mr. Chairman.

Senator JOHNSON. Did you hear the recommendations that were made by the scientists and manufacturers and various groups that we presented to each witness?

General MEDARIS. Yes, sir; I have heard those.

Senator JOHNSON. Are you in general agreement with those recommendations?

General MEDARIS. I cannot say that I am entirely, sir.

Senator JOHNSON. Would you specify in what regard you disagree with them?

General MEDARIS. The basic recommendation that there be an independent commission or independent agency to conduct these programs I do not agree with, sir.

Senator JOHNSON. What is your view about that?

General MEDARIS. My view is that—

Senator JOHNSON. Strike out the words "civilian commission"?

General MEDARIS. Strike out the word "commission."

We already have too many committees and commissions. I do believe that one individual must be charged with the responsibility. I believe that we may impede the program if that individual is charged with setting up an agency or great staff or top organization of his own.

I believe he must be an informed individual of greater courage and empowered to make his judgments and back them with the resources necessary to carry them out.

I believe that that individual can properly and should properly be within the Department of Defense, since otherwise you will have great collision of resources throughout the whole system by his being, by there being unfamiliarity with the current state of other things which affect the availability of resources and manpower in the different areas required to carry these things out, whereas if he is working as a direct subordinate of the Secretary of Defense, he will normally and naturally be fully informed all the time with respect to the current status of other demands, and will therefore place his charge, place his requirements, on people who are most able to carry them out, and without conflict with other problems.

Senator JOHNSON. In what other respects do you disagree?

General MEDARIS. I have to put a question mark on the second one with respect to a permanent, adequate, and competent staff in the Department of Defense to provide for better basic research.

I think there has been an adequate staff, maybe more than enough.

Again I come back to the fact that by tradition, by practice, by experience, the power of decision can best be handled by an individual who is held responsible for his results, and when we talk about staffs and commissions, I always get nervous because I am overcommitted right now, so I think more in terms of the successful accomplishment of these things by charging a man, an individual, with a responsibility.

He has the entire resources of the country to call upon for advice and assistance.

Senator JOHNSON. You would emphasize the competent?

General MEDARIS. I would emphasize the competent and not talk about a staff. I would talk about a man. This is the difference, about an individual.

Senator JOHNSON. Any other suggestions?

EARLY AND FIRM DECISIONS AND LONG-TERM PROJECT BASIS NEEDED

General MEDARIS. The other, I am in general agreement with. The early and firm decisions is the one that I would put as the headliner of the whole business, and second, the 3- to 5-year basis of being able to look ahead on your projects.

The question of leeway to contractors in making technical decisions depends on the nature of the beast that you are developing or the project that is being carried out.

I think where we put a thing out on a weapons-system basis to a contractor, obviously he must have great latitude in making technical decisions.

Where, however, that contractor is subordinate to an engineer group that is responsible for the overall system, then he must be highly limited in making technical decisions, because otherwise you have an incompatible system very quickly.

So this depends on the relationship in the particular project, what you have set up.

Senator JOHNSON. What do you think about General Doolittle's and General Gavin's general staff proposal?

General MEDARIS. Well, this is a thorny problem.

Senator JOHNSON. It is the only kind we ever get up here.

General MEDARIS. I know that, sir, and I feel deeply for the committee in their approach to these things.

Senator JOHNSON. Thank you, General.

Tell us what you think about this suggestion.

General MEDARIS. I think that probably the nearest approach to a sound solution to the whole is that that was advised yesterday by General Gavin.

Senator JOHNSON. Are you in general agreement with General Gavin's testimony of yesterday?

General MEDARIS. I am, very definitely.

Senator JOHNSON. Do you desire to be associated with it?

General MEDARIS. I love it. I am associated with him and I enjoy it thoroughly.

Senator JOHNSON. You love the testimony or love him?

General MEDARIS. I said I love the association, sir.

I am delighted to be associated with General Gavin in any project.

Senator JOHNSON. We are very honored to have with us this morning one of the wise men of our time and one of the great men of the Senate, Senator Hayden.

Senator Hayden, I wonder if you care to ask any questions of the witness.

Senator HAYDEN. I just came in to observe, thank you.

Senator JOHNSON. That proves the first part of my statement about how wise Senator Hayden is.

General Medaris, you have been a very interesting and very informative and helpful witness. You appear to have great confidence in your mission and the men who are working for you.

We want to thank you for coming here and making these constructive suggestions to the committee.

We hope that your confidence will be justified in terms of results and achievements, because there is no question in my mind about this being a critical hour in our Nation's history, and if there is anything America needs, it is achievement right now.

Senator Saltonstall?

Senator SALTONSTALL. Thank you, Mr. Chairman.

General Medaris, I have listened with a great deal of interest to you now for 2 hours.

Boiled down what you need most in your opinion to go ahead with your projects satisfactorily is the authority to make a decision in the Department of Defense, which will give you clearance to move forward.

That is the main thing.

The second is that you would want funds on a longer term basis, and over the long range if the law should be changed, then you would believe that we could advisedly go into a different system of planning in the top echelons of the Joint Chiefs of Staff.

Does that sum it up?

General MEDARIS. I think so; yes, sir.

Senator SALTONSTALL. Thank you very much.

Senator JOHNSON. Thank you very much, General.

You are excused.

General MEDARIS. Thank you, sir.

Senator JOHNSON. For the information of the committee I should like to say it is our plan to recess in the neighborhood of 1 o'clock and come back about 2:30 and run until late this evening, but we don't plan to have a late evening session.

It may run to 6:30, 7, or 7:30 if that is necessary.

Of course we will have hearings Monday and at least through Tuesday of next week.

Our next witness is Dr. Wernher von Braun, the Director of Development Operations Division of the Army Ballistic Missile Agency.

The committee is particularly fortunate in being able to receive testimony from a man who has literally devoted his life to the scientific field of rockets, missiles, and space vehicles.

Dr. von Braun, I hope you will come forward and take your seat at the committee table.

At the age of 18, Dr. von Braun joined the German Society for Space Travel, and since that time has worked in this field.

In 1937 he became the technical director of the Peenemuende Rocket Center in Germany, where the V-1 and V-2 rockets used in World War II were developed.

He came to the United States in 1945 with a group of German scientists who came to this country to work on rocket and missile development.

Since 1950 he has worked at the Army Redstone Arsenal at Huntsville, Ala., and has been with the Army Ballistic Missile Agency since February 1956.

Dr. von Braun became an American citizen in April 1955.

In recent months he has captivated the public imagination of this country with his public statements about the importance of outer space, and his conviction that man can and will conquer it.

We are delighted to welcome you, Dr. von Braun, to this historic committee room and to this committee that is charged with the responsibility of maintaining a constant surveillance over our armed services and the state of our Nation's preparation.

As is customary with all witnesses who have appeared before this committee, we will ask you to stand and raise your right hand and take the oath.

Dr. von Braun, do you swear that the testimony you give this committee will be the truth, the whole truth, and nothing but the truth?

Dr. VON BRAUN. I do.

Senator JOHNSON. Mr. Weisl will proceed to examine the witness. But first we will insert Dr. von Braun's biography at this point in the record.

BIOGRAPHY OF DR. WERNHER VON BRAUN

Dr. Wernher von Braun is Director, Development Operations Division, Army Ballistic Missile Agency, Huntsville, Ala.

He was born March 23, 1912, in Wirsitz, Germany. He received his doctor degree in physics from the University of Berlin in 1934.

In 1930 he joined a group of inventors connected with the German Society for Space Travel. In 1932 he became connected with the German Ordnance Department. He was chief of a small, liquid-fueled rocket development station near Berlin from 1932 to 1937. Here the A-1, A-2, and A-3 rockets, forerunners of the V-2, were developed.

In 1937 he became technical director of the Peenemuende Rocket Center. He remained at Peenemuende until the closing months of World War II when he and his colleagues voluntarily decided to turn over their research information and valuable technical data to the West.

He came to the United States under contract with the United States Army Ordnance Corps in September 1945. He first worked on high altitude firings of captured V-2 rockets at the White Sands, N. Mex. Proving Ground. Later he became project director for a guided missile development unit at Fort Bliss, Tex. which employed many of his Peenemuende colleagues.

Since April 1950 he has been in Huntsville. He was in charge of guided missile development at Redstone Arsenal until he transferred to the newly activated Army Ballistic Missile Agency in February 1956.

He is affiliated with many scientific societies and has published numerous papers and books, many of them on space travel, and has assisted in the production of motion pictures on the same subject.

His present work is with the weaponization of the Redstone ballistic missile and the development of the Jupiter intermediate range ballistic missile. As such he directs the work of nine laboratories, a research projects office and a technical liaison office.

Dr. von Braun and many other former German scientists and their families became American citizens April 14, 1955, in Huntsville.

TESTIMONY OF DR. WERNHER VON BRAUN, DIRECTOR, DEVELOPMENT OPERATIONS DIVISION, ARMY BALLISTIC MISSILE AGENCY, HUNTSVILLE, ALA.

Mr. WEISL. Dr. von Braun, you are associated in the German use of the V-2.

Will you tell the committee briefly just what your association with the V-2 was?

Dr. VON BRAUN. Yes, sir.

The V-2 was the outgrowth of liquid fuel rocket developments that had been going on in Germany since 1930. In 1930, still as a student, I became associated with the German Society for Space Travel. We built some rather primitive liquid-fuel rockets under the auspices of this society.

Mr. WEISL. How old were you at that time, Doctor?

Dr. VON BRAUN. 18.

Mr. WEISL. Proceed.

Dr. VON BRAUN. In 1932, about 2 years later, the German Army became interested in our work, but was ready to support us only with the stipulation that we would move behind the fence of an army facility. This is how I became affiliated with the German Army.

Under the auspices of the army we first built two smaller liquid-fuel rockets, and by 1936 this project had progressed so well that the German Army, jointly with the German Air Force, decided to establish a rocket center on the Baltic Sea, which became the Rocket Center of Peenemuende, and it was there that the V-2 rocket was developed.

The actual development work on the V-2 began in early 1940.

The first flight tests were made in the spring of 1942, but were unsuccessful.

In October 1942, the first successful flight of the V-2 was made.

In September 1944, the V-2 went into military operation.

Mr. WEISL. Dr. von Braun, will you please tell the committee what lessons were learned from the operation of the V-2? I am now speaking of mobility, guidance, and such other lessons as were learned that are now applicable to the manufacture and use of missiles.

Dr. VON BRAUN. Sir, when it was decided to put the V-2 into military operation, it was still full of bugs, as we used to say in the rocket field. It was a brandnew weapon, a brandnew technology. Particularly, the engineers and scientists at Peenemuende, for whom I was speaking at the time as the technical director, we were of the opinion that a fixed base concept was the only feasible solution at that time to put this weapon quickly into operation. So we insisted on concrete pens under which the missiles could be prepared in a more or less laboratory type fashion. The missiles would only be wheeled out to the launching site a few minutes prior to the launching.

The military at the time told us continuously that it was a hopeless undertaking to build and to operate such concrete pens, such fixed installations, in view of the unchallenged Allied air superiority in that area.

So the military insisted on mobility, while I myself, along with my technical associates, were utterly skeptical that the V-2 was sufficiently advanced for mobile development.

Finally a compromise was reached. A few of these pens were actually built while we also continued pursuing the mobile concept.

ALL MOBILE PLATFORMS ESCAPED DESTRUCTION

The net result was that all the pens were completely destroyed before they were ever put in operation, and that not a single V-2 missile was ever lost at a mobile launching site—and this despite the fact there was a 30-to-1 air superiority by the United States Air Force, along, of course, with the Royal Air Force, in that area.

Mr. WEISL. In other words, the Royal Air Force and the American Air Force destroyed the static launching platforms, but most of the mobile platforms were saved?

Dr. VON BRAUN. All of them.

Mr. WEISL. All of them were saved?

Dr. VON BRAUN. Yes. A number of V-2's were lost during transportation on the roads and on railway trains, but there is not a single case on record where a V-2 was destroyed in a mobile launching site, and I believe with the V-1 missile they had exactly the same experience.

Mr. WEISL. From your experience in supervising the work on the Redstone missile and the Jupiter missile, you agree with General Gavin, I take it, that they are mobile?

Dr. VON BRAUN. Yes.

Mr. WEISL. And mobility should be the fundamental purpose in the use of those weapons?

Dr. VON BRAUN. Yes, sir. I am convinced of this. In the Redstone missile we have achieved complete mobility, not movability, but mobility, true mobility. With the Jupiter missile, such mobility can even easier be attained than with the Redstone, because the empty weight of the missile is less. The Jupiter is shorter and lighter than the Redstone.

Mr. WEISL. Dr. von Braun, will you tell the committee briefly how you managed to escape from the Russians as they were approaching Peenemuende?

Dr. VON BRAUN. By January 1945 the situation in Peenemuende was the following: The Russian Army was approaching from the east, it was about 100 or 80 miles from Peenemuende, so close that we could already hear the artillery fire at night.

It was very obvious to me and my associates that the war was lost, and that the decision whether we wanted to wind up on the east side or the west side had to be made now before the Russian Army arrived.

So I held a meeting, and we took a vote, and there was unanimous vote to the effect that we should go west.

Now, to implement this resolution was not quite that simple, because we were in the rear area of the fighting front, and there was much confusion going on.

Military agencies in our area had already moved out, due to the general air raid situation. For the same reason we had scattered many of our operations over the countryside. Also our development plant had been converted into a private corporation in the meantime. So I was pretty much on my own, and the directives we got from the various headquarters were utterly conflicting and confusing.

I remember we had about 10 different directives. About five said "You stay put right here and all you men will defend the Peenemuende

area whenever the Russian Army moves in"; and the other half of the directives said "Move out."

So we could take our pick. But the chances, or the risks, taken in either case were quite high, because all those directives were quite strongly worded.

We finally evacuated most of our equipment with the help of the Navy. We used those directives that told us to evacuate as a basis to issue ourselves passports through that rear army area, and with a little bluffing we fought our way through.

We finally wound up partly in central Germany and partly in Bavaria. There we were ultimately run over by the American Army.

Mr. WEISL. Were you able to escape to the American Army with equipment?

Dr. VON BRAUN. Yes, sir. We moved a total of 12,000 tons of equipment out of Peenemuende, but I would say only about 2,000 tons ever reached the American Army, because much of it was lost during the evacuation period.

We moved most of the heavy equipment with the aid of barges that were towed up the Elbe River, and there was much fighting going on. In fact, it was along the Elbe River that the American Army and the Red Army established contact, so there was much shelling going on, and many of the barges were sunk.

So only about 2,000 tons, but I would say the most important equipment, finally wound up in American hands, including the documents covering our scientific and engineering work.

Mr. WEISL. In other words, you delivered the equipment and documents and all the supporting data you could bring with you to the American Army?

Dr. VON BRAUN. That is right.

Mr. WEISL. Did many of the scientists and technologists of Germany go over to the Russian Army?

Dr. VON BRAUN. There was, of course, the V-2 production going on which involved a great number of component manufacturers all over Eastern and Western Germany, in addition to the assembly plant.

The Russians overran the assembly plant where they found lists of those component suppliers. All they had to do was to go back to the component suppliers. There they found many components for the V-2 production that were still in the pipelines, in various states of completion. With the help of this equipment and the personnel located at these plants, they got the V-2 production program started again.

Essentially they assembled a substantial number of missiles from what they found in the pipelines of production.

VON BRAUN DOES NOT ATTRIBUTE SOVIET SUCCESS TO GERMANS

Mr. WEISL. Dr. von Braun, the opinion prevails, to some extent, in many circles that the German scientists were responsible for the great success that Russia has achieved in the missile field. Do you share that opinion?

Dr. VON BRAUN. No; I do not.

Mr. WEISL. Were the German scientists that you talked to, or were informed of, who returned from Russia allowed even to see the

Russian missile plants or the Russian development centers for missile plants?

Dr. VON BRAUN. No, sir. I had the opportunity to read some reports on the German returnees from Russia. These reports, if I remember correctly, were written and circulated in the Department of Defense around 1954 and early 1955.

The story on the experience of those returnees from the Soviet Union ended in 1952 or early 1953, and these reports were essentially—these reports were what is called, in the intelligence lingo, “debriefings.” In other words, whenever a German rocket scientist came back from Russia and appeared either in Berlin or in West Germany, he was interrogated on what he had seen there. On the basis of these reports, I personally came to the conclusion that the Russians not only had made very poor use of the German talent they had taken along to Russia, but actually that there was a lot of mismanagement in their missile program. I came to the conclusion, which later on proved to be entirely erroneous, that the Russian program wasn’t very convincing, and not really dangerous.

I think Senator Symington will remember the discussion we had at that time. Senator Symington asked me, “How come you made a statement in public that you don’t think the Russians are ahead of us?” and I quoted my sources.

Shortly thereafter, I obtained my American citizenship. General Gavin then decided it was about time for me to get the real story, what we really knew about the Russian program. And then, I must say, my opinion changed completely. It became obvious to me that those Germans that had been taken to Russia not only were poorly used but they were actually left completely in the dark about the fact that there was a Russian program outside of their own operation, outside of the places to which they were assigned.

Mr. WEISL. Please tell the committee, Dr. von Braun, if you can, what the German scientists did in Russia, and what the Russians did themselves in developing missiles.

Dr. VON BRAUN. A very significant thing, for example, was that these debriefing reports contained requested statements that those German scientists weren’t even encouraged to learn Russian. So they wrote reports from memory on how they did this and this, in German, and they were told: “Don’t worry about the translation, we will take care of that.”

Some returnees mentioned that they found their own reports in Russian translation later on, in some files in Russia, with their own names omitted. Somebody else had simply signed the reports for them. So it was even hidden from the Russians that some of these papers were written by a German. But most of these reports were limited to the kind of thing “Tell us how you did this,” or “Tell us how you did that.” It was nothing constructive. It was only re-constructive.

Mr. WEISL. Is it your opinion, Dr. von Braun, that the Russians could have accomplished what they had, or what they do have in the way of missiles, without the Germans?

Dr. VON BRAUN. Sir, I would put it this way: When I say that I don’t believe that the German scientists had a hand in this Russian development, I do not necessarily mean that Russia did not base their missile development on, shall we say, the V-2 background. They certainly did that.

They found, as I mentioned before, the assembly plant; they found drawings, documentation, reports, copies of practically the whole scientific and technological missile archive, the report library that grew out of the V-2 program. I am convinced that the Russians took very great pains in evaluating every little bit of information that they found. They have a wonderful translation system, and a very efficient foreign source scientific evaluation system, so they certainly made full use of everything they found. But they definitely did not let the German scientists they took into Russia take part in their active missile development.

Mr. WEISL. You do not underestimate the ability of the Russians to make and develop and plan and research into the missile field; do you?

Dr. VON BRAUN. No, sir; I don't.

Mr. WEISL. Do you believe the Russians are ahead of us in this field?

Dr. VON BRAUN. In the ballistic missile and satellite business, definitely; yes, sir.

Mr. WEISL. Dr. von Braun, without going into too much detail, and without repeating the testimony of General Medaris which you, I believe, listened to, will you please tell the committee what impediments or bottlenecks or restraints there are in developing a missile program in the United States.

Dr. VON BRAUN. General Medaris mentioned quite a few of the daily problems that we have to cope with. For example, we received a decision to produce the Jupiter, but we don't get the funds to finance the production. We have to let a contract now, or rather several contracts, but that money hasn't been forthcoming yet.

This is a typical difficulty. I am convinced that some day the money will be coming, but in the meantime 6 valuable weeks have been lost.

Senator JOHNSON. I think this can stand some repetition, so you just follow the counsel's suggestion and tell this committee every impediment that you have encountered and, through this committee, tell the country.

IMPEDIMENTS TO THE MISSILE PROGRAM

Mr. WEISL. You have been associated with this program, Dr. von Braun, from the beginning. You started with the V-2, which you brought over here. From the V-2, you went to the Redstone. From the Redstone you went to the Jupiter, so that you know exactly what has happened, and you have told me in our interviews, point by point, what has stymied the development of this program, and everything that has delayed the development of the program, so let us take point by point, and tell this committee, and lay it on the line, just what has happened to stymie the development of this program.

Dr. VON BRAUN. Well, sir, at first, there was a period of approximately 6 years, between 1945 and 1951, where we did not work at the Redstone missile. We lived in Fort Bliss, Tex., at that time, and our main task was to support a scientific high-altitude research program, using V-2 rockets. In addition, we were given the task to develop a small, experimental missile, also based on the V-2, that was called Hermes II. I would say this was the maximum we could do with the

facilities we had. Hermes II was not even meant to be a weapons system. It was a kind of a long-range research vehicle, based on rockets and ram jets.

Mr. WEISL. Did you ask, during that period, for other facilities?

Dr. VON BRAUN. Well, sir, the entire operation at that time was on such a modest scale that it would have been entirely impossible to start a major program.

Mr. WEISL. Did you realize, from your experience, that this program was too modest to accomplish what was needed?

Dr. VON BRAUN. Well, sir, I am convinced that it takes time to build up momentum in technological developments. I am convinced that, had we continued our operations at Peenemunde with the same momentum that developed during the war, we could have produced an ICBM in 1950. But this, of course, is a very unrealistic way of looking at things. The war was over, and the general atmosphere in those postwar years was. "The war is over; let us utilize these interesting new toys that we imported from Europe, and let us put them to use for high-altitude research." There was not a single high-priority weapons program going on in the entire missile area at that time.

I am not trying to blame anybody by saying that. I thought it was entirely understandable. People were just happy that the war was over and that they could devote their efforts and their energies to something else.

Mr. WEISL. Yes, sir. Now, Dr. von Braun, when you did start making the intermediate missile, tell us what impediments you encountered.

Dr. VON BRAUN. In 1951, we began the Redstone missile. This program was initiated very strongly, promoted by the then Director for Guided Missiles, Mr. K. T. Keller. I would say, when he came in, things began to move.

Mr. WEISL. When was this?

Dr. VON BRAUN. This was in early 1951. Mr. Keller was the man who said, "Let's build an operational ballistic missile."

Mr. WEISL. What was his title; do you remember, Dr. von Braun?

Dr. VON BRAUN. Mr. Keller was president, and later chairman of the board, of the Chrysler Corporation.

Mr. WEISL. I mean what was his title in connection with guided missiles with the Government, if you know?

Dr. VON BRAUN. Director of Guided Missiles.

Mr. WEISL. And who brought him in?

Dr. VON BRAUN. The Department of Defense, the Secretary of Defense, whoever that was in 1951. I think Mr. Lovett.

Mr. WEISL. Was that Mr. Lovett?

Dr. VON BRAUN. I think so. Anyway, it was under the Truman administration.

Mr. WEISL. It was Mr. Lovett. Now, proceed, and tell us what obstacles, if any, you encountered right from the beginning and throughout the experience that you had.

Dr. VON BRAUN. Our work for Mr. Keller was most pleasant. I had the impression that he was a very competent and capable man.

Mr. WEISL. I am sure he was, but we are trying to find out what obstacles, if any, you encountered. We know that Mr. Keller was a competent, able, fine man.

Dr. VON BRAUN. I would say there were no obstacles. The difficulty was, while very little had been done for 6 years, all of a sudden money and resources, everything, was thrown at us, and now Mr. Keller was asking for the impossible all of a sudden.

Mr. WEISL. Tell us what happened, please.

Dr. VON BRAUN. Well, I remember that the first program schedule under which he wanted us to handle the Redstone was so ambitious, as far as getting production started, that we told him: "You had better go a little slower, because, if we start producing untested hardware at this scale, then a lot of that hardware will probably wind up on the junk pile. There will be so many modifications before it really works that we would be operating beyond the point of diminishing returns."

So, at our request, the program was then somewhat relaxed.

Mr. WEISL. In other words, you wanted to do research and development during that period?

Dr. VON BRAUN. No, sir. I would say we had done a lot of quiet research in those last 6 years, when there was no crash program. But Mr. Keller's ideas on the production buildup and how fast we could design and finish the Redstone missile were beyond our capabilities. We felt we needed more time to do it.

Mr. WEISL. You were talking about the Redstone missile?

Dr. VON BRAUN. I am talking about the Redstone missile in 1951.

Mr. WEISL. What was the range, or contemplated range, of the Redstone missile?

Dr. VON BRAUN. It was contemplated as a 175-nautical-mile missile right from the beginning.

Mr. WEISL. And when did you abandon the Redstone—or, rather, when did you go into the—

Dr. VON BRAUN. May I correct myself?

Mr. WEISL. Yes.

Dr. VON BRAUN. The history of the Redstone was a bit more involved. At first, we were asked to make studies of what range we could attain with a guided ballistic rocket, using rocket engines available in this country. The payload weight that we were told to consider in these calculations was less than what the Redstone now carries. Thus, the first studies envisioned a missile of something like 400- or 500-mile range, but, when the details were worked out and our program was finally coordinated with the AEC warhead program, it was decided to use a heavier warhead. This reduced the range substantially, and this is how we finally wound up with the 175-nautical-mile range.

Mr. WEISL. When did you go into the Jupiter missile field?

Dr. VON BRAUN. We made paper studies for the Jupiter during the summer of 1955. The green light was given around December 1955, if I remember correctly. In February 1956, the Ballistic Missile Agency was established under General Medaris' command.

Mr. WEISL. And will you tell us what obstacles or bottlenecks or difficulties, if any, you encountered?

Dr. VON BRAUN. I would say at first things were going very smoothly. We had everything we asked for, and it was only after about a year or so that—how shall I express myself—that the termites got into the system.

Senator JOHNSON. The what?

Mr. VON BRAUN. The termites.

Senator JOHNSON. Termites.

Dr. VON BRAUN. As General Medaris mentioned before, the money was allocated, but somebody withheld it, and we got only part of it.

Senator JOHNSON. When did the termites come?

Dr. VON BRAUN. I would say we had clear sailing for about a year.

Senator JOHNSON. When did the termites come?

Dr. VON BRAUN. The difficulty began when the roles and missions assignment for the IRBM was given to the Air Force, and more and more people doubted whether the Jupiter would really go into production, and, so, people were withholding final approval.

Mr. WEISL. Tell us what happened, please, Dr. von Braun. Did you have difficulty getting money, the money that you needed?

Dr. VON BRAUN. Yes, sir.

Mr. WEISL. Did you have difficulty in getting the money on time?

Dr. VON BRAUN. Yes.

Senator JOHNSON. Get that date; that is what I want. About what time, what month, and what year, that the termites got there.

Dr. VON BRAUN. I would say it began about November 1956, that difficulties began.

Senator JOHNSON. November 1956?

Dr. VON BRAUN. Yes, sir.

Mr. WEISL. Now, tell us what those difficulties were, beginning in November 1956, point by point. Take your time, Doctor.

JUPITER PRODUCTION UNFUNDED AS YET

Dr. VON BRAUN. You can save time in our arsenal-prime contractor concept when you phase in the prime contractor as early as possible, when you give the prime contractor time to work along with the developer, to start building his tools.

Now, in view of the fact that nobody knew for sure whether the Jupiter would ultimately be selected for production, there was this continuous delay. People would say, "Now, let's wait until that committee comes next week that will make a final recommendation, and if that recommendation is favorable you will get the money." And then the committee would make a recommendation, but as the result of that recommendation still no decision was made, and so the thing just dragged on. Up to this very moment, we haven't got the money for the Jupiter production yet.

Mr. WEISL. Before you go into production, you have to pass the feasibility and development stage, and that is important because, unless you pass that stage, you can't go into production?

Dr. VON BRAUN. This is right, Mr. Weisl.

Mr. WEISL. Did you have any difficulty in the development and feasibility stage? In other words, Jupiter is not in production now?

Dr. VON BRAUN. No; I would say in this area, we actually—

Mr. WEISL. Tell us what difficulty, if any, you had in passing the development stage, the feasibility stage, and the research stage.

Dr. VON BRAUN. Sir, I would say our development actually came along even better and smoother than we had expected. Our records show the number of missiles we predicted in January 1957 we would fire during 1957.

Mr. WEISL. I know it was better than you expected, but tell me—

Dr. VON BRAUN. We fired two more than we had expected we could.

Mr. WEISL. You fired more than you expected?

Did you have any difficulty in getting this program going?

Dr. VON BRAUN. No, sir.

Mr. WEISL. Did you get decisions in the Defense Department quickly?

Dr. VON BRAUN. No, sir; I would say the difficulties were not in the research and development area. The difficulty was that you must get production started, even if you are still in the research and development phase, because you have long lead-time problems in certain areas.

For example, production and acceptance test facilities must be modified, and if you get approval for this kind of thing only after you have demonstrated that the weapon works, then you lost time. This is the area where we had the greatest difficulties.

Mr. WEISL. Tell the committee, please, in what respect you lost time.

Dr. VON BRAUN. Well, we could be much further ahead today at the Chrysler Corp. with the tooling for the Jupiter, had General Medaris been told half a year ago that Jupiter will definitely go into production, and that Chrysler is definitely the contractor.

Mr. WEISL. You weren't told that Chrysler would go into production as the contractor; is that it?

Dr. VON BRAUN. It wasn't even clear whether the Jupiter was to go into production.

Mr. WEISL. But you were working on it, looking toward the time when it would go into production, weren't you?

Dr. VON BRAUN. We were; yes.

Mr. WEISL. You were testing it?

Dr. VON BRAUN. Yes.

Mr. WEISL. You were making the hardware in prototype fashion?

Dr. VON BRAUN. Yes.

Mr. WEISL. You were working on the propulsion system; you had contractors working on the guidance system; you were doing research with scientists. Did you have any difficulty? Was your work impeded?

Dr. VON BRAUN. Not in this area, but there would have been——

Mr. WEISL. In what area was it impeded? Please tell the committee in what area it was impeded, if any.

Dr. VON BRAUN. It was impeded because due to this delay in the production decision it could be clearly foreseen that there would be a gap between the development, research and testing phase and the actual production. And therefore availability of the Jupiter missile in the field would be delayed.

Mr. WEISL. Did you go to the Pentagon and ask for decisions?

Dr. VON BRAUN. General Medaris did, once a week.

Mr. WEISL. How often did you go?

Dr. VON BRAUN. Twice a month.

Mr. WEISL. Why was it necessary for General Medaris, who was working to get these missiles done, to go from Alabama to Washington once a week, and for you, his Chief Director to go twice a month? You told me why before. Now tell the committee why, Dr. von Braun.

Dr. VON BRAUN. For example, I had to go quite frequently because there were committee hearings here in Washington, not hearings like this here, mind you, but technical and scientific committee hearings. I had to justify very often why we were doing things this way and not that way, and why the Air Force does it this way, and why we think that way is better, and so forth, and this, of course, cost much of my time.

Mr. WEISL. Were these committee hearings constructive for you?

Dr. VON BRAUN. Sir, I think we have too many committees in this area. I believe that scientific and technical committees made a very fine contribution early in the missile business, for example in arriving at decisions on what should be done in the ICBM area.

Mr. WEISL. Dr. von Braun, may I help you a little, please. When you and I talked in the Pentagon, you told me that one of your chief difficulties was your inability to ever get a decision from the Defense Department; is that true?

Dr. VON BRAUN. That is right, sir.

Mr. WEISL. Please tell the committee about that. We know that some committees are necessary. We know that fine men serve on those committees, but we want to know what impeded you from doing your work quickly.

Dr. VON BRAUN. Sir, I think there is a difference between a committee that evaluates something and a committee that continuously interferes with executive operations.

Mr. WEISL. Were you continuously interfered with?

Dr. VON BRAUN. Yes, sir. The mechanism in the Pentagon works something like this: Attached to every Assistant Secretary or Director for Missiles or whoever it is, on practically every level, there is an advisory committee advising that particular Assistant Secretary on what is right and what is wrong. And since that man wouldn't make a decision without advice from his committee, you can't bypass the committees.

Mr. WEISL. Was this system of the Secretary going to the committee, and then you justifying yourself to the committee impeding you in your work?

Dr. VON BRAUN. Yes; definitely. We were very often confronted with the fact that a decision on this or that question wouldn't be made before a certain committee had a chance to talk to you or listen to you, and make its final report.

Mr. WEISL. Did that committee consist of experts in the missile field?

Dr. VON BRAUN. Well, sir, put it this way: Most people that have real practical experience with missiles are busy building missiles these days, and since men actively engaged in missile projects are not eligible to serve on these committees—

Mr. WEISL. Dr. von Braun, you told me, did you not, and I do not know why you hesitate in this hearing, because we have had several talks, that while the men on these committees were fine men in certain fields, they did not know a thing about missile production.

Dr. VON BRAUN. I did not express myself that harshly, Mr. Weisl. [Laughter.]

Mr. WEISL. Well, tell us how you did express yourself, Doctor.

Dr. VON BRAUN. Many, I would say the great majority, of the gentlemen serving with these committees are brilliant scientists and ex-

perts in their particular fields. But the missile business, particularly once a missile project really gets going, involves many questions which are, I would say, nonscientific in nature; they have something to do with project management or time schedules.

For example, a physics professor may know a lot about the upper atmosphere, but when it comes to making a sound appraisal of what missile schedule is sound and how you can phase a research and development program into industrial production, he is pretty much at a loss.

Senator JOHNSON. Doctor, is it fair to say that the problem you found is that you have got too many committee advisers advising the advisers?

Dr. VON BRAUN. Yes, sir; I would say these committees should have their place. They should evaluate programs, and should help screen programs; they should screen technical suggestions as to their soundness of approach. But when it comes to running projects, there should be more executive power, there should be a strong project management; and once it has been decided to do something in a certain fashion, the project manager should be boss.

Mr. WEISL. Now, you told me of these committees in the Pentagon, and that you saw them twice a month yourself?

Dr. VON BRAUN. I said I went to Washington twice a month, but not only to see committees. But the committees took a very substantial portion of these visits.

Mr. WEISL. All right. General Medaris had to come approximately once a week to meet these committees?

Dr. VON BRAUN. Not the committees, but also other people, to pry the money loose.

Mr. WEISL. To meet somebody to pry the money loose and to get decisions?

Dr. VON BRAUN. Yes, sir.

Mr. WEISL. And then some committees came out to monitor you; did they not?

Dr. VON BRAUN. Yes, sir.

Mr. WEISL. How many committees would come out to monitor your work?

Dr. VON BRAUN. Well, how many do we have? Five, maybe.

Mr. WEISL. At Huntsville?

Dr. VON BRAUN. Yes. Sometimes a committee does not come together, as a group, but single members of the committees come visiting.

Mr. WEISL. Well, how many times did the committees or members of the committees come to Huntsville to monitor your work?

Senator JOHNSON. We are talking about the Defense Department?

Mr. WEISL. From the Defense Department.

COMMITTEES CONSTANTLY VISITED INSTALLATION

Dr. VON BRAUN. I think our visitors' record would show there has not been a week in the last 2 years that some members of a committee have not been visiting our installation.

Senator JOHNSON. A committee a week?

Dr. VON BRAUN. At least one committee member a week has been visiting our installation.

Senator JOHNSON. A representative of some Defense Department committee has been monitoring you once a week for the last year?

Dr. VON BRAUN. Yes, sir. Individuals, individual members of these committees. They would come to get from us "a little background information for my work for the committee."

Mr. WEISL. Did they help you in your work?

Dr. VON BRAUN. I would say sometimes these discussions are very interesting. [Laughter.]

Mr. WEISL. I am not talking about whether they are interesting. You told me that you were monitored by committees and members of the committees, both at Huntsville and in the Pentagon, by people who were fine men in their field, but knew very little about the missiles that you were working on; is that true or not true?

Dr. VON BRAUN. Yes, sir, that is true; that is true.

Mr. WEISL. And that impeded you in your work, did it not?

Dr. VON BRAUN. Yes, sir; and I would say it impedes probably other missile projects also.

Let me make one thing very clear. I think these committees have their place at the beginning of new missile projects. But once the word "go" has been given and the general design has been agreed upon then these committees should yield the executive power to the people who run the project.

Senator JOHNSON. Did it seriously interfere with your work?

Dr. VON BRAUN. Yes, sir; it did.

Senator JOHNSON. Would it seriously interfere with your work if the committees did not visit you once a week?

Dr. VON BRAUN. Yes, it did.

Mr. WEISL. You mean it did seriously interfere with your work by having the committees visit you once a week?

Dr. VON BRAUN. Yes, sir; it did.

Senator JOHNSON. Would it hurt you if they cut them off now and stopped them from coming?

Dr. VON BRAUN. Sir, the important thing is not that the visits bother us, but the fact that you cannot get a decision out of the Pentagon before these committees have made their recommendations at the various levels of the Pentagon.

Mr. WEISL. In other words, the committees come out to see you or one member of the committee——

Dr. VON BRAUN. Yes, sir.

Mr. WEISL. And often these members do not know anything about missiles?

Dr. VON BRAUN. Sir, I didn't say that.

Mr. WEISL. Sir?

Dr. VON BRAUN. I did not say that.

Mr. WEISL. What did you say?

Dr. VON BRAUN. I did not mean it, either. [Laughter.] I think that there is a difference between being a scientist and expert in a certain area who can express his professional, scientific opinion on a scientific problem, and being able to appraise a missile program as a whole.

I believe an established missile program, like the Jupiter, has much more similarity with an industrial planning job than with a scientific project.

THE PROBLEM IS LARGELY ENGINEERING

Mr. WEISL. May I ask you this, Dr. von Braun: Your job in building the Jupiter and developing it was not a scientific problem but an engineering problem; is that right?

Dr. VON BRAUN. I would say it was 90 percent engineering and 10 percent scientific, and in these scientific areas we love scientific advice.

Mr. WEISL. And the scientists who came out to see you were not engineers?

Dr. VON BRAUN. That is right.

Mr. WEISL. They were scientists?

Dr. VON BRAUN. That is right.

Mr. WEISL. And they did not help you, did they?

Well, tell us frankly, Doctor, as you told me.

Dr. VON BRAUN. Sir, there are many areas where we even go to them and ask for their advice, but I think to expect a scientist to have all the answers to everything—my personal feeling, to be frank about this, is as follows: I believe that the prestige factor plays a very important part in these things. When confronted with a difficult decision involving several hundred million dollars, and of vital importance to the national defense, many Pentagon executives like to protect themselves. It helps if a man can say, "I have on my advisory committee some Nobel prizewinners, or some very famous people that everybody knows." And if these famous people then sign a final recommendation, the executive feels, "Now, if something goes wrong, nobody can blame me for not having asked the smartest men in the country what they think about this."

Mr. WEISL. But, when you are trying to get a missile developed and in operation, you do not want to be protected by asking smart scientists about it, do you?

Dr. VON BRAUN. No; I think, in the last analysis, somebody has to stick his neck out anyway.

Senator JOHNSON. Did you get any help from any of these visiting committeemen? Did they contribute anything to the job you were doing?

Dr. VON BRAUN. Yes, sir; they did. But in detailed areas, not in the overall plan of the project.

Mr. WEISL. Who sent these scientists down there to Huntsville? Did you ask for them?

Dr. VON BRAUN. No, sir. The way——

Mr. WEISL. Who sent them down?

Dr. VON BRAUN. The way it goes, we get a piece of paper saying that a new committee has been established, and will come to visit us. [Laughter.]

Mr. WEISL. How would you run this project? Let us try to get at it this way: You are assigned with the responsibility of this project under General Medaris. Now, tell the committee, as you told us, how you would run it.

Dr. VON BRAUN. I feel it is very helpful to have scientific advisers——

Mr. WEISL. You have already made the point it is helpful to have scientists.

Dr. VON BRAUN. It is helpful to have a scientific advisory committee at a time when you kick the question around whether a certain

proposal is sound or desirable and in the country's interest and whether the performance promises made are sound, and so forth.

But, once the committee has made a recommendation to go ahead with a certain proposal and it has become an established project, then the project manager, like General Medaris here, should be put on the job. He should be asked: "How much money do you need, and what is your time schedule?" And from then on, he should have a free hand; he should have unquestioned Pentagon support and, from then on, this committee recommendation business should stop.

Mr. WEISL. Did the interference stop from then on?

Dr. VON BRAUN. As I said before, we had clear sailing for a year. After 1 year, after this question came up, "Will the Jupiter go into production or not?" we didn't get the necessary decisions from the Pentagon.

Senator JOHNSON. You have got the decision now to go full steam ahead on it.

Dr. VON BRAUN. But we still don't have the production money.

Senator JOHNSON. I am asking you; but you have permission to go full steam ahead with the Jupiter?

Dr. VON BRAUN. Yes, sir.

Senator JOHNSON. But you do not have the money?

Dr. VON BRAUN. We don't have the money.

Senator JOHNSON. How can you do it, then, without the money?

Dr. VON BRAUN. That is a good question, sir. [Laughter.]

Senator JOHNSON. Then give me a good answer.

Dr. VON BRAUN. I do not know.

Senator JOHNSON. That is a good answer. [Laughter.]

Senator JOHNSON. Go ahead and talk to any of your associates; there is no hurry. Go ahead and talk to them. You have a decision here to go ahead now, and the country has been told that we are in high gear, we are going full steam ahead with no holds barred, all out. But you have received no money. Is that what you are saying?

Dr. VON BRAUN. Yes, sir. General Medaris will be in a position to answer that question, probably, much better than I.

Mr. WEISL. You heard him answer it; you were here, weren't you, Doctor, when he answered it? Didn't he tell you Congress would appropriate the money?

Dr. VON BRAUN. Yes, sir.

Mr. WEISL. Then the Defense Department, either the Controller or the Budget Director, would not allocate it to you; is that right?

Dr. VON BRAUN. Right now, we have a request in for the procurement of Jupiter missiles; I mean production—

Mr. WEISL. Yes.

Dr. VON BRAUN (continuing). And that money isn't there, so the contract can't be let. That is the situation.

Senator JOHNSON. How long has that request been in?

Dr. VON BRAUN. I think the request was made about 6 weeks ago.

Mr. WEISL. You sit with him, General Medaris, and you can help him out, because I am afraid I might be asking the questions a little more—in a difficult manner for you, Dr. von Braun.

General MEDARIS. The problem is, gentlemen, if I might interject a second, that Dr. von Braun is the technical director of the project; the project manager is myself. He knows, by constant conference with me, what the situation is. But the handling of these very diffi-

cult, shall we say, administrative and financial problems, is, thank God, not put on his shoulders. I don't let it get on his shoulders; so this is just to put it in the frame of reference.

Mr. WEISL. Dr. von Braun, you are the technical director of this project. What difficulties have you encountered as the technical director?

Dr. VON BRAUN. Well, sir, in this particular area, of course, it is difficult to act without the money, and I think General Medaris has not denied the effect.

Senator JOHNSON. Has General Medaris the money, and is he withholding it from you? Why didn't he give it to you? He says the financial responsibility is not on your shoulders. Where is the money?

Dr. VON BRAUN. I think what General Medaris meant is it is not my job to try to pry the money loose in Washington.

Senator JOHNSON. I understand that. But it is somebody's job to get the money, and you do not have it. Is that right?

Dr. VON BRAUN. Yes.

Senator JOHNSON. And General Medaris does not have it; isn't that right?

Dr. VON BRAUN. In the case of the Jupiter production, the fact is the money is not there.

PRODUCTION FUNDED WITH RESEARCH MONEY

General MEDARIS. Mr. Chairman, you embarrass me. I haven't got the production money, but I have borrowed some money from the research and development program to get the production underway.

Mr. WEISL. Dr. von Braun, how many Assistant Secretaries for Defense have you seen in the last 6 months?

Dr. VON BRAUN. In the last 6 months?

Mr. WEISL. In the last year, say. How often have you been to the Pentagon in the last year?

Dr. VON BRAUN. In the last year? Twenty times, maybe.

Mr. WEISL. Twenty times.

Dr. VON BRAUN. It would be about that.

Mr. WEISL. General Medaris is the director of the project, and you are working under him?

Dr. VON BRAUN. Yes, sir.

Mr. WEISL. And he went approximately once a week, and you had to come 20 times in the last year. Why did you have to come 20 times?

Dr. VON BRAUN. Maybe it was only 12 times.

Mr. WEISL. Or, say, 12 times. Why did you have to come 12 times?

Dr. VON BRAUN. Well, one of the reasons I gave you was these committee appearances.

Mr. WEISL. And you were called before the committee?

Dr. VON BRAUN. These were technical committee meetings.

Mr. WEISL. What type of capability was there on these committees? Who were they—engineers, missile producers?

Dr. VON BRAUN. No, sir. These committees usually consist of, shall we say, physics professors, men in the academic field.

Mr. WEISL. Take a physics professor. Did you have any problem of physics connected with the production of the missile?

Dr. VON BRAUN. Well, for example, in the guidance area, there are certain problems of physics. The way these meetings go, for example, someone would ask: "You tell us all about the guidance system and what makes you believe you can hit that accurately." Then we have to present an accuracy analysis of the guidance system, and there are questions asked, whether the assumptions are sound, and so forth.

Mr. WEISL. Do you agree with General Medaris that a project ought to be financed from the beginning so that you know where the money is coming from?

Dr. VON BRAUN. Absolutely.

Mr. WEISL. That is absolutely necessary to finish the project?

Dr. VON BRAUN. Yes, sir.

Mr. WEISL. What is the procedure now? How is the money allocated to you? When you go to General Medaris and say, "I need so much money to get this facility or to perform this work," what happens?

Dr. VON BRAUN. What we do on the technical end is that we first list our requirements. For example, if there are facility requirements, say, a laboratory must be expanded or we need a little more floor space in a shop, we present this to General Medaris, and General Medaris handles the rest of it. He requests the money.

Mr. WEISL. Do you get it as soon as you need it?

Dr. VON BRAUN. No; definitely not.

Mr. WEISL. Should the budget be on a yearly basis?

Dr. VON BRAUN. I think that, basically, there is nothing wrong with yearly budgeting, provided one can really see a year ahead and knows what comes.

Mr. WEISL. Can you see a year ahead, under the present system?

Dr. VON BRAUN. No; right now, we cannot.

Mr. WEISL. So that, because you cannot see a year ahead under the present system, your work is impeded?

Dr. VON BRAUN. Yes, sir.

Mr. WEISL. Do you take sufficient risks in order to get your work done, or are you permitted to take sufficient risks in order to get the project done under you?

Dr. VON BRAUN. Well, sir; this risk that General Medaris mentioned that he himself took, namely, by putting research and development money into the Jupiter production contract simply because the production money isn't there, that is a very typical case of how these difficulties must be ducked.

Mr. WEISL. You do believe there are too many committees, don't you, that you have to see?

Dr. VON BRAUN. Yes, sir.

Mr. WEISL. You make a positive statement about that?

Dr. VON BRAUN. Yes.

Mr. WEISL. You would be better off without these committees, would you not?

Dr. VON BRAUN. I would say the committees are good at the beginning, but they should be left out of the programs after the program got rolling.

Mr. WEISL. But they are not left out of the program after it gets rolling, are they?

Dr. VON BRAUN. No, sir.

Mr. WEISL. So, you would say one of the difficulties is too many committees after the program gets rolling?

Dr. VON BRAUN. Yes, sir.

Mr. WEISL. And that interferes with your work?

Dr. VON BRAUN. Yes, sir.

Mr. WEISL. And stymies the time element?

Dr. VON BRAUN. Yes, sir.

Mr. WEISL. Is there too great a turnover in civilian personnel in the Pentagon, in your opinion?

Dr. VON BRAUN. Well, sir, it would, of course, help if, in these difficult scientific and technological areas, the key personalities would stay longer and have a longer time of really becoming familiar with the problems. I mean——

Mr. WEISL. In other words, you told me that when one man gets acquainted with your problem——

Dr. VON BRAUN. He usually leaves.

Mr. WEISL (continuing). And when you try to carry out his recommendation, a new man comes in and changes it.

Dr. VON BRAUN. Yes; that is about it.

Mr. WEISL. Now, is there a failure by the Government or by the Defense Department to provide for research as you are developing the Jupiter? You told me that you needed money for research concurrently with the development of the Jupiter, and that you cannot get that money.

Dr. VON BRAUN. This is a very fundamental and, I think, a very serious question; the way all these programs in the Army and the Air Force, also in the Navy, are run. The trouble is you get the priority assignment for a limited end item which, for example, is called the Jupiter missile.

PROJECT MUST BE JUSTIFIED AS PRESENTLY USEFUL

But that in itself is a dead-end street, because there will always be something thereafter. It is very significant, for example, that the development of those large rocket engines that were discussed earlier in this hearing was not approved by anybody simply because there is no need for these engines within the framework of the existing and approved missile systems.

The question is asked, very simply: "Do we need it for the Atlas?" Answer: "No." "Do we need it for the Titan?" "No." "For the Jupiter?" "No." "For the Thor?" "No." Consequently, there is no need for a big engine.

Mr. WEISL. In other words, you agree with General Medaris there is need for an engine with a large thrust?

Dr. VON BRAUN. Yes, sir.

Mr. WEISL. And that unless we get that type of engine we might be behind the Russians in the ICBM field; is that your belief?

Dr. VON BRAUN. Sir, I wouldn't say in the ICBM field, but in the general field of control of outer space.

Mr. WEISL. Now, have you joined with General Medaris in that viewpoint and talked about it publicly——

Dr. VON BRAUN. Yes.

Mr. WEISL. And presented it whenever you could present it, to whomever you could present it?

Dr. VON BRAUN. Yes, sir.

Mr. WEISL. Has anything been done about developing that kind of an engine?

Dr. VON BRAUN. In this area, too, there was a committee appointed—laughter—by the Secretary of Defense that spent a whole day with us, and I think their recommendation was quite favorable. I think they gave a favorable report, or at least they endorsed the general idea for a big engine, I don't remember the details.

Mr. WEISL. What was the name of this committee? Do you remember?

Dr. VON BRAUN. It was called the Silverstein Committee. It was headed by Dr. Abe Silverstein, of the NACA laboratories in Cleveland.

Mr. WEISL. Is that the same Mr. Silverstein who wrote us a letter saying it was impossible to get through any long-term research project?

Dr. VON BRAUN. Yes, sir.

Mr. WEISL. And he recommended, I presume, as head of such a committee, that such an engine be developed?

Dr. VON BRAUN. Yes, sir.

Mr. WEISL. Was his recommendation followed?

Dr. VON BRAUN. No, no.

Mr. WEISL. Why not? Do you know?

Dr. VON BRAUN. I presume it was dropped along with other things due to budget considerations.

Mr. WEISL. Was there another committee to pass upon the Silverstein Committee appointed?

Dr. VON BRAUN. I don't know.

Mr. WEISL. Do you know, General Medaris?

General MEDARIS. I don't believe there was above that.

Mr. WEISL. What happened to the Silverstein Committee recommendation?

General MEDARIS. It disappeared in the Department of Defense. [Laughter.]

Mr. WEISL. But that was a very vital and crucial matter, in your opinion, was it not?

Dr. VON BRAUN. Yes, sir.

Mr. WEISL. Was it not, General Medaris?

General MEDARIS. Yes, sir. Very vital.

Mr. WEISL. And was it presented in a vital and crucial way?

General MEDARIS. We so presented it to the committee.

Mr. WEISL. Did the committee so regard it as vital and crucial?

General MEDARIS. Their recommendation was quite factual. I think the committee could get the text from the Silverstein Committee report.

Mr. WEISL. But so far as you know, nothing was done about that committee report?

General MEDARIS. That is correct.

Dr. VON BRAUN. Sir, may I add a few words?

Mr. WEISL. Just a few.

Dr. VON BRAUN. I think the reason why we never got anywhere in this large engine business is the following: the tendency for warheads, for atomic warheads, is to become lighter and lighter, lighter than they are now.

Mr. WEISL. Do you think we ought to go into this in open hearing?
 Dr. VON BRAUN. I think what I am going to say here I can say in open hearing.

Mr. WEISL. All right.

Dr. VON BRAUN. I will limit myself to what I can say in open hearing.

As the warheads will get lighter, many people feel there is no trend in the ICBM area, no foreseeable trend, to build larger ICBM's in the future. The same goes for IRBM's. The Polaris, for example, is a smaller missile than the Jupiter, mainly because it has a lighter warhead. And so many people feel there is no need for a big rocket engine, because the trend is down and not up in size and weight of these long-range missiles.

Now, I think this is where the crux of the whole matter lies. Up to this point the reasoning is correct, and I agree with it.

But if you want to establish control of outer space in the broader sense of the word, not just by ICBM's but, for example, by manned vehicles capable of going into outer space, you still need those large and powerful engines. However, for these manned vehicles there is no official requirement yet, and so——

CONTROL OF OUTER SPACE AS IMPORTANT AS ICBM

Mr. WEISL. And you join with General Medaris in feeling that the control of outer space and, I might say, with General Gavin, that the control of outer space is just as important, if not more so, than the development of the ballistic missile?

Dr. VON BRAUN. Sir, I believe that——

Mr. WEISL. You join in that belief?

Dr. VON BRAUN. Yes, sir; I do. I believe there is no question that right now the IRBM and the ICBM are very important, but I am convinced that the Russian concept, as demonstrated by Sputnik No. 2 carrying this animal, is clearly much broader. They consider the control of space around the earth very much like, shall we say, the great maritime powers considered the control of the seas, in the 16th through the 18th century, and they say, "If we want to control this planet, we have to control the space around it."

Mr. WEISL. Then we will discuss outer space with you this afternoon, Dr. von Braun.

Dr. VON BRAUN. Yes, sir.

Senator JOHNSON. Dr. von Braun, we have run over our lunch period, and we will take a recess now until 2:30.

The committee will stand in recess until 2:30.

(Whereupon, at 1:50 p. m. a recess was taken until 2:30 p. m. that same day.)

AFTERNOON SESSION

Present: Senators Johnson, Stennis, Symington, Saltonstall, and Flanders.

Also present: Senator Carl Hayden and Senator Alexander Wiley.

Senator JOHNSON. When the committee recessed, counsel was questioning the witness, Dr. von Braun.

Dr. von Braun, we will resume with your testimony. We are pleased to have you. If counsel is ready, we will resume with the questioning.

The committee is glad to welcome to our deliberations the distinguished former chairman of the Foreign Relations Committee of the Senate, the senior senator from Wisconsin, and we want you to feel free, Senator Wiley, to ask any questions when it comes around to your turn.

Senator WILEY. Thank you.

Senator JOHNSON. Mr. Counsel, will you proceed with the witness.

TESTIMONY OF WERNHER VON BRAUN—Resumed

Mr. WEISL. Dr. von Braun, I tried to base my questions on the interviews that you and I have had together and on the public statements you have made and the articles you have written. I perhaps asked you questions that I should not have asked, that should have been asked of General Medaris. So do not hesitate if I ask you a question that you do not think is in your field, to tell me that you cannot answer it.

Summarizing, Dr. von Braun, will you please tell the committee in your own words what you believe and what your experience has indicated are the impediments or obstructions to the successful prosecution of your duties at Huntsville?

Dr. VON BRAUN. I think the most important problem is to put our missile program on an even keel, that we take this hot and cold blowing out of our operations. I mentioned before lunch that it was the holdup in the budgetary end that was actually delaying things, and, of course, I have nothing to do with the getting of the money, but the lack of it still affects me very greatly and directly.

We can see in the Jupiter program quite clearly how this mechanism works. Getting production of a new missile started, even if that missile is still under development, involves long lead time. In other words, you have to order material and tooling for production, and you have to prepare facilities long, long before the missile itself is ready to go.

Now, the fact that there was no decision to really produce the Jupiter and go ahead with all this meant that for months and months nothing was done in this area. Now that we have the decision, after sputnik, we are told to provide a certain number of Jupiter missiles by the end of 1958 which can be sent overseas. But since many valuable months have been lost in preparing the production facility, we as developers now have to pitch in and make up for the lost time. This means that we have to work our people overtime, we have to take them away from more important research and development work that they should be doing, and they have to fill the gap of missing long lead time items. Of course, in a development plant like ours, the lead times are shorter, and with our own methods we just have to make up for the missing missiles and missile components which cannot be supplied in time by the prime contractor.

That is how it affects me and our own operations in Huntsville. Only with a superhuman effort on the part of us developers is it possible to still make the schedule. But the fact remains that this was not necessary, and it hurts. Somebody has to pay the piper in all these things.

Mr. WEISL. And it is absolutely necessary for you to work overtime?

Dr. VON BRAUN. Yes, sir, not only overtime but Saturdays and Sundays, too. This kind of thing is pretty rough on people, and par-

ticularly in the research and development area where you expect people to make creative contributions. It is, in my opinion, very poor economy and poor management to compel these people to supply hardware which could have been supplied by a contractor, had you given him a little more lead time and had the production money been pried loose a little earlier.

Mr. WEISL. In other words, Dr. von Braun, if I understand correctly, in making up this loss of lead time that you should not have lost if proper decisions had been made in time, you have to use your creative talent?

Dr. VON BRAUN. Precisely.

Mr. WEISL. To make hardware?

Dr. VON BRAUN. Precisely.

Mr. WEISL. Instead of working on creative matters?

Dr. VON BRAUN. Precisely.

Mr. WEISL. And in making up this lost lead time, do you not also lose time in making and preparing new weapons and new concepts?

Dr. VON BRAUN. Yes, sir. This team could do more important work if we would not have to pitch in now to prepare Jupiter hardware just because the production was not started early enough.

Mr. WEISL. Now that the announcement has been made that you are expected to produce a squadron of missiles at a certain time, have you got the decision necessary to do that now?

Dr. VON BRAUN. I think I mentioned that we have the decision, but since the money still—

Mr. WEISL. I mean have you get the decision implemented so that you can go ahead?

Dr. VON BRAUN. Sir, once we have the money, we can ask our contractor, Chrysler, what his delivery schedules will be, and if the schedules do not meet the operational requirements, then we have to make up the balance. So every day we get the money later will mean that we will have to put more work into Huntsville, into our development operations, to make up for the lost time. That is essentially what it adds up to.

VON BRAUN'S WARNING AGAINST COMPLACENCY

Mr. WEISL. Dr. von Braun, in reading many of the fine articles that you have written and the very enlightening and important statements that you made, I found that you made the following statement, and I quote it, and you correct it if it is not quoted correctly:

Anyone who is overly optimistic today, who says that everything is going to be hotsy-totsy, is doing a great disservice to the country.

Did you make that statement on November 7, 1957?

Dr. VON BRAUN. Yes, sir.

Mr. WEISL. You believe that, do you not?

Dr. VON BRAUN. Yes, sir; I think it is just as valid today as it was then.

Mr. WEISL. Your commanding officer at Peenemuende was Dr. Dornberger, was he not?

Dr. VON BRAUN. That is right.

Mr. WEISL. He was a general?

Dr. VON BRAUN. Yes.

Mr. WEISL. He made the following statement on November 7, 1957, quoted in the same newspaper from which I read your statement:

There can be absolutely no doubt now that the U. S. S. R. has the means for sending an atomic or hydrogen warhead anywhere in the world.

Do you agree with the statement?

Dr. VON BRAUN. Yes, sir.

Senator SALTONSTALL. Who said that?

Mr. WEISL. General Dornberger, who is now an officer of the Bell Aircraft Co., I believe, and who was the general in charge of the V-2 project—

Dr. VON BRAUN. Yes, sir.

Mr. WEISL (continuing). In Peenemuende when Dr. von Braun worked under him.

Dr. VON BRAUN. If I may add something to his statement, I think this is not even a question of argument; it is a question of figuring it out on a slide rule. We know that Sputnik II weighs 1,280 pounds, and whatever the carrier was that brought Sputnik II up there, it could carry about 4,000 to 5,000 pounds over ICBM range. The same missile, whatever that missile was. That is very straightforward.

Mr. WEISL. I read that statement, Dr. von Braun, because there are still many who say that the newspapers are exaggerating the great danger that we face from Russia. You do not believe that is so; do you?

Dr. VON BRAUN. No; I do not think so.

Mr. WEISL. Dr. von Braun, I have read many interesting articles which you wrote about the importance of controlling outer space, and I have discussed this subject with you quite at length, and was tremendously impressed with your knowledge of that subject.

Would you mind telling the committee in your own words why you believe that it is essential, most essential, for the United States to control or at least to be in outer space as quickly as the Russians or anyone else?

Dr. VON BRAUN. Maybe I should begin with mentioning just some of the technical possibilities that exist for a nation having vehicles, particularly manned vehicles, in outer space.

SATELLITE COULD BE POWERFUL RECONNAISSANCE INSTRUMENT

To some extent my list even goes for unmanned vehicles.

In the first place, a satellite of the weight of Sputnik II would be entirely capable of accomodating a combination of optical and television equipment which could serve as a very powerful reconnaissance instrument.

You could store the pictures which such a reconnaissance satellite takes over enemy territory, and you can play these pictures back while over friendly territory.

You can do that in such fashion that your opponent cannot even jam the system, because there is absolutely no radio contact between the satellite and the ground while the pictures are taken—the satellite is deaf to any kind of radio transmitter located on enemy territory. The satellite receiver is not even turned on while over the territory it is photographing or mapping.

This can be done with an unmanned satellite. With a manned satellite the same technique can be refined to the point that you can

concentrate on details of targets that have already been recognized as being of particular interest. For example, construction work going on inside a country.

I do not believe there would be any amount of privacy, in the sense of military preparations, left, once such a satellite is available.

Remember that a satellite like sputnik goes around the earth about 16 times a day, so it will be approximately twice a day over every point on earth. And even if you have an overcast lingering several days or a week over a certain area, a simple statistical investigation indicates that there will never be a period of more than a week to 2 weeks where you don't have a clear record on what goes on at every spot on earth.

This is the satellite reconnaissance capability.

In addition to this, there exists a bombing capability from orbital vehicles. When I say orbital vehicles, I do not necessarily mean large manned space stations only.

I mean all kinds of manned vehicles capable of orbital or near orbital flight.

These vehicles may just be airplane-type top stages of rockets that go around the earth a few times, or they may be vehicles or permanent stations orbiting for weeks or months. They may be vehicles capable of changing their orbital paths or orbital behavior in between, so as to interfere with possible enemy countermeasures.

All such orbital vehicles can drop bombs on any point on earth with a very high accuracy.

Now when I say "drop bombs" I do not mean they simply release the bomb. Because in an orbit the bomb, won't fall down, it would just continue to orbit. But you can decelerate such a bomb by a small rocket so that it reenters the atmosphere under a shallow angle, and during the ensuing glide through the atmosphere, you can guide the bomb into the target.

The important thing about this technique is that there will always be an optical line of sight connection between the guiding orbital vehicle from which the bomb was detached, and the bomb itself. And ultimately, as both go around the earth, the target will also appear in view of the orbital vehicle, so that at the end, when it comes to aiming exactly at the target itself, you have direct line of sight connecting both between the bombing vehicle and the bomb, and the bombing vehicle and the target.

This permits guiding methods very similar to those presently used with anti-aircraft missiles. It is very straightforward, in a way even simpler than anti-aircraft missile guidance.

A very important aspect of such orbital bombing techniques in my opinion is that it is even applicable to moving targets such as aircraft or fleets or single ships on the ocean. Against such targets an IRBM or an ICBM is rather helpless, due to the unavoidable delay between acquisition of the intelligence on the exact location of the target at a given instance and the time needed to relay that information back to the launching site.

During the flight time of an ICBM even a slow ship could make a very effective evasive maneuver. Not so against an orbital bomb, an orbital guided bomb.

Mr. WEISL. So that, Dr. von Braun, if the Russians should control outer space with satellites, manned or unmanned, before we do and

before we get up there, it is your opinion that this country would be in mortal danger?

Dr. VON BRAUN. I am firmly convinced of that.

I mentioned only two aspects of military satellites. Maybe I should mention a third one. It may be less glamorous than the rest of them but I think it is of very great and immediate importance.

Our ICBM defense plans are based on the very fundamental assumption that we can pick up an approaching ICBM or IRBM by radar.

Right now we have already two sputniks going around the earth:

Sputnik No. II consists of 3 parts, and No. I consisted of 2 parts, of which 1 apparently reentered into the atmosphere in the meantime. So there are still 4 objects going around the earth and a few weeks ago it was 5 objects.

Now these 5 objects go around the earth 16 times a day, which means that they constitute "80 potential ICBM's a day" for the radars that would have to keep track of these things.

Now an anti-ICBM radar would have to acquire an approaching ICBM when it comes over the optical horizon.

To find out whether the acquired object really is an ICBM shooting at me, or whether it is just another part of a sputnik going in an orbit around the earth, requires acquisition and identification of each object. Only after the evaluation clearly identifies the object as a "harmless orbiter" can it be rejected from the list of potential ICBM's and the radar be freed to deal with another object.

This means that by putting a sufficient number of orbital decoys into orbit, you can saturate an anti-ICBM radar defense system, a very expensive multi-billion-dollar radar defense system, even before it is built.

I have not heard of a better method yet to do something about this dilemma than just to go up there and provide a kind of an orbital garbage collection system to get these decoys out of the orbit again.

To cope with this problem by simply building more radars appears hopeless. For a thousand pounds weight allowance you can build so many of these decoys that you can saturate any radar system. I think this problem alone may be a very important reason why something must be done about this business of control of outer space.

Mr. WEISL. Now, what would you do about it, Dr. von Braun? Would you give the satellite program at least as high a priority as you would the ballistic missile program?

Dr. VON BRAUN. Sir, my feeling is the following: I think our present IRBM and ICBM programs, including the Polaris submarine IRBM program, deserve the highest priority we have today. But I am convinced that with the development teams we have available today, we can get a space program, a long-range space program; going without putting many more scientists into the total effort than are in there right now.

It would cost additional money, but I believe that such a space program may have a rather beneficial effect, in that it would serve to stabilize the existing missile teams.

There will always be ups and downs in the missile business, and I think one of our greatest difficulties right now is that every time a development program is over the hump, there is a mortal danger for that development team to fall apart.

In the missile business, I hope you will excuse my expression, we are talking too much about the apples and too little about the apple

trees. We want apples every year. The best and most efficient way of getting a good apple crop every year is that you treat your apple trees well, that you fertilize them. And if there is a bad year, which happens every now and then, you give them even more fertilizer.

Our technique in the past has been, we pick the apples and then we chop off the apple tree. And then we are greatly surprised that next year we have no apples.

Mr. WEISL. You do believe, Dr. von Braun, do you not, that we have the scientific ability and pool of scientists and technologists today—

Dr. VON BRAUN. Yes, sir.

Mr. WEISL (continuing). To do this job if it is managed properly.

Dr. VON BRAUN. Yes, sir. I believe that there will always be times when a development team is available to take on a new assignment and when such an assignment is even badly needed in order to keep the team intact.

NAVAHO PERSONNEL AVAILABLE

I wouldn't be a bit surprised, now this may sound incredible, but I wouldn't be surprised if 20 to 30 percent of our national guided missile development capacity today was just desperately hoarded and held on company payrolls today without an assignment.

Take, for example, the situation at North American Aviation today. They lost the Navaho project a couple of months ago. Now that whole Navaho team, several thousand people, is standing by and waiting for a new assignment.

I am thoroughly convinced it costs the company a lot of money to keep that team on the payroll, while they are fishing around to get new assignments. In the meantime these people could do something more worth while.

Mr. WEISL. These people could work on the satellite?

Dr. VON BRAUN. Yes; for example—we have quite a few such development groups in the country which are standing by, which are between projects, shall we say. They could take over partial assignments in this space program.

Now, I have given this question, namely as to how such a space program could be organized, considerable thought. There are, of course, conflicting opinions on this subject among the services. And the scientific community again thinks it ought to be done a little bit different than the way the Department of Defense thinks it ought to be handled.

But I think there may be a solution to this which would make everybody happy, or at least 80 percent of the people happy, which would be quite a good batting average.

Mr. WEISL. And also secure.

Dr. VON BRAUN. Yes, sir.

What I think could be done is this: Suppose, shall we call it, a National Space Agency were set up, either under the Secretary of Defense or as an independent agency, and this agency were given its own budget. We have made a detailed plan as to what it would take to run such a thing and just to quote a figure here, we are thinking about \$1.5 billion a year. This is in addition, of course, to what is

presently spent on the military missile programs. This money would be strictly for this long-range space program, for the conquest of space.

When forming this agency, it should also be clearly understood that this is a long-range proposition, that this yearly going rate would be something to plan and rely on, say, for the next 10 years.

Now, this Space Agency would have to set up its own in-house master planning organization where competent people would plan a course of action, a stepwise course of action, on how to proceed to attain certain milestones. For example, to put a man into an orbit on a returnable basis within the next 5 years, and to have a manned space station, say, in 10 years.

The Space Agency should also be free to let project management contracts in certain subareas included in the overall scope.

Senator JOHNSON. Pardon me, did I understand that is to be an independent agency?

Dr. VON BRAUN. Sir, I said it could be either under the Secretary of Defense or as an independent agency. I think the scientific community would prefer having it an independent agency.

Senator JOHNSON. Would that be your recommendation?

Dr. VON BRAUN. Sir, I would suggest to give everybody a day in court before a final decision is made in this area.

Senator JOHNSON. We would do that, but I thought maybe you were ready to have your day today. [Laughter.]

Dr. VON BRAUN. Well, I would prefer to listen to the other people first. There are certainly many pros and cons for both solutions. But I am convinced it would work either way.

Mr. WEISL. You wouldn't want a lot of committees to work with that agency?

Dr. VON BRAUN. No; no committees. [Laughter.]

The basic suggestion would be as follows: Under this concept, the National Space Agency would not handle the ICBM projects and the IRBM projects. These would remain in the services where they are now. The Space Agency would be told, "Your job is to get a man, on a returnable basis, into an orbit in 5 years," shall we say, "and you will build a space station in 10. Here is your own money. You can use the same industrial structure that supports the IRBM and ICBM and other projects, but the head of the Space Agency will make certain that he coordinates his contracts with the heads of the military missile agencies of the services." In other words he would have to sit down with General Schriever, General Medaris, and Admiral Raburn. I think in most areas agreement on noninterference between the missile and the space programs will be much easier reached than is widely believed today, because it simply is not true that our entire missile and rocket development capacity is completely loaded. This is because of those unavoidable peaks and valleys in any such effort.

I would say the situation is in a way, comparable to what we have today with our jet airliners. You are probably familiar with the Boeing 707 jet tanker which was developed with Air Force funds and the fact that Boeing now plans to sell this same basic aircraft as a jet airliner. They have submitted sales offers for the 707 not only to United States airlines, but even to foreign-flag carriers, and they have accepted contracts from them.

Now, there is a very desirable leveling effect in this kind of a thing.

Suppose, for example, the Swissair Lines wants to buy a few 707's, and they sit together with the Boeing people. Boeing will first have to look at their commitments and obligations toward the Air Force with respect to deliveries of 707 tankers. Next they have to look at their previous delivery obligations to other commercial carriers. And only at the end of all this can they tell the Swissair Lines, "We can take delivery on your order only early in 1961."

If the Swiss then don't like it, they go to Douglas and buy DC-8's

This is what I meant with the desirable load leveling effect by providing another sales outlet.

I think the Space Agency could very well assume the equalizing role of the commercial airlines, so to speak. In dealing with the same industrial resources that are engaged in the ICBM and IRBM programs, industry would get all the contracts out of the Space Agency they could handle—and no more. They would be kept on an even keel and everybody would have his fair share in such a space effort. At the same time such sudden crises as have arisen, for example, at North American Aviation with the cutoff of the Navaho project, could very easily be weathered. Because the Space Agency would now walk right in there and say, "We understand you just lost the Air Force Navaho contract. You are probably available for us now."

Mr. WEISL. Dr. von Braun, in order to project a satellite of sufficient weight and size in orbit, we must have an engine or a cluster of engines with a tremendous thrust, and as you and General Medaris previously testified, we have no such engine. And you have recommended that such an engine be developed.

Dr. VON BRAUN. Yes, sir.

Mr. WEISL. And you believe the Russians have such an engine?

Dr. VON BRAUN. Yes, powerful rocket engines are a basic requirement for the conquest of space. We have pretty sound proof that the Russians have, in single units, engines that are many times stronger than the most powerful engine we have in this country, and that they have an even more powerful engine under active development.

Mr. WEISL. And we also know that the Russians have spent considerable time and pooled considerable technological and scientific effort in their race to control outer space.

Dr. VON BRAUN. Yes, sir.

As I mentioned before, I am convinced their concept is a very, very broad one, and that they really consider the control of outer space just as important to them as, shall we say, the Spanish considered the control of the seas in the 16th century.

Mr. WEISL. This is no secret, Dr. von Braun, because it has been published and republished.

Dr. VON BRAUN. Yes.

Mr. WEISL. Both in Russia and the United States.

Dr. VON BRAUN. Yes.

Mr. WEISL. Are you familiar with the Rand report?

Dr. VON BRAUN. Yes, sir.

RAND REPORT ON RUSSIAN OUTER SPACE EFFORT

Mr. WEISL. The Rand Corporation is an affiliate of the United States Air Force, and they have published a book which you no doubt

have seen, showing the effort, showing the great amount of energy and proportion of their resources that the Russians are using to control outer space.

In fact, in this very book that you have seen, the Rand project compiled from translated Russian literature, showed when they would put the sputnik in orbit, and I would like to put the Rand project in evidence, Mr. Chairman.

Senator JOHNSON. Without objection, the United States Air Force Project Rand Research Memorandum will be placed in the record.

Mr. WEISL. It is unclassified.

(The report referred to follows:)

INTRODUCTION

PRELUDE TO SOVIET SPACE FLIGHT

The announcement by the Soviets in June 1954 of the inauguration in the Soviet Union of the "world's first" nuclear power station was preceded by an accelerating flood of newspaper and magazine articles on the various aspects of nuclear energy—especially the peaceful applications thereof. In a strikingly similar manner the recent¹ announcement by the U. S. S. R. of its intention to launch several artificial earth satellites in polar orbits—the high point of the advent of the International Geophysical Year—was preceded by a plethora of articles on space flight in the Soviet press.

The signal to begin wide-scale publication of articles and books on space flight ostensibly was the assertion by Academician A. N. Nesmeyanov, president of the U. S. S. R. Academy of Sciences, before the World Peace Council in Vienna on November 27, 1953, that "Science has reached a state when it is feasible to send a stratoplane to the moon, to create an artificial satellite of the earth." Translations of some of these articles are available in RAND Research Memorandum RM-1760: A Casebook on Soviet Astronautics (pt. I of the present study). Other then stressing the work of the early Russian astronauts—Tsiolkovskii, Tsander, and Kondratyuk—all of whom died in the mid-1930's, and occasionally discussing a radio telecontrolled tankette-laboratory project for lunar exploration, these articles failed to reveal any significant Soviet developments in this field.

Official interest in space flight was revealed by the fact that on September 24, 1954, the Presidium of the U. S. S. R. Academy of Sciences established the K. E. Tsiolkovskii gold medal for outstanding work in the field of interplanetary communications to be awarded every 3 years beginning with 1957. Shortly thereafter the Presidium established a permanent interdepartmental Commission on Interplanetary Communications to "coordinate and direct all work concerned with solving the problem of mastering cosmic space." Academician L. I. Sedov, a topnotch hydrodynamicist, was appointed chairman, and M. K. Tikhonravov—who designed and successfully launched liquid propellant atmospheric research rockets in 1934—was appointed vice chairman.

In August 1955, the Soviet Union was represented by two observer-delegates—Academician L. I. Sedov and K. F. Ogorodnikov, an English-speaking professor of astronomy at the Leningrad State University—at the Sixth International Astronautical Congress in Copenhagen, Denmark. In 1956 the U. S. S. R. Academy of Sciences applied for membership in the International Astronautical Federation. The application was voted on favorably during the Seventh International Astronautical Congress in Rome in September 1956. Moreover, the Soviet Union's lone observer-delegate to that Congress—L. I. Sedov—was elected a vice president of the IAF.

Up to this time the official Soviet position with regard to its activities in the field of astronautics was one of extreme reticence. The myriad articles on the problems of space flight that appeared in the popular press presented, for the most part, well-known information from the western press with only occasional broad hints as to native developments in the Soviet Union. Soviet technical journals, however, continued—as they had in the past—to present from time to time articles of considerable interest and merit, especially in the fields of flight mechanics and hydrodynamics.

Soviet uncommunicativeness ended in December 1956, when a delegation of 13 scientists, headed by Academician A. A. Blagonravov, an armaments specialist

¹ See appendix XVI.

and a member of the Presidium of the Academy of Sciences, attended the First International Congress on Rockets and Guided Missiles in Paris, France. There the Russians presented two papers which revealed the prodigality of the Soviet rocket test program by the use of an experimental technique in which the measuring instruments are not carried in the rocket itself, but in automatically jettisoned containers, the results being recorded on film and the containers recovered by parachute. The papers were entitled, "Study of the Upper Atmosphere by means of Rockets at the U. S. S. R. Academy of Sciences," by S. M. Poloskov and B. A. Mirtov, and "Study of the Vital Activity of Animals during Rocket Flights into the Upper Atmosphere," by A. V. Pokrovskii, director of the U. S. S. R. Institute of Experimental Aeromedicine. (For translations of these papers see appendixes XI and XII.)

Figure 1 is a sketch—based on a newspaper photograph—of an instrument container 2 meters long and 0.4 meter in diameter used for upper atmospheric research. It is essentially a metal cylinder divided into three sections. The lower section is hermetically sealed and contains power supplies, ammeters, camera, and the program mechanism which controls the operation of all the instruments in the container. The center section—which is open to the atmosphere—contains evacuated glass sampling flasks, thermal and ionization gages, etc. The upper section contains a parachute and is also hermetically sealed. The bottom of the container is equipped with a set of spikes to ensure a vertical landing. The container, which weighs about 250 kilograms, is jettisoned automatically in the descending phase of the trajectory at a height of 10 to 12 kilometers above the earth's surface.

Figure 2 is a sketch of a catapultable chassis used in studying the behavior of dogs during round-trip flights to altitudes of 110 kilometers. The dog is secured in a hermetically sealed space suit with a removable plastic helmet and is provided with a 2-hour supply of oxygen. The chassis is equipped with radio transmitter, oscillograph, thermometers, sphygmometer, camera, and parachute. Two such chassis are fitted in the rocket nose section which separates from the body of the rocket at the apex of the trajectory. One chassis separates from the nose section at a height of 80 to 90 kilometers and parachutes to the ground from a height of 75 to 85 kilometers. The other chassis separates from the nose section at a height of 45 to 50 kilometers, and falls freely to a height of 3 to 4 kilometers before parachuting to the ground.

As one might expect, the subject matter of these two papers has received extremely wide publicity in the Soviet press. Probably the most comprehensive review was given by Academician Blagonravov himself in an article entitled "Investigation of the Upper Layers of the Atmosphere by Means of High-Altitude Rockets," *Vestnik Akademii Nauk SSSR*, June 1957.² Besides mentioning by name the key personnel in the program, Blagonravov states that cosmic ray investigations by means of rockets began in the Soviet Union in 1947, that atmospheric composition studies to altitudes of 100 kilometers began in 1949, and that systematic studies of the atmosphere—including the use of dogs—were conducted from 1951 to 1956.

By way of interlude, a Tass dispatch datelined Moscow, June 18, 1957, reads as follows:

"At a press conference held by the State Committee for Cultural Relations with Foreign Countries on June 18, the correspondents were shown living travelers into extraterrestrial space—3 dogs who were sent up in rockets to a height of 100 kilometers and more. Two of them have made two flights each and are in good health. All the flights were filmed. It was found that the animals behaved normally when flying to this height at a speed of 1,170 meters per second. Alexei Pokrovskii, a member of the Soviet Committee for the International Geophysical Year, said: 'I would like the British correspondents to inform the British Society of Happy Dogs about this because the society had protested to the Soviet Union against such experiments.'"

Several interesting studies, reflecting various degrees of originality, have appeared recently in the Russian popular scientific literature. One is the idea of worldwide television broadcasting by means of 3 earth satellites symmetrically spaced in an equatorial orbit at an altitude of 35,800 kilometers (appendix IV). Another is the use of earth satellites for the experimental verification of the general theory of relativity (appendix VI). The study of the biological problems of interplanetary flight continues to be the subject of considerable discussion and investigation (appendixes V and IX).

² Vol. 27, No. 6, pp. 25-32.

FIGURE 1.—Instrument container used in Soviet atmospheric rocket research.

FIGURE 2.—Catapultable chassis used in study of canine behavior in rocket flight.

Russians technical literature—as inspection of the bibliographies in both parts of this Casebook clearly indicates—contains a wealth of evidence of native competence in the various theoretical aspects of rocketry and space flight. Such items as the Proceedings of the All-Union Conference on the Study of the Stratosphere March 31 to April 6, 1934 and the collections of papers entitled *Raketnaya Tekhnika* (Rocket Technology) and *Reaktivnoe Dvizhenie* (Jet Propulsion), published in 1935 and 1936, clearly indicate that the Russians possessed a relatively high degree of technical sophistication more than 2 decades ago. It is interesting to note that several of the investigators who contributed to those early publications are active today in the field of rocket propulsion and space flight.

Recent Russian technical literature gives abundant evidence of continued progress in the various disciplines associated with space flight. Not the least is the publication a few years ago of tables of thermodynamic properties from 298° K. to 5,000° K. of such chemical species as F_2 , HF, CH, CH_2 , CH_3 , and C_2 . The first 2 indicate an interest in fluorine as an oxidant in rocket propellant systems, and the latter 4 an interest in hydrocarbons as possible propellents in nuclear rockets.

In celebrating its 125th anniversary in 1955, the Moscow Higher Technical College, otherwise known as the Bauman Institute, published a collection of 19 papers on theoretical mechanics, several of which had direct applications to space flight. One of these is particularly relevant and is entitled "Calculation of the optimum trajectory for the transition of a rocket to a given circular trajectory around the earth," by V. F. Krotov.

In February 1956, a conference on the problems of the physics of the moon and the planets was held in the astronomical observatory of the Leningrad State University. More than 50 scientists participated. The two principal topics for discussion were (1) the questions of planetology connected with the problems of astronautics, and primarily, the question of the state of the moon's surface, and (2) the exchange of opinions and plans for observations of the coming great opposition of Mars in September, 1956. Prof. N. P. Barabashev, conference chairman and director of the Khar'kov University Observatory, pointed out that the importance of planetology is growing substantially in connection with the demands of cosmonautics and that at the same time the responsibility of planetary, and especially of lunar, investigators is increasing. M. K. Tikhonravov, vice chairman of the Commission on Interplanetary Communications, enumerated the basic questions the answers to which astronauts expect from the science of planetology.

Under the caption "Cosmic Boomerang" (appendix XIII), the Soviet press recently gave considerable notoriety to a space flight project headed by Prof. G. A. Chebotarev at the Institute of Theoretical Astronomy in Leningrad. According to Chebotarev's calculations it is possible with the expenditure of only 16 tons of propellant to launch a rocket vehicle weighing 50 to 100 kilograms with an initial velocity of 11 kilometers per second in an elliptical orbit around the moon. Flying solely under gravitational forces the vehicle would round the moon at a distance of 30,000 kilometers and return to the earth in 236 hours after covering a total path length of about 1 million kilometers.

The most recent and probably most startling disclosure in connection with Soviet space flight activities is a paper entitled "Some Questions on the Dynamics of Flight to the Moon" by V. A. Egorov of the Steklov Mathematics Institute in Moscow (appendix XIV). It appeared in the journal *Doklady Akademii Nauk SSSR*, March 1, 1957. The paper is a 4-page summary of a systematic investigation undertaken from 1953 to 1955 to find satisfactory solutions for the fundamental problems in the theory of flight to the moon: specifically, the form and classification of unpowered trajectories, the possibility of circumflight of the moon with return to the earth, the possibility of periodic circumflight of the moon and the earth, the problem of hitting the moon, and also the particularly important question of the effect of the dispersion of initial data on the realization of hitting or circumflight. More than 600 trajectories were calculated by means of electronic computers and were classified as hits, circumflights or afflights, i. e., approach trajectories which do not encompass the moon but allow one to see everything on its opposite side and to return to the earth. This investigation is quite similar to studies of the general trajectories of a body in the earth-moon system that are being conducted in this country. The general results of the studies are in substantial agreement. Unfortunately, however, specific numerical comparisons are not feasible because of the paucity of data in the Russian article.

The red-letter date on the Soviet astronomical calendar is September 17, 1957. This is the 100th anniversary of the birth of K. E. Tsiolkovskii, the founder of the science of astronautics. Though it comes rather early in the current International Geophysical Year, there could be no more fitting way of celebrating this occasion—

from the Russian point of view—than to establish the first artificial earth satellite in honor of Konstantin Eduardovich Tsiolkovskii.

That this is a distinct possibility is borne out by a combination of two factors: (1) the announced intention of the Soviet Union to launch several earth satellites in polar orbits during the IGY (one must remember that by its very nature a polar orbit launching is a considerably more ambitious task than an equatorial orbit launching), and (2) the postponement of the launching date of the Project Vanguard vehicle until late 1957 or early 1958. The prestige and propaganda value to be gained from a premier launching of an earth satellite, whether instrumented or not, undoubtedly present a circumstance far too attractive for the opportunists in the Kremlin to ignore.

Dr. VON BRAUN. Mr. Weisl, I was not quite finished with my proposal on the National Space Agency, if I may just finish this.

Mr. WEISL. Please continue, Doctor.

Dr. VON BRAUN. So far I have mentioned only the vehicle aspect of this program. I said if this Agency would be supplied with sufficient funds, I was convinced that it could use the same resources that are presently used for the ICBM, the IRBM, and other programs, without undue interference with those programs. I said that in fact it would even have a very beneficial effect on those programs because it would tend to stabilize the development teams. For these teams could take over part assignments in the space program whenever they were confronted with a temporary reduction in their workload, for instance because of a cancellation or because they are over the hump with one development program and have not yet picked up a new one.

Now in addition to this rocket-vehicle program which represents, so to speak, the transportation angle, or the industrial phase of the conquest of space, there is of course much pure and applied research involved in this outer space business, too.

For example, the outer space physical research program which is presently going on under the auspices of the IGY, should most certainly be continued after the IGY is over. But right now there is no agency in this country which is really responsible for its continuation.

Right now this program is in the hands of the National Committee for the IGY, but under the charter of that Committee it will be dissolved on the 31st of December 1958.

The continuation of this research program would, in my opinion, be a logical assignment to the National Space Agency.

Senator SALTONSTALL. Mr. Counsel, I would appreciate it very much if you would ask Dr. von Braun to repeat the first part of that.

What is this that is going to continue beyond the geophysical year? I did not get that.

Mr. WEISL. IGY?

IGY EFFORT COULD BE INCORPORATED IN SPACE AGENCY

Dr. VON BRAUN. Under the auspices of the International Geophysical Year, the United States has agreed to conduct a certain amount of environmental research with satellite rockets. This means instrumentation will be put into the satellites and the information on the physical environment in outer space will be radioed down to the ground.

Now this program is presently administered by the United States National Committee for the International Geophysical Year, which will go out of business on the 31st of December 1958. I think this

IGY space research program is only the humble beginning of much more to come, if we are to conquer space. So there ought to be some agency under which this kind of investigations are being continued.

Senator SALTONSTALL. Mr. Chairman, with your permission might I ask a question?

Senator JOHNSON. Senator Saltonstall.

Senator SALTONSTALL. What you are saying is, you believe there is value in continuing this National Committee or some part of it on a national program rather than on an IGY, International Geophysical Year, program.

Dr. VON BRAUN. Sir, what I was suggesting was to incorporate this whole effort into the National Space Agency which I am proposing here.

Senator SALTONSTALL. I see. Thank you.

Dr. VON BRAUN. As a logical part of their assignment.

Senator JOHNSON. He suggested the National Space Agency and he says he is now giving us things that ought to go into this Agency. One thing is the research being conducted by IGY on space exploration. He would have it go into this Agency.

Senator SALTONSTALL. Thank you.

Dr. VON BRAUN. There is another area: Space medical research is presently being conducted at 2 Air Force bases; namely, Randolph Field, Tex., and Wright Field, Ohio, and at 2 Navy bases; namely, Pensacola, Fla., and Johnsville, Pa.

All this effort is necessary and in competent hands, but I think it would be much more efficient if the entire space medical research program would be transferred to the National Space Agency which would then also conduct, for example, animal experiments with orbiters, et cetera.

Space reconnaissance and communications satellites is another logical assignment to the National Space Agency.

I mentioned already the reconnaissance potentialities of satellites, but there are still other possibilities.

For example, a satellite can be used as the most efficient communications carrier that has ever been invented.

If you combine modern techniques of high-speed coding, as we use them in electronic digital computers today, with modern broadband-width tape recorders you have a machine which is capable of printing the contents of an entire book on a magnetic tape within a matter of 2 or 3 seconds.

Now suppose you have a satellite equipped with such a multichannel tape recorder, and you have a ground station which can flash messages up to the satellite. When the satellite, shall we say, passes over Chicago, it takes on all the messages Chicago has for Washington. Five minutes later the satellite passes over Washington and plays the messages for Washington back, clears the tape, and takes on messages Washington may have for, say, Capetown, et cetera.

Mr. WEISL. Do you think Washington could get a message that quickly? [Laughter.]

COULD HANDLE ENTIRE MAIL VOLUME OF EARTH

Dr. VON BRAUN. The storage capacity of such satellites using these modern coding techniques is downright astronomical. We have calculated that you can handle the entire mail volume of the entire

earth, and still have plenty to spare, with about six satellites working in a compound system.

I think if you gentlemen are interested in revenue, just charge one penny a word for this kind of mail service, and this thing could really make money for itself.

I am merely mentioning this as another aspect of the coming space age.

I just feel this kind of thing obviously does not belong in the Navy or the Air Force or the Army. It is a development of an entirely new technology, and it will probably put all the post offices all over the world out of business sooner or later.

Mr. WEISL. Doctor, could weather be affected by the satellite?

Dr. VON BRAUN. Absolutely. I am convinced there can be no better and more reliable weather forecasting service than from a satellite, particularly from manned satellites.

Right now one of the greatest difficulties in weather forecasting is that nobody knows exactly what the total cloud coverage of the earth is at each instant.

This is one piece of information that you can gather within 1 second by taking a photograph of the earth from an orbiter.

Mr. WEISL. Could storms and hurricanes be prevented?

Dr. VON BRAUN. I would not say prevented, but they can certainly be predicted with a very great accuracy.

But the combination of satellite weather surveillance methods and earthbound weather influencing methods, such as rain seeding and paint dusting of snowfields, could most certainly provide an effective combination of weather forecasting and weathermaking.

I would also like to mention that as a result of our—

Mr. WEISL. Tell us a little more, please, Dr. von Braun, about weathermaking.

Dr. VON BRAUN. I am not an expert on meteorology, but I think several methods in influencing weather are presently already in practical use. Rain seeding is one of them. I think studies are underway to influence the course of hurricanes.

Senator SALTONSTALL. What is that word?

Dr. VON BRAUN. Rain seeding, seeding of rain. You send an airplane over the clouds and seed particles into the clouds in order to make the clouds precipitate the humidity they collect.

Senator SALTONSTALL. Thank you.

Dr. VON BRAUN. Finally, there is one more logical area of activity for a National Space Agency. When the IGY will be over by the end of 1958, the earth will be covered with a great number of optical and electronic observation stations which were part of the satellite Moonwatch program, or part of the so-called minitrack and microlock picket line consisting of radio receiver stations for the tracking of satellites.

Now, it would appear to be highly desirable to continue to operate this international network of observation stations. This is not limited to the United States, of course, because an orbiter goes around the earth. So, tracking of satellites is, of necessity, an international effort.

I think the National Space Agency would be the most natural and logical choice to continue to represent the United States in all international matters arising out of this outer-space program—such as

the operation of such tracking stations or the acquisition of landing rights for returning space vehicles in other countries, et cetera.

So, my recommendation would be, if I may recapitulate it once more, that the ICBM and IRBM programs remain in the services, if for no other reason than not to rock the boat at this critical time; but that, for the purpose of conquering outer space, a new national effort outside of the services be made, and that a separate agency be set up for this.

Right now, there is every evidence that the three services are already "jockeying for position" in the battle for space.

Space is a very fashionable word today, although it was almost taboo in the Pentagon 6 months ago.

Mr. WEISL. What is that?

Dr. von BRAUN. It was taboo.

Senator JOHNSON. Space was taboo in the Pentagon 6 months ago, and today it is a very fashionable word. Go ahead.

Dr. von BRAUN. Everybody tries to get into the act now, but I think it would be very shortsighted to permit things to develop this way. Conquest of space should really be a national effort, rather than a single-service effort.

Mr. WEISL. Have you completed?

Dr. von BRAUN. Yes; I am finished with the proposals.

Mr. WEISL. Thank you very much, Dr. von Braun. Is there anything you would like to add, in connection with some of the questions that I asked, or in other areas?

Dr. von BRAUN. May I go through my papers?

I have one note here that I would like to say a few words about. You asked me about the factors delaying progress in the missile field, and, in this connection, one reads a lot these days about so-called interservice rivalry. I should like to make a few remarks about this particular question.

SERVICES COOPERATE, BUT IRRESPONSIBLE STATEMENTS HURT

It has been our observation at the Army Ballistic Missile Agency that the cooperation between the services themselves has always been excellent. For example, as long as we were associated with the Navy on the Jupiter project (the Jupiter originally was meant to be, also, a ship-based missile), our cooperation was beyond reproach. It was as good and smooth as it possibly could be. Only recently, the Navy recovered the Army-developed experimental nose cone from the ocean.

The same can be said about our cooperation with the Air Force, in particular with the Air Force-operated long-range proving ground in Florida.

The support we get from General Yates is not only beyond reproach, but I would say the fellows down there go out of their way to accommodate our Army test-firing program.

So, in the areas of practical work, the cooperation with the other services is just perfect. Even in the much-debated IRBM application by the Air Force the cooperation is fine. The Air Force assigned to us an Air Force officer by the name of Colonel Erlenbusch, who handles the incorporation of the Jupiter missile project into the Air Force operational scope. This work is proceeding as smoothly as can be.

And yet there are certain areas where I believe something could be done to improve the atmosphere.

By and large, there is good will in the services on both sides, among personnel in uniform and among civilians, but the enthusiasm that exists on both sides is occasionally dampened by some irresponsible statements on the part of some individuals.

For example, we hear all of a sudden that somebody says our Jupiter nose-cone test, I mean the successful reentry and recovery of that nose cone displayed by the President, was nothing but a scientific stunt. Statements like this hurt the cooperation, no matter whether they are made by competitors or by people who just want to muddy the waters.

I think there is a particular area which deserves attention in this regard and that is the trade journals. Certain trade journals publish quite frequently some rather vitriolic articles, taking a very one-sided stand in favor of one of the services. Usually, they have been fed some half-truths by somebody who just wants to hurt his competitor. He couldn't tell the journal the whole story because it is under wraps, but a well-planted half-truth can create an entirely wrong impression and make a very strong case against the other fellow, whom he wants to hurt.

Now, these trade journals, of course, live from advertising bought by the big corporations, and often seem to feel that they owe it to their advertisers to go to bat for them. I think this kind of ill-informed crusading poisons the interservice atmosphere more than anything else. I would say these kind of publications can be rightfully called an active instigation of interservice rivalry. And, if some ways and means could be found to maintain healthy criticism but to, shall we say, make it less attractive for trade journals to indulge in such active instigation of interservice rivalry, I think the country would be rendered a great service.

I do not know whether any such legislation is conceivable and compatible with the concept of the free press, but, if something along these lines could be done, it would help more than all the talk about whether the different uniforms can live together.

Mr. WEISL. Anything else, Doctor?

Dr. VON BRAUN. No, sir; I think I am through.

Mr. WEISL. Thank you very much, Doctor. That is all counsel has to question Dr. von Braun about, Mr. Chairman.

Senator JOHNSON. Dr. von Braun, why do you want to go to the moon?

Dr. VON BRAUN. This is a very fundamental question; it is the question about what motivates research. Recently, I attended a meeting in New York where somebody said basic research is when I am doing something but I don't know what I am doing.

I believe that the economic benefits of any exploratory work, no matter in what field, come only in the wake of the achievement itself. I think no inventor, no explorer, could ever predict exactly what would follow in the train of his deeds. Most certainly, when Columbus discovered America, he found very little here that was worth talking about and he could not possibly have possessed the imagination to predict all the things that developed on the continent he discovered.

I think curiosity, and nothing else, should be the motivating power in exploration and research, and it is just curiosity why I would like to go to the moon.

VISITING MOON TODAY LIKE FLYING IDEA WAS 50 YEARS AGO

Senator JOHNSON. Why do you think it is important that the free world get there first?

Dr. VON BRAUN. Visiting the moon is only part of the overall concept of conquering space, and in my previous testimony I submitted my views on the tremendous military importance of the unchallenged control of outer space. But military and peaceful scientific exploratory efforts usually go hand in hand.

I see a great similarity between the present rush into outer space and the moving forces behind the development of aviation. And your question, sir, "Why do you want to go to the moon?" sounds very much like the question asked of an aviation pioneer 50 years ago: "Why do you want to fly?" Chances are he would have replied: "Because the birds can fly and I cannot, and I just resent the idea that I cannot fly."

Thus, man learned to fly, and out of this basic urge came aviation, and out of aviation came bombers, and out of aviation also came commercial airlines and closer links between peoples and nations, and, thus, our entire modern concept of a worldwide civilization. And I think this mechanism of logic and causality will apply to space vehicles and space exploration in very much the same way. It will simply widen man's area of activities and extend it beyond our planet, to put it in simplest terms.

Senator JOHNSON. Dr. von Braun, in your judgment, will we have a Jupiter squadron ready for overseas by the end of 1958?

Dr. VON BRAUN. Yes, sir. If that check comes soon, I think we will. [Laughter.]

Senator JOHNSON. What would you like to tell the committee about the decision to establish a new Advanced Weapons Agency in the Department of Defense? Do you have any comment to make on that?

Dr. VON BRAUN. Would you kindly repeat your question, sir?

Senator JOHNSON. Would you care to give the committee your opinion of the decision to establish in the Department of Defense an Advanced Weapons Agency?

Dr. VON BRAUN. Mr. Chairman, I am afraid I am not sufficiently familiar with the details of this concept. All I know about it is what I have read in the papers.

Senator JOHNSON. Very well. I will ask you another question. Do you share Mr. Holaday's opinion that we could put a large satellite up any time we wanted to?

Dr. VON BRAUN. I do not know exactly how Mr. Holaday meant his statement. If he meant that we could shoot a big satellite up tomorrow, then my answer is definitely "No." If he meant we could get a program for a real big satellite rolling if we provided the money now, and shoot it up in something like a year or 2 years from now, then the answer is "Yes."

Senator JOHNSON. You think we have the ultimate capability, but it is far down the road?

Dr. VON BRAUN. Specifically, we could fire—I am talking now about Army capability—we could fire a few satellites weighing many times the 20-pound weight of the Vanguard or our own Jupiter-C satellites still within the International Geophysical Year, which ends on the 31st of December 1958.

Senator JOHNSON. Did I understand you to say that the carrier sending up Sputnik II, weighing 1,200 pounds, that with that same carrier the Russians could have sent a hydrogen warhead 4,000 to 5,000 miles?

Dr. VON BRAUN. Yes, sir.

Senator JOHNSON. Weighing 4,000 or 5,000 pounds?

Dr. VON BRAUN. Yes, sir.

Senator JOHNSON. You have no doubt about that?

Dr. VON BRAUN. No. This is pretty straightforward. A rocket that can orbit a load of, say, a thousand pounds, can throw approximately 3,000 pounds over an intercontinental distance.

Senator JOHNSON. If they chose to and they had the hydrogen warhead, the same carrier that put the dog up there can put a hydrogen bomb on top of the Capitol?

Dr. VON BRAUN. It is a question of whether it would hit. This, I do not know. On the other hand, I think we should not underestimate their capability in regard to guidance systems.

Senator JOHNSON. We generally do, though, do we not?

Dr. VON BRAUN. Pardon me?

Senator JOHNSON. We generally do underestimate them, do we not?

Dr. VON BRAUN. Yes, sir; and I would say the orbits of the sputniks indicate they have a very remarkable demonstrated capability in the guidance area, also. Otherwise, they would not have succeeded putting those orbiters up there.

Senator JOHNSON. So, if you had to speculate, your answer would be, "Yes; they could put a hydrogen warhead on the city of Washington"?

Dr. VON BRAUN. I would think so; yes, sir.

Senator JOHNSON. Have you seen the Gaither report, Doctor?

Dr. VON BRAUN. No, sir.

Senator JOHNSON. Doctor, in your opinion, has the United States made better use of the German scientists than Russia did?

Dr. VON BRAUN. I am very happy with the assignments I have been given in this country, and I am very proud that I could make some contribution in this field so vital to our security.

Senator JOHNSON. We are very happy to have you. But, from what you know about the general situation existing in both countries, do you think that we have fully utilized the ability of the German scientists who came here to a greater extent than Russia has?

Dr. VON BRAUN. Yes, sir; very definitely, yes.

Senator JOHNSON. I gathered that was your testimony. Do you think they could have been better utilized than they have been?

Dr. VON BRAUN. No; I would say—

Senator JOHNSON. If you had got that check.

Dr. VON BRAUN. I would say during the first 5 years after the war, we were not too busy; but after all these crash programs—

Senator JOHNSON. You got time to get acclimated.

Dr. VON BRAUN. Yes, sir.

Senator JOHNSON. Are you too busy now?

Dr. VON BRAUN. Yes, sir.

Senator JOHNSON. Is there anybody in a hurry down where you work?

Dr. VON BRAUN. Very much so, sir.

Senator JOHNSON. That is good news. Have they been getting around any faster in the last 60 days since Sputnik I and Sputnik II? Did it kind of step things up a little, speed them up?

MORALE UPLIFTED AT REDSTONE

Dr. VON BRAUN. I'd say one thing has profoundly changed, and that is the atmosphere in which we work. During the months before sputnik, our entire organization was, for several months, I would say since early 1957, under the constant threat of sudden extinction. We heard, time and again, that since the Air Force was charged with the "roles and missions," in the IRBM field, they would never concede that there was a need for the Jupiter, and so many people thought we would soon go out of business. It is, of course, very difficult to fan enthusiasm, to build up a team and retain esprit de corps in a team, and to persuade people not to take higher paying jobs in industry, when you are told repeatedly that what you are doing is not even needed.

This has abruptly changed with sputnik. I would say on the very same day. We now know that we are here to stay, and that there is probably work enough for all of us, for all our guided-missile teams in this country. But, as I said, the mills in the Pentagon are grinding slowly, and we hope that the good will is followed up with a check sooner or later. [Laughter.]

Senator JOHNSON. I quite agree with you that it is nothing short of disgraceful that you would get an order to go full steam ahead and then General Medaris would have to pull a sleight of hand stunt in the dark of the moon and go over to some other agency to get some money that did not belong to him in order to finance the order that you have gotten. And I hope that as a result of the hearings and the testimony that was brought out here, that the Government of the United States will supply the money that is necessary to carry out the order issued.

Dr. von Braun, did you hear the recommendations that were made by the scientists and manufacturers to this committee as related by the counsel, these six recommendations that seemed to be contained in most of the recommendations made by scientists and manufacturers?

I will read them quickly and then I would like to have any comments you would care to make on them.

First, the United States urgently needs to bring its missile satellite space program under an independent civilian commission.

Do you agree with that?

Dr. VON BRAUN. Well, sir, that might be a little radical. We may run into plenty of static with the services there. In principle, and as a long-range solution, I like the idea. But I think there is a question whether the proposal might not be too radical, and whether a solution limiting this new agency only to the space program and leaving the big missiles in the services would not also work. It would not rock the boat so much at this critical moment.

I would say I would still like to listen and hear what the services have to say to that proposal. If the services buy it, then it might be a good idea. It would certainly be the ideal solution had it been done 2 years ago. I think the question is simply whether today things have not advanced to the point that such a drastic reorganization would cause so much upheaval and new delays that it may hurt our immediate objectives in the ICBM and IRBM programs.

Senator JOHNSON. You do think we need central authority on missile satellite space programs? The question of whether it is independent or service would have to await further testimony and evaluation of it?

Dr. VON BRAUN. Sir, I would put it this way: We have an active missile program today, but we do not have an active space program today. Therefore, if you set up something new for the space program alone, there could be very little interference simply because nothing else exists—despite the fact that these days everybody is trying to stake out a claim in that area.

Senator JOHNSON. With the space program as you suggest, leave the missile program where it is?

Dr. VON BRAUN. That is what I would suggest.

Senator JOHNSON. Then the next recommendation, I guess you would agree with, that there is a need for permanent, competent and adequate staff in the Department of Defense to provide leadership to basic and applied research? You would agree with that?

Dr. VON BRAUN. Yes, sir.

Senator JOHNSON. And to make some decisions?

Dr. VON BRAUN. Yes, sir. And may I come back once more to No. 1. I would definitely say if the services can agree to No. 1, then I would be all for it, too. I am just a little bit skeptical about the possibility of delays in our immediate missile objectives.

Senator JOHNSON. You agree with No. 1, the modification. You agree with No. 2. Let us take No. 3. I do not want to rush you, but I have only a limited time. My colleagues want to ask you some questions because your testimony has been quite interesting and exciting and I know they want to ask some questions in their own right.

The research and development program should be on a 3- to 5-year basis instead of an annual basis so that there could be proper planning.

Dr. VON BRAUN. Yes, definitely.

Senator JOHNSON. Fourth, contractors should have more leeway to plan technical decisions.

Dr. VON BRAUN. Yes, sir.

Senator JOHNSON. Five, reduce lead time by making early and firm decisions.

Dr. VON BRAUN. Yes, definitely.

Senator JOHNSON. Sixth, eliminate all overtime restrictions.

Dr. VON BRAUN. Yes, sir.

Senator JOHNSON. So you could enthusiastically agree with all of them except a question mark on No. 1?

Dr. VON BRAUN. Yes, sir. And I would enthusiastically agree with No. 1 also, provided the services can be made to agree to them, too. I think if the proposal runs into too much static it may be advisable to move a little more slowly toward the ultimate objective and take the existing ICBM and IRBM programs—because of their present urgency—out of this plan, at least temporarily, and incorporate them at some later time into the same overall agency.

Senator JOHNSON. We have got a little statement down in the hills where I come from, Texas, you have heard of Texas, haven't you?

You don't think the Russians have been controlling the weather down there, do you?

Dr. VON BRAUN. In Texas?

Senator JOHNSON: We have had 7 years of drought and now we have had 2 years of floods and we have been worried about it but we have a saying down there, put your money where your mouth is.

So you think when the Pentagon issues an order it ought to accompany it with a check.

You could make that a recommendation, would you? [Laughter.]

Dr. VON BRAUN. Yes.

Senator JOHNSON. Thank you very much, Doctor.

Senator SALTONSTALL?

Senator SALTONSTALL. Thank you.

Doctor, just about 1 or 2 questions.

First let me say I certainly am glad too, you are an American citizen and wanted to become one.

Dr. VON BRAUN. Thank you.

Senator SALTONSTALL. And I am confident you have been of great assistance to us in these programs, Doctor.

Dr. VON BRAUN. Thank you.

Senator SALTONSTALL. Now following up what the chairman has just said and asked you concerning that No. 1 problem, because that interests me and I think it is very important.

We had a lot of testimony yesterday and the other days about having one man and one authority and the ability to make decisions, that is what you want and to follow them up, isn't it?

Dr. VON BRAUN. Yes, sir.

Senator SALTONSTALL. What is not clear in my mind is this:

If we have research and development in the space program separately, as you have been discussing it, will there not be a certain amount of duplication or contradiction of efforts between that and the missile program, so that for the time being at least, until we get going, it might be better to have one authority who was responsible for seeing that action was taken in both those programs?

Dr. VON BRAUN. Well, sir—

Senator SALTONSTALL. Or is that too much business for one to have; so much business that he can't do it all?

Dr. VON BRAUN. No, sir, I am certain one man could do it all.

The only difficulty is, one portion of that program, the missiles, is already a going concern while the other portion is a necessary new program. It will cause quite a little bit of disruption in existing arrangements in the missile business if you put everything under a new head at this late stage in the game.

Senator SALTONSTALL. That is my own feeling, and my own feeling has been if we are going to get action, if we are going to have authority that is going to bring action quickly, and get you your check promptly, that it would be wiser to have one man at the head of both of these programs for the time being, at least.

Is that—do you agree with that or do you not?

Dr. VON BRAUN. Sir, I look at it a bit as follows:

I consider the present missile-development plants as contractors very much like, shall we say, in the field of aviation the aircraft plants develop and manufacture new airplanes.

Now, very much like an aircraft plant can sell airplanes to the Air Force, the Navy, and to the commercial airlines, a missile contractor could sell his missiles for military use to the Air Force or the Army and at the same time sell complete rocket vehicles or components for rocket vehicles to a space agency.

Senator SALTONSTALL. In other words, you think there should be one authority or one man on top of both programs for the time being?

He would be on top of the space agency, and he would be on top of the missile agency.

Dr. VON BRAUN. My suggestion was one man on top of the new space agency and leave the missiles where they are now, in the services.

In otherwords, in the missile field there would continue to be one top man in the Air Force, one in the Army, one in the Navy.

Senator SALTONSTALL. Then you would take the space agency completely out of the military if the military agreed to it?

SPACE AGENCY WOULD BE OUT OF SERVICES

Dr. VON BRAUN. At least out of the services. Preferably, even out of the Department of Defense but most certainly out of the services. Either directly under the Secretary of Defense or preferably directly under the President.

Senator SALTONSTALL. So that you would set up an agency, we will say, like the Atomic Energy Commission?

Dr. VON BRAUN. That is right.

Senator SALTONSTALL. Thank you.

Dr. VON BRAUN. Yes, sir.

Senator SALTONSTALL. Now my other question is this, and I think you have made the problem perfectly clear:

You agree with what Dr. Teller told us that impressed me very much, that back in 1945 and up to 1950 we were not willing to take the risk of going ahead with this ballistic missile because we did not have the warhead to go on top of it, and what we have got to do is go ahead and take these risks, if we are going to keep up with the Russian competition.

Dr. VON BRAUN. Yes, sir.

Senator SALTONSTALL. And then possibly have some of them thrown out and others of them develop into what we want, and so for that reason you say let's go ahead and develop an engine today with a—I think you said a million horsepower?

Dr. VON BRAUN. A million-pound thrust.

Senator SALTONSTALL. A million-pound thrust, even though we don't even know what we are necessarily going to put on top of it at the moment?

Dr. VON BRAUN. Yes, sir. More specifically, I would recommend one smaller one, maybe of 400,000 pound thrust and one bigger one, of 1 million pound.

Senator SALTONSTALL. Well, I appreciate your answers, and Dr. von Braun, you are the technical leader of this project at Redstone?

Dr. VON BRAUN. Yes, sir.

Senator SALTONSTALL. And you are going to go ahead and do your utmost down there at that project, whether the check comes today or whether it comes in the full amount tomorrow or half the amount, you are going to keep on doing your very best?

Dr. VON BRAUN. Yes, we will, Senator.

Senator SALTONSTALL. And you are used to frustrations and contradictory orders in Germany before you came here and now in your own country here in the United States and that is not going to faze you?

Dr. VON BRAUN. No; I spent the better years of my life in missile crash programs so I am used to this.

Senator SALTONSTALL. And you are going to keep her rolling and not get discouraged?

Dr. VON BRAUN. Yes, sir.

Senator SALTONSTALL. Thank you.

Senator STENNIS (presiding). Doctor, you certainly have covered more than I can digest, and I do not have any additional questions, but I want to especially thank you for your very fine contribution here.

Dr. VON BRAUN. Thank you, sir.

Senator STENNIS. And the splendid work that I know you are doing and will continue to do.

I think your testimony has been very valuable to the committee, and will be very valuable to the Nation.

Dr. VON BRAUN. Thank you, Senator.

Senator STENNIS. Senator Flanders?

Senator FLANDERS. Dr. von Braun, you stated, if I remember correctly, that you joined the rocket site at the age of 18.

Dr. VON BRAUN. Yes, sir.

Senator FLANDERS. May I inquire, and this is a personal question, may I inquire whether at that time you were interested in missiles or in space?

Dr. VON BRAUN. At that time in space.

Senator FLANDERS. And you have now come back, you are now coming back to your original interest.

Dr. VON BRAUN. Yes, sir.

Senator FLANDERS. I just want to say, Mr. Chairman, that I do not know when I have had the possibilities of the future opened up as we have had here today in this parallelism between the conquest of the ocean in the conflict between England and Spain, and the conquest of space.

I think the parallelism is close. It expresses the thing which affects the future of mankind. And, as Dr. Teller told us, but with not quite, somehow, the same significance that Dr. von Braun has told us, we have entered a new age, we have entered a space age.

I might also just make one very brief observation:

Your various references to production problems interested me, because I was in the machine tool business for 50 years before I came to the Senate, and it sounded familiar, and it sounded sensible, and I want to compliment the country on having at its service a man whose feet are on the ground and whose head is in space. [Laughter.]

Senator STENNIS. Very good.

I think you made a good statement, Senator Flanders.

Senator Symington?

Senator SYMINGTON. No questions at this time.

WHAT KEEPS IT UP

Senator STENNIS. Doctor, may I ask you one question. Maybe the other members of the committee have already understood this, but I certainly have not, and there may be others in the country who have not.

What makes the satellite stay up? What keeps it on the move?

Dr. VON BRAUN. Well, I can explain that as follows:

Suppose there was a mountain on the earth that was higher than the atmosphere, and you would put a gun on top of that mountain, firing in a horizontal direction; then the shell would travel a certain distance and then fall back on the ground.

Now, as you increase the muzzle velocity, the shell will travel further. If you increase the muzzle velocity even more, the distance traveled will again be greater; and at a certain speed, the curvature of the trajectory in which this shell would fall down to the ground matches the curvature of the earth.

Under this condition, the shell would simply travel around the earth, and it will always fall, but the earth curves away underneath as the thing tries to approach its surface, and so it will keep going and falling around the earth until it will hit the breech of the gun from the rear. You then have an orbit.

The mathematical criterion for this condition is simply that the centrifugal force in that curved trajectory must be equal to the gravitational pull of the earth. If that condition is met the shell goes around in circles.

Senator STENNIS. So it is falling all the time, but it just cannot hit the ground?

Dr. von BRAUN. It is falling all the time, and just can't make it; yes.

Senator STENNIS. It never hits the ground. [Laughter.]

I think you have made a very simple, clear, understandable statement, more so than I had heard.

Are there other questions from counsel or any member of the committee?

Did you have anything further?

Senator SYMINGTON. I might ask 1 or 2 questions of the witness.

Dr. von Braun, you testified last year there were 40,000 people working on the V-2.

Dr. von BRAUN. Yes, sir; including production and everything.

Senator SYMINGTON. How many have you working down at Huntsville?

Dr. von BRAUN. One hundred and twenty former V-2 men. But they were the cream of the crop. Those 40,000 included——

Senator SYMINGTON. How many people, all told, have you down there working on missiles?

Dr. von BRAUN. In my Division, the Development Operations Division of the Army Ballistic Missiles Agency, I have 3,500 people.

Senator SYMINGTON. Thirty-five hundred?

Dr. von BRAUN. Thirty-five hundred; yes, sir.

Senator SYMINGTON. How many are at Chrysler working on it?

Dr. von BRAUN. My figure of 3,500 should not be compared with the 40,000 men on the V-2 program though. Because the equivalent figure would have to include Chrysler and subcontractor personnel, and then, of course, our present personnel figure is much higher.

Senator SYMINGTON. Have you any figure for that?

Dr. von BRAUN. No, sir; but I can furnish you that figure, if you wish.

Senator SYMINGTON. I thought you might have a figure.

What do you think is the next thing the Russians are going to do? What would be your guess?

Dr. VON BRAUN. I believe they will try to shoot at the moon. With their rocket, they can probably carry a 100-pound or 300-pound payload, something like that, to the moon, 1-way.

Senator SYMINGTON. Do you think they might have done it already and missed it coming back?

Dr. VON BRAUN. They may have tried; failed, and said it was a successful ICBM test, I don't know.

Senator SYMINGTON. Would you say that as regards the cone you mentioned we have solved the reentry problem on the IRBM?

Dr. VON BRAUN. Yes, sir; for the IRBM; yes, sir.

Senator SYMINGTON. How about on the ICBM?

Dr. VON BRAUN. The Air Force has a reentry-test vehicle, the so-called Lockheed X17, on which smaller models of the ICBM nose cones have been tested, particularly to study the heat transfer.

These tests, small-scale tests, were apparently successful. Full-scale tests have never been made, simply because there is not an ICBM available yet capable of covering the range with the full payload.

Senator SYMINGTON. Do you think we have the thrust capable now, with any engine that you know of, of throwing up, say, a 1,000-pound satellite?

Dr. VON BRAUN. The ICBM's have a basic capability of orbiting that much, but the vehicles themselves have not been successfully tested yet.

Senator SYMINGTON. I understand that you felt, provided the services approved, you would be for taking ICBM's and IRBM's out of the services and putting them into a new agency?

Dr. VON BRAUN. Sir, I suggested in case this centralized agency runs into too much static, to leave the IRBM's and ICBM's in the services, to limit the task of the centralized agency at first to the space program only, and attach the missile program to it only later. If the services do agree to turn the missiles over right away, however, then it might be a good idea. But I think this is not in my realm to answer, because it is essentially a question of operational use and deployment.

Senator SALTONSTALL. Mr. Chairman——

Senator STENNIS. Will the Senator yield?

Senator SALTONSTALL. I just wanted to ask the Senator if he would clarify the question, because I did not think the doctor's answer was responsive to the Senator's question.

Senator SYMINGTON. I will ask it again.

If the services approved, would you be for taking the IRBM's and ICBM's out of the services and putting them into a new agency?

Dr. VON BRAUN. Yes, sir. Then I would propose to make a space force out of the whole thing.

Senator SYMINGTON. Of course, you would be taking not only the weapons, but the weapons systems, out of the services.

Dr. VON BRAUN. Yes, sir. In this case you have to go all out, do everything.

Senator SYMINGTON. If ultimately the missiles dominated the forces, you would be dissolving the services. Then the Department of Defense would be a Space Department.

Dr. VON BRAUN. Well, sir, I believe that there will always be need for an Air Force, a Navy, and an Army, even if you have absolute space control.

Senator SYMINGTON. But if the predominant weapon in the services is to be missiles, and you take the weapons systems out as well as the weapons, you do not leave much in the way of services, do you, in the way of conduct of our defense, maximum firepower delivered at minimum cost?

Dr. VON BRAUN. Yes. Well——

Senator SYMINGTON. In any case, that is the way you feel about it?

Dr. VON BRAUN. Yes, sir.

Well, but how about fringe warfare, a nonatomic small-scale war breaking out in fringe areas? The space forces, if you want to call them space forces, these space weapons could not be utilized in this kind of war. The space weapon will always be the ultimate, the thing you hope you will never have to use, and that is why I believe there will always be a need for troop airlift and for ships and for Army operations and the capability of policing an area and fighting a local war on a limited scale.

Senator SYMINGTON. And the premise for that thinking would be that you feel that way about anything but all-out war, war which did not utilize nuclear weapons, is that right?

Dr. VON BRAUN. Yes, sir.

Senator SYMINGTON. You have been working in the Army since you came to this country?

Dr. VON BRAUN. Ever since I came to this country; yes, sir.

Senator SYMINGTON. How long have you had full knowledge of the other missile programs in the other services?

Dr. VON BRAUN. Full knowledge since spring 1955, when I became a citizen. I had limited knowledge before that on some projects.

Senator SYMINGTON. Before?

Dr. VON BRAUN. Yes.

Senator SYMINGTON. There are some things we have talked about before, but I think you have explained that, and there is no need to get into it at this time.

The sum and substance of it is that your opinion, after you became a citizen and acquired full information, was radically changed as against the telecast you made on May 8, 1955?

Dr. VON BRAUN. Yes, sir.

Senator SYMINGTON. Is that correct?

Dr. VON BRAUN. Yes, sir; that is correct.

Senator SYMINGTON. I ask one more question, Doctor. May I say you have been a fine witness.

What you have really said in answer to able counsel is that although we have been told the missile programs were speeding up rapidly, they have not been speeded up because the money has not been available; is that correct?

Dr. VON BRAUN. Yes, sir. That goes for the Jupiter production; the Jupiter production, as I said.

Senator SYMINGTON. Well, the Jupiter production is the only ballistic missile program, with the exception of the Redstone, which is inclusive—I believe you call the Redstone “Jupiter-A”, do you not?

Dr. VON BRAUN. Yes, sir.

Senator SYMINGTON. So all you are interested in is Jupiter production, is that correct?

Dr. VON BRAUN. Yes, sir.

Senator SYMINGTON. So as far as what you, yourself, are interested in, whereas to the best of your and my knowledge people have been

told that there is being a big speedup, because of lack of money there has been no speedup; is that correct?

Dr. VON BRAUN. That is correct, sir.

Senator SYMINGTON. Thank you, Mr. Chairman.

Senator STENNIS. Doctor, again we want to thank you for your testimony here and your very valuable contribution here to this form.

Dr. VON BRAUN. Thank you, sir.

Senator STENNIS. If there are no other questions, you are excused now from the witness table. Stay with us as long as you will.

Our next witness will be Dr. William H. Martin.

Dr. Martin, will you come forward, please. Dr. Martin, in keeping with the custom of the committee, will you hold up your right hand and be sworn.

Do you solemnly swear that your testimony here in this committee hearing will be the truth, the whole truth, and nothing but the truth, so help you God?

Mr. MARTIN. I do.

TESTIMONY OF WILLIAM H. MARTIN, DIRECTOR OF RESEARCH AND DEVELOPMENT, DEPARTMENT OF THE ARMY

Senator STENNIS. Dr. Martin, I will insert in the record here a biography.

(The biography referred to is as follows:)

WILLIAM H. MARTIN, DIRECTOR OF RESEARCH AND DEVELOPMENT, DEPARTMENT OF THE ARMY

William H. Martin, appointed Director of Research and Development for the Army effective September 1, 1955, had been Deputy Assistant Secretary of Defense for Applications Engineering since January 1954. Prior to that time, he retired from his previous position as vice president of the Bell Telephone Laboratories. As Director, Mr. Martin reports directly to the Secretary of the Army and has the same degree of responsibility as that given to an Assistant Secretary of the Army. The Director is in charge of all plans, implementation, and financing of research and development projects armywide.

Mr. Martin, a native of Baltimore, Md., received a bachelor of arts degree from Johns Hopkins in 1909; a bachelor of science degree from the Massachusetts Institute of Technology in 1911; and a doctor of science degree from Bethany College in 1956. He joined the engineering department of the American Telephone & Telegraph Co. in 1911 and became a member of the Bell Telephone Laboratories in 1934.

Mr. Martin's experience has been largely in the development, design, and evaluation of new equipment and systems for the communications business, but during and since World War II he was in charge also of similar work on military equipment. For his military work during World War II he was awarded a Presidential Certificate of Merit.

Mr. Martin was born in Baltimore, Md., September 27, 1889, the son of Howard W. and Sallie (Hennick) Martin. He is married to the former Margaret F. Grier, also of Baltimore. They have two children, William G. Martin and Isabel Martin Williams. They were residents of Short Hills, N. J., before coming to Washington.

Mr. Martin is a fellow of the American Institute of Electrical Engineers and of the Acoustical Society of America, a senior member of the Institute of Radio Engineers and a member of Phi Beta Kappa, Theta Xi, the Cosmos Club, and the Army and Navy Club.

Senator STENNIS. We are certainly glad to have you here, sir, and we feel that you will be a valuable witness. Our opening examination will be conducted by the committee counsel.

Mr. WEISL. Dr. Martin, when were you appointed Director of Research and Development in the Army?

Mr. MARTIN. I was appointed September 1, 1955.

Mr. WEISL. And by whom were you appointed?

Mr. MARTIN. By Secretary Brucker.

Mr. WEISL. That was the first month Secretary Brucker was in office?

Mr. MARTIN. As I remember, he was appointed in the latter part of July, about the last week. Within a few weeks of that time, he asked me if I would come and be with him in charge of research and development. I took that position the 1st of September 1955.

Mr. WEISL. Would you be kind enough, Dr. Martin, to elaborate on your responsibilities and your experience in these areas, in order that the committee may fully understand the background against which your remarks are going to be made?

Mr. MARTIN. I have been in research and development work all my life in industry. I started out in 1911 with the American Telephone & Telegraph Co., working there in research and development. In 1934 I became a member of the Bell Telephone Laboratories, a subsidiary company of the Bell System. All that time I was in charge of research and development programs, particularly in developing new equipment for use in the communications business.

During World War II, I was in charge of a large number of important military-weapons programs for the several services, and I had some responsibilities in that field from the termination of the war until I came to Washington.

Mr. WEISL. Dr. Martin, in our investigation of the manufacture of weapons of war, particularly missiles, we find that it takes an average of about 10 years from the time that an idea is conceived to the time that that idea is converted into an operational weapon. Can this time be decreased, in your opinion?

Mr. MARTIN. In my opinion, it can be decreased. Of course, in talking about the missile field of the past, we are talking about a new field in military weapons. In some of our past history we had to form operating organizations, manufacturing organizations. There was considerable time taken in that process. But today I am convinced that this time can be materially reduced.

Mr. WEISL. How would you go about reducing this time?

Mr. MARTIN. I would like to go back to some experiences I have had. I am reminded of an experience I had during World War II, by Dr. Houston, who is sitting just immediately back of you. I worked as a contractor on an important weapon job which you might call one of the first missiles. Dr. Houston represented the Government, and we worked together very closely. On that job we made a record under wartime conditions of going from the initiation of research to the availability for operational use in 17 months.

I have worked on jobs for industry where, by planning the programs and scheduling them, we were able to go from initiation to production in 3 years. I think the job that has been discussed here so much this morning, the Jupiter job, was initiated 2 years ago and will have operational capability in 1 year from this month, according to our program, a total of 3 years. That is an indication that we can do these jobs in less than 10 years.

Mr. WEISL. Now, our investigation indicates that such things as planning, organization of the job, review and decisionmaking, committee advice, funding, questions of management, and many other

things take place before an idea is first put into a design, and these steps sometimes take as much as 5 to 6 years. Then another 5 years are spent from the time when the idea is let out to the manufacturer to the time when the idea becomes an operational weapon.

Now, tell us, Dr. Martin, specifically what you have done and what you are trying to do to shorten that time?

Mr. MARTIN. The first thing in any job of this sort is to make sure that you know what you are trying to do, to have a clear picture what it is you are trying to accomplish, what you want to use it for and why.

Then get that accepted and supported by the management group that you are working for. Following that, in my own experience you want to——

Mr. WEISL. If I may interrupt, Dr. Martin, that is the first step, and that goes, according to the charts we have seen, from one department to another, from one advisory committee to another, and that step alone has taken as much as 1 year to 2 years to get through.

Mr. MARTIN. Yes.

Mr. WEISL. That first step you mentioned.

Mr. MARTIN. I realize——

Mr. WEISL. How can we shorten it, Dr. Martin?

Mr. MARTIN. These things come down to people, people and their competence. If you have the right kind of people who know what they are doing, I think you can get the result much quicker.

Mr. WEISL. But sometimes you get the right kind of people. Dr. von Braun is the right kind of a man. I am sure General Medaris is the right kind of a man, but they have got to go through committees and they have got to go through departments. They have got to go through planning boards.

Now, how can we eliminate that and still be efficient and get things done in time?

Mr. MARTIN. I think we can eliminate it if we get competent people in the management of the jobs.

Mr. WEISL. Do not these competent people have to have authority and responsibility?

Mr. MARTIN. Yes.

Mr. WEISL. And funding authority?

Mr. MARTIN. If you are going to give people management responsibility, you have got to give them authority.

Mr. WEISL. Do they have that now?

Mr. MARTIN. Not to the degree I think they should.

Mr. WEISL. What degree do you recommend that they should have it?

Mr. MARTIN. I would like to put it this way, if I may digress a minute in answering that question. I think we bring up here a fundamental concept of how you manage an operation and how you control it. I think there is a tendency in Washington to try to control the operations by specifying ahead of time what should be done in quite a great bit of detail. This comes in the form of directives, of reviews, of presentations which have to be passed on.

In industry today and a great many years back, there is more of a tendency to control the operations of people by judging their results. As General Medaris mentioned here this morning, if he did not deliver the goods, he ought to be put out and somebody else put in. I think

this is one of the very vital factors in getting at this matter of time. It is what attitude we have from the supervisory standpoint as to how we control the jobs and how we monitor the performance of the people.

Mr. WEISL. I know that is a desired result to obtain, Dr. Martin, but what the committee, I am sure, is trying to find out is how to bring that about? How can we do it? You are in charge of research and development for the Army. Tell us, Dr. Martin, how you, if you were in complete charge and had the authority and the responsibility and the authority to allocate the money after it is appropriated—how would you go out to cut down that lead time?

HOW TO GET THE JOB DONE

Mr. MARTIN. I would do it the way I did in industry. When I had a job to do, I defined the job, got it approved, and got my orders to go ahead, and then I was allowed to run the job on my own.

Mr. WEISL. Who gives you the orders to go ahead in the Army?

Mr. MARTIN. Our orders are generated in a process which goes back and forth. We have proposals that come up either through the Army or from our own technical people, from our own operations people, as to what they would like to have, or they may come to us from some of our contractors. Those ideas are put together in comparison with the needs that the operational people have indicated, and out of that comes the proposal to develop something—some new piece of equipment or some new weapon.

Mr. WEISL. How long does it take for that proposal to come out after the idea is conceived?

Mr. MARTIN. I could not say on any definite basis.

Mr. WEISL. Our charts indicate it takes about 5 years from the time that the idea is conceived and accepted to the time that a design is made and the contract let out to industry. Do you agree with that?

Mr. MARTIN. That has happened in some cases, I know. I don't think it needs to take as long as that.

Mr. WEISL. You are taking steps insofar as it is possible in your job in the Army to eliminate that lead time?

Mr. MARTIN. Very much so.

Mr. WEISL. What can be done during the development of an item to insure its suitability for production and operation?

Mr. MARTIN. I would like to make 1 or 2 more comments about your previous question, if I may.

Mr. WEISL. Yes, sir.

Mr. MARTIN. Because I do not think we covered all of the factors in it. One of the important things in this procedure that you mentioned of the time it takes to get a job going, comes back to the question that has been mentioned time and again here today; that is the matter of what we call the decision-making process. It is delay in decisions which really is an important factor, and that comes back to the people who have to make these decisions, their skills, the knowledge available to them. If we can do a better job in getting more competent people in our supervisory and management positions, and also get to them better advice which they can put their faith in, I think we can cut down that time.

There is another very important factor in this matter of progress, and this has also been mentioned this morning a number of times: the matter of funding.

Mr. WEISL. A matter of funding?

Mr. MARTIN. Funding, financing.

Mr. WEISL. Yes, sir.

Mr. MARTIN. After you have determined what the job is and plan as how you are going to do it——

Mr. WEISL. Will you pardon us, Dr. Martin. Senator Saltonstall would like to ask Dr. von Braun one more question.

Senator STENNIS. Mr. Martin, just keep your seat.

Dr. von Braun, will you take the chair there by him.

TESTIMONY OF DR. WERNER von BRAUN—Resumed

Senator SALTONSTALL. Mr. Chairman, I appreciate your courtesy and I appreciate the courtesy of the chairman of the committee to whom I have spoken.

Doctor, what confused me is this, and you and I have just had a little talk out in the hall. I am not clear from your testimony, first, to Senators Johnson and myself and then to Senator Symington, just what your thought is with relation to this administrative setup. As I understand it, you would take the space program out and put it under a separate agency similar, we will say, to the Atomic Energy Commission. If it was a new undertaking, you would like to put the missile work out there with it, but the missile agencies having been developed in the military services, you would leave them for the time being in any event in the military services.

Now, my question is this: We have been talking here in the days gone by and today about one authority to make a decision, one authority to spend the money. My question to you is: If you put a new agency, a space agency, outside of the Department of Defense, would you still have, in your opinion, 1 overall authority, 1 man who would be able to make the decision as to whether for example a million dollars should be put into missiles or whether that million dollars would be put over into the Space Agency.

Would you please clarify to me, in any event, your statement on that?

Dr. VON BRAUN. Sir, my reasoning is the following: I believe that today both in the ICBM and the IRBM area, more than 50 percent of the difficulties involve the problem of fielding these missiles, in other words, of deploying them operationally. In the ICBM and IRBM area land base, the Strategic Air Command of the Air Force has been given this job just recently. If you take the assignment of these missiles away from the Air Force and give it to a newly formed Space Agency, you create a new liaison problem between the Strategic Air Command and that Central Space Agency.

My feeling was that this may retard the immediate deployment of the ICBM's and IRBM's more than can be tolerated at this time, so this would be a rather dangerous move, this late in the game.

In the conquest of space area, however, there is no active program worth mentioning in existence. This is even attested to by the Deputy Commander of the Air Research and Development Command, General Dengler, who made a speech recently wherein he said 6 months

ago there was no space program in the Air Force. So whenever you hear about fabulous space programs today, it is all postsputnik. There is nothing really——

Senator SALTONSTALL. Then would you have one man on top of both those agencies to be able to make quick decisions and get action?

Dr. von BRAUN. Sir, I believe that any possible interference in the industrial areas, shall we say, who gets what hardware from North American or from Chrysler, or from Convair, can be worked out between the Space Agency and the ICBM and IRBM project managers, with the simple understanding that the Space Agency manager must not interfere with the missile schedules. I am convinced that a workable arrangement in this area can be worked out.

Senator SALTONSTALL. So that there would not be one man on top of both programs?

Dr. von BRAUN. No.

Senator SALTONSTALL. Then you have clarified it.

Dr. von BRAUN. My feeling is it would be better for the ICBM and IRBM programs to leave them in the services, at least for the time being, because they have been there that long; but organize a space agency separately to handle the conquest of space and nothing else, plus the research programs involved in this space project.

Senator SALTONSTALL. It is clear now in my mind.

Senator STENNIS. Very well. Any other questions on this point?

Senator SYMINGTON.

Senator SYMINGTON. Dr. von Braun, I want to be sure I understand you. My question was if the services agree that the IRBM and the ICBM should go into the space agency, would you believe that was the right place for them, and I think you said you would.

Dr. von BRAUN. Yes, sir, I would.

Senator SYMINGTON. If you say that, does not that mean—I believe you used the expression “rock the boat”—you did not want to rock the boat. But if it had been decided earlier, you would have preferred to have the IRBM and ICBM in the space agency; is that correct?

Dr. von BRAUN. Yes, sir, definitely.

Senator SYMINGTON. If it could have been done earlier?

Dr. von BRAUN. Yes, sir.

Senator SYMINGTON. And in that way you would have one person in charge of space, and one the military setup?

Dr. von BRAUN. Yes, sir.

Senator SYMINGTON. Is that correct?

Dr. von BRAUN. Yes, sir.

Senator SYMINGTON. I do not agree with you on that because the missile is not only a weapon, but it is a weapons system. I believe the Polaris may be the most important ultimate weapon of the five we are working on today, because it has solid fuel. It may not be, but it may be. If you take it out and put a weapon like that specifically designed for ships, in a space agency, in effect, as I see it you take away the capacity, or the responsibility, or the authority or all three, from the Navy to defend the country in case of trouble.

In effort to follow you correctly, suppose you had a manned space ship which could be a warship in the air, an air warship of a character. Would you put that in the space agency, or would you let the services

decide which one of them should get it? Presumably it would go to the Air Force.

Dr. VON BRAUN. Sir, I believe there are only two possibilities. Either you say the missiles remain in the services—Polaris in the Navy and the IRBM's and ICBM's either in the Strategic Air Command, or, as was suggested earlier (I think by Senator Flanders), mobile ballistic missiles would be assigned to the Army—at any rate, the services would retain and operate the missiles.

This is one way of doing it. In this case the Space Agency would be solely in charge of the general conquest of space—minus missiles—and merely happen to use the same suppliers as the missile programs.

Senator SYMINGTON. I understand that. How about the manned missile now? Ultimately we will have manned missiles. There is a lot of space between 800 miles out and 100,000 feet up. We may have manned missiles at high supersonic speeds, very high mach numbers. Where would they go—in the Space Agency or one of the services?

Dr. VON BRAUN. Sir, I think once we have reached that stage, another quite drastic step exceeding the present concept of the Space Agency would be necessary, namely, the formation of what we might call the United States Space Forces.

Senator SYMINGTON. Then what you are really saying is that ultimately, and this is important to us because we may, after 10 years of effort, get some legislation in this field to save billions, what you are saying is that, in your opinion, ultimately the ideal setup would be the consolidation of all space and all military effort under one man; is that correct?

Dr. VON BRAUN. Yes, sir.

Senator SYMINGTON. Thank you.

Dr. VON BRAUN. But then you have to get one step beyond mere technical responsibility, Senator Symington, and take a chunk out of the Strategic Air Command and also give it to that chief space man so he has the means to also deploy these weapons.

Senator SYMINGTON. Granted, one man would run it; would he not?

Dr. VON BRAUN. Yes.

Senator SYMINGTON. Thank you.

Senator STENNIS. Thank you again, Doctor, for your testimony.

All right, Counsel.

TESTIMONY OF WILLIAM H. MARTIN—Resumed

Mr. WEISL. Dr. Martin, had you finished your answer?

Mr. MARTIN. We were discussing the question of funding on carrying through the development programs. This, I think, is a very important factor and there is a distinction that needs to be made here.

In carrying out our development programs today, we are working in a field where the technology is evolving very rapidly. This applies to the whole technological field, but in the military field in particular because of the large amount of activity and support we are putting into that field. If we do not carry through our developments correspondingly rapidly, we are likely to get things available at a time that they are obsolete from the technical standpoint, and that means they are not good enough.

Now, with the available technology, with the available skills, available facilities, there is an optimum rate of progress, and in carrying through our development jobs, we should fund the important jobs at this optimum rate. That means that you determine how long you should take to do that job on a good schedule, and then you fund it and you fund it not just part of a year at a time but preferably several years' programs so that you can carry it through.

Now, if we are funding our jobs at lower rates than what I have called optimum, we are tending to buy obsolete equipment. I think this is a very important factor when we consider the matter of resources available, as have been talked about here today. When you have a total amount of resources and you have a number of things you need to do and you cannot fund them all at the optimum rate, the tendency is to try to carry a number of them at less than the optimum rate. Insofar as you do that, you run a great risk of coming up with obsolete equipment when you are through.

I stress this because this matter of rate of progress is something that is very easy to delay, and if you delay it too much and try to carry all of the jobs that you would like to carry, the result may be disastrous from the standpoint of getting things too late to be effective.

Mr. WEISL. We are all seeking ways and means, Dr. Martin, of getting that done, and you believe that the way to do it is to get competent men without the interference of committees, without advisory boards, and give them authority and responsibility in funding?

Mr. MARTIN. If you get competent people, you do not have to have all these advisory boards.

Mr. WEISL. I am sure you are a competent man, and we have got advisory boards in the Army; haven't we?

COMMITTEES HAVE CERTAIN VALUE

Mr. MARTIN. Oh, yes. I wouldn't do without advisory boards. They have their place, as Dr. von Braun indicated here this morning.

Mr. WEISL. What is your concept of the relationship between the military and industry in carrying out a development operation such as you talked about, and the part that each of them ought to play in the picture?

Mr. MARTIN. Well, my feeling, very strongly, is that in carrying out the development of our military weapons today, we need to depend very definitely upon a strong team consisting of both military and industry.

There is some tendency at times to say that industry is all-wise in this field, and that the military should turn all their problems over to the industry, and industry will carry them out for them.

I have been in industry, and I know how it works from an industry standpoint.

There are, however, certain responsibilities which the military people have which they cannot delegate to someone else. The military man is the man who is going to use these weapons when they are finished. He has got to determine what it is he wants, and how he is going to use it. He has also got to have enough skill to know how to pick competent people to do the jobs for him.

He has also got to know how to evaluate, for his own purposes, the results of that work.

Now, in order to carry out the military responsibilities in a complex technical field of this sort, the military have to have internally competent, hard-working people who know enough about the technology to bridge the relationship between what the operating military man wants in combat conditions, and what the technical laboratories and production facilities can turn out for him.

And that brings in another factor, on which you started to question me and we dropped, as to how we can make our developments more suitable for production and use while they are being developed. This is a very important factor from the standpoint of shortening this time cycle that you mentioned in your earlier question.

In the past, we have tended to look upon research, development, design for production, production and use, as separate operations in the procedure which must come in series. Now we have learned today in carrying through our programs, to carry out these separate operations not in series but concurrently. In doing that we can very materially cut down this time period. For example, during the development period, you should be working with the production contractor and get him started on his tooling, his preparation for production, while the development is still going on.

At the same time, the operational people should have close contact with the development organization so that the development man is continuously aware of what it is that the operational man needs and how he is going to use it, how he is going to maintain it, what kind of skills he is going to have available. By this concurrent or overlapping procedure, you can get much better results in much less time.

This job I mentioned earlier that I was associated with Dr. Houston on during the war, was an outstanding example of that kind of concurrence of operation.

MR. WEISL. I am sure you are right, Dr. Martin. But is that what is being done now? You heard the testimony of General Medaris and Dr. von Braun. They have not been able to get the money or the check or the funding to get Chrysler to tool up for the production of Jupiter.

MR. MARTIN. Well, they were speaking about one stage of it. They also mentioned the fact which I am very proud of the fact that they have been able to do it that during their development and while they are making experimental equipment down at Redstone Arsenal, they have had there with them the engineers of Chrysler, the organization which is going to make the production missiles. They are getting the advice of the production engineers in setting up their tooling and their processing in the experimental phases. That is going a long way toward making it possible to reduce the time in getting production going. This is a very desirable factor and is being increasingly used in the military programs.

COMPENSATION FACTOR

MR. WEISL. Very good, Dr. Martin.

You speak of getting top-level men and getting competent military men and competent civilians and competent scientific men. What can we do to get those types of individuals into the military or into Government service?

Mr. MARTIN. Well, one very important thing, of course, is the matter of compensation. And this is the thing today where in Government we are very limited in our competition with industry. We have a number of competent people in Government and in the military. We have many of them there because they are sincere, dedicated people who are willing to make sacrifices to work for the Government and for the military.

This applies not only at the lower levels of the development organization, but it also applies right up the line to the top, to the appointive officers, whom we have been talking about this morning, in Defense, in the military services. We need to have better incentives, we need to have better conditions by which to attract these people.

At the present time, at the top levels, we are pretty much limited to those people who can afford to make a sacrifice and jeopardize, in some cases, their careers. Because they have other resources, they can take on these responsibilities.

As a result of this situation—and, of course, the conflict of interest comes in here, also, to limited people who are willing to take these responsibilities—as a result of this, we get people in the top layers of the defense organization who feel that they cannot make such sacrifices for more than a year or two. That gives this short tenure which is also sometimes questioned as causing the trouble of getting the necessary background and experience to make decisions quickly.

Mr. WEISL. Dr. Martin, we have heard some testimony about interservice rivalry, and the wasteful competition that takes place in the development programs.

Should there be competition or duplication in the development of complex new weapons systems?

Mr. MARTIN. I think when we discuss a matter like this, we have to analyze it a little bit, and indicate what we are talking about.

In the early parts of a development project where we are trying to get a new device or a new weapon, new piece of equipment, it is very important to carry out on an exploratory basis what you might call applied research and exploratory development in several lines to insure we are properly covering the area.

Then, after having carried out those several lines, we should be able to analyze the several approaches and determine from them what is the best single approach to follow to go on into production.

Now, I think some of our so-called rivalry or competition has arisen because we have allowed these exploratory surveys which may be done in separate services, to go on into the hardware stage, without stopping and trying to consolidate them before they get to that point.

Once they have gotten into the hardware stage and embodiments which may be used for warfare, then you have an established position, with all kinds of opinions and pressures built up back of it, which then make it very difficult to pick one as compared to the other, because at that time you have so much organization, facilities, back of it that you hesitate to throw that away and go ahead with only one piece of hardware.

Mr. WEISL. Is there anything, Dr. Martin, that I failed to cover which you would like to tell the committee?

Mr. MARTIN. That is a pretty broad order. The areas I have discussed, about the matter of cutting down the time cycle, I think I have treated in a general way many of these questions. Of course,

there are many details involved in this. I might say this: That in considering these matters of how we do these things and what kind of an organization we set up, there tends to be a situation arising where, when we have a problem, we think the way to answer it is to have a new kind of organization.

I feel today that the potentialities of our organization have not been fully utilized, and I think we should explore, in considering how we carry on from here, as to whether we can make more effective our present organizations before we branch out into a number of new ones.

The organization itself does not settle the questions we are talking about of arriving at decisions or how we get competence.

Mr. WEISL. Thank you very much, Dr. Martin.

Mr. Chairman, those are all the questions that counsel cares to ask at this time.

Senator STENNIS. Senator Saltonstall?

Senator SALTONSTALL. Mr. Chairman I have just one question.

Mr. Martin, when you talk about high-priced men, the Congress last year and for several years now have limited the top civil-service rate men to a lower scale than what the Department wanted; am I not right?

Mr. MARTIN. Yes; this is correct.

Senator SALTONSTALL. And so your problem is pay and getting younger men who are willing to serve?

Mr. MARTIN. That is right.

Senator SALTONSTALL. Thank you, Mr. Chairman.

Senator STENNIS. I do have special questioning here, too, Dr. Martin.

You have given us some very helpful testimony, matters that had not been clearly covered by other witnesses, too.

The question I have thought about, this matter of getting adequate and competent technical personnel within the Government, you mention that now, and you solve that largely by having these contracts and also through the services of people outside, industrial research?

Mr. MARTIN. Yes.

Senator STENNIS. To what extent on a percentage basis do you have to go outside into industrial research to get this work done?

Your opinion on matters like that is worth something.

Mr. MARTIN. Well, I would rather put this the other way around if I might, Senator.

Senator STENNIS. All right.

Mr. MARTIN. As I indicated in one of my earlier answers, there needs to be in the military a certain technical competence, in order to carry out—

Senator STENNIS. Certain what?

Mr. MARTIN. A certain technical competence.

Senator STENNIS. Yes.

Mr. MARTIN. In order to permit the military organization to carry out the responsibilities which I mentioned, which cannot be delegated to anyone else, because they are the responsibilities as to what the military is going to need, how they are going to do it, and is what they get adequate for their needs?

Now in order to get that competence, you first of all have to have the proper incentives to get people to come into the work.

Secondly, in order to keep that competence alive you have to give the people more than just the job passing opinions on other people's proposals or evaluating other people's work.

You have to give them a certain amount of original work on their own to keep them interested, to keep them current with the expanding art and up to date in technology.

Now, to me this is the way you determine how much you should do internally, and this, I feel, should be far less than half of the total amount of effort.

I think we need to depend to a greater degree than we are today on the technology that is available in the universities, in the various nonprofit laboratories and in industry, industry to a large extent.

Senator STENNIS. You mean the majority of this work should be done beyond the services?

Mr. MARTIN. That is right.

Senator STENNIS. At the same time you emphasize the importance of having these men within the service and within other agencies of the Government?

Mr. MARTIN. That is right.

Senator STENNIS. Now, it seems to me that in many avenues of activity that the military is called on to perform that they get enmeshed in their own machinery and their so-called ritual and redtape.

Do you have in mind any suggested changes in existing laws that might give you, say, the Army, more freedom with reference to their own personnel or to industrial personnel?

Mr. MARTIN. Well, on the matter of personnel, I think it——

Senator STENNIS. I mean this scientific personnel?

Mr. MARTIN. Yes; I am talking about scientific personnel.

The thing that Senator Saltonstall mentioned there have been up before Congress in recent years proposals to the military people for so-called Public Law 13's.

I think last year Defense asked for 275 total——

Senator STENNIS. Do you have something definite to recommend—— pardon me for interrupting you.

Do you have something to recommend on that subject?

Mr. MARTIN. Yes. We are now making a current survey again this year. Last year a survey was made and we came up with a recommendation as to definite numbers.

We are surveying the field again right now to see what proposals we should make before the coming Congress.

Senator STENNIS. You mean you are going to ask for legislation, you are planning to ask for legislation on that subject?

Mr. MARTIN. That is my understanding; yes, sir.

Senator STENNIS. Legislation or appropriations.

Mr. MARTIN. Well, legislation. I believe that it requires legislation to increase the number of this personnel and of course it requires appropriations to pay their salaries.

Senator STENNIS. We always know appropriation requests will follow. Yes.

Mr. MARTIN. It is that——

Senator STENNIS. Well, I want to especially thank you for your very helpful testimony here, and it is obvious that the Army research team is well led, I think, and has high morale, and we appreciate very much your contribution.

If there is nothing further from counsel, if there is nothing further from the committee or from counsel, you will be excused with the thanks of the committee.

Thank you.

The committee without objection will now take a 5-minute recess. (Short recess.)

Senator JOHNSON. Our next witness is Secretary of the Navy Thomas S. Gates.

Mr. Gates, it is a pleasure to welcome you before the committee today. You have had a distinguished career which covers both business and active naval service during World War II.

The committee is well aware of the extremely important role that will be played by the Navy in the development of the weapons of the future. You have specific roles and specific assignments, and insofar as I am aware there has been no controversy about your role.

We are going to hear from you and your staff experts on the progress of the Navy's plans. We expect the testimony of your Department to be direct and to the point in the tradition of the naval commander who runs a taut ship.

In order to save time, I am having your biography inserted in the record.

(Secretary Gates' biography is as follows:)

Thomas S. Gates, Jr., was born in Germantown, Pa., on April 10, 1906.

After graduating from the University of Pennsylvania in 1928, Mr. Gates joined the firm of Drexel & Co., investment bankers. In 1940, Mr. Gates was made a partner in this firm. In addition, he has been a director of the Beaver Coal Corp., the Scott Paper Co., and the International Basic Economy Corp.

During World War II, Mr. Gates was commissioned in the Naval Reserve and served on active duty from April 1, 1942, until his release to inactive duty in October 1945.

He graduated from the Quonset Point Air Intelligence School. In the spring of 1943, he was assigned to the U. S. S. *Monterey* and served in the Pacific for approximately 1 year. In the summer of 1944, he was assigned to the staff of Rear Adm. C. T. Durgin during the invasion of southern France.

Immediately following this, he was sent back to the Pacific where he remained until the end of the war, taking part in the Philippine liberation and the Iwo Jima and Okinawa campaigns.

For his war service, Mr. Gates was awarded the Bronze Star and a Gold Star in lieu of a second Bronze Star. In December 1953 he was promoted to Captain, USNR, and placed on the retired list.

Since the war, Mr. Gates has served as a member of the Naval Advisory Council of the Bureau of Aeronautics.

Mr. Gates was appointed Under Secretary of the Navy by President Eisenhower and assumed that office in October 1953. One of his first assignments was as Chairman of the Navy Reorganization Committee. On April 1, 1957, he succeeded the Honorable Charles S. Thomas as Secretary of the Navy.

Senator JOHNSON. Will you raise your right hand, Mr. Gates?

Do you solemnly swear that the testimony you give this committee will be the whole truth and nothing but the truth?

Secretary GATES. I do.

Senator JOHNSON. Proceed, counsel, with your examination.

TESTIMONY OF THE HONORABLE THOMAS S. GATES, JR., SECRETARY OF THE NAVY

Mr. WEISL. Mr. Secretary, have you a prepared statement that you would like to read to the committee?

Secretary GATES. I have, sir.

Mr. WEISL. Will you please read it?

Secretary GATES. Mr. Chairman, my associates and I share this opportunity to present to this important committee of the United States Senate the views and current thinking of the United States Navy. We meet together under difficult and serious circumstances—at a time that is most important in our national life.

As I report to you on the state of the Navy and make certain you are informed of all the facts that pertain to our affairs, I am reminded of the enormous military changes that have occurred since I came to the Department of the Navy in 1953.

The Congress, and the members of this committee of the Senate have participated in these far-reaching changes.

Together we have seen it happen.

We know that today and tomorrow have left the past forever. It is an extraordinary period in our history, and it came upon us very quickly.

The effect has been great on everyone—so great that some take it for granted because it is not easy to grasp completely.

The effect on the United States Navy is comprehensive and final. Missiles are here. Guns are gone. Aircraft must now be supersonic. Atomic propulsion is in fleet service and we are moving toward an atomic Navy. It is a very big, expensive and difficult thing to do but it can be done, and it is essential.

A time of change is a time to get things done—these years have seen us fit the Navy into the national effort.

Always we walk a difficult line—a careful, calculated balance between immediate readiness and modernization for the future.

We have been and always will be alert. We know that the United States is faced with a tough, capable, and ruthless enemy, whose objective of world domination never varies.

To be alert and ready must have our primary attention, yet progress has come fast and been great and we must lead. This is the balance—the compromise we make. It affects every decision, every day.

We struggle with this balance because of the vital contribution we make to our defense. As a sea-based force, we add to the total United States deterrent power, and we have the responsibility of preserving the freedom of the seas which link the free world together.

It is Navy policy in everything we do to get the greatest military worth—the most military strength possible.

Dollars are not important when national security is involved. They are only a measure of manpower, materials, and effort.

As an American measure we use them. We do not consider them all important but we consider we owe it to our fellow citizens to get the most military strength for our money.

In this time of change we have made hard choices. We have divorced ourselves from the past. We have forgotten a number of the things that once were very important. We have reduced certain ships and aircraft.

We have cutback on World War II support activities. Choices of this kind will inevitably be necessary and will continue to face us. Again we face balance and decision between readiness and the new things we need and we can get.

We do this to put our chips on the things that count most: missiles, advanced aircraft, nuclear-powered ships, triphibious marines, lean, hard, and ready combat forces.

We must continue to improve our quality, especially in advanced technology, in readiness and in people. Our decisions affect people who live for long periods without bases and homes—people sharing the same ambitions and hopes and needs as anyone else. The quality and spirit of those people is our greatest resource for the future, and we must always encourage them.

In these brief minutes I have the honor and the responsibility of representing the United States Navy and discussing its policies and programs.

I want you to be sure that I have thought of the best interest of the United States, not exclusively the Navy. My associates and I believe in strong services, in a strong economy, in a strong country.

We are mindful we must not default the goal of peace while building strength. We do not pretend to know all the answers. We do pledge ourselves to work together, in an affirmative spirit, with open minds, to enhance our national strength.

As a nation, we require military power and prestige that is sufficient—

First, to make it unthinkable to any aggressor to risk all-out war.

Second, to prevent—if necessary to win decisively—anym limited war or aggression.

Third, to support the national policy in the cold war. The United States must be sure it can meet all these requirements. None can be omitted.

The Navy has no ambitions to grow bigger for bigness' sake, to do anything alone, or to make any undue claims. We do believe that our special tasks and the capabilities of the Navy and the marines are most essential.

As we appraise the threat that faces us and look ahead, it is inevitable that we must use the seas to strengthen our national deterrent power and reduce our vulnerability.

We can make a significant increase in the striking power of our sea-based systems. In a short term, we can considerably improve the volume and military capabilities of carrier aircraft strikes.

In emergencies, we can put more ships to sea, as we have in the past. This we can do in a hurry. Over a longer period we can accelerate the Polaris nuclear-propelled ballistic missile submarines, the high-performance jet seaplanes, and other sea-based weapons system.

MEASURES TO DIVERT ENEMY FIRE

These measures would not only increase the total capability of the United States, but would impose severe defensive problems on an enemy—problems that would be different, burdensome, and sometimes insoluble. Certainly they would force an enemy to divert some of his fire away from our land and our allies.

The nature of the enemy threat demands a change in emphasis, a deployment of much more of the national striking capability from land to the high seas.

We can use the high seas as a springboard for offensive operations and as a vast maneuver area for the defense in depth of ourselves and our allies. This will remove any enemy hope that our ability to strike back could be eliminated by a surprise attack.

Given a shield of mutual deterrence, power to prevent limited aggression and to win limited war becomes decisive.

Clearly this power demands combat forces in being: strong, mobile, and versatile.

We have great pride in our deployed forces—the Sixth and Seventh Fleets—the United States Marine Forces, the contribution they make to the peace and their potential in war.

To keep them strong and capable requires advanced scientific and technical development, just as much as ballistic missile war.

We have still another task that is traditional to the Navy, yet continuously renewed by the advances of science—to keep alive the freedom of the seas. The free world is an oceanic coalition. Across the seas we must provide the military, economic, and political links that cement us together.

This control of the seas is threatened as never before by the Soviet Navy, and particularly by their massive submarine forces. It is an extraordinary and challenging task to contain these submarines and to deal with their threat—a threat not only to our sea lifelines, with their missile firing capabilities, it is a threat to our heart land itself.

This is a Navy responsibility we live with. We have made some encouraging progress—but it would be very wrong to claim we have it licked.

We are taking every avenue of approach, but we must do a great deal more, especially in research, advanced technology and antisubmarine forces in being before we can be sure of success.

Ability to conduct successfully our foreign policy depends critically on military and technical prestige, which in the long term is the mirror of military reality.

Realistic military planning demands balance between military objectives, and between weapons systems to meet any single objective.

We try always to think of the future. Since World War II, the Office of Naval Research has pioneered the United States effort in research, and continues to enjoy a remarkable reputation.

Additional scientific research is essential. The scientists working in electronics and in the related fields are striking ahead. Working in the physics of the solid state, they have given us miniature electronic equipment of all kinds, running on very low power. They are giving us a means of multiplying radar detection ranges, improving communications, revolutionizing data handling—taking a decisive lead in electronic warfare.

Nuclear power is still in its infancy, yet already the *Nautilus* has written naval history—and her extended cruise under the polar icecap has dramatized the capabilities of the nuclear submarine and the importance of the Arctic.

We lead the world in nuclear power. We intend never to lose the lead.

We can help with the national effort to explore outer space.

The ballistic missile art may be revolutionized by our work in the chemistry of solid rocket propellents.

We certainly can expect setbacks and temporary failures in the future, as we have experienced them in the past. This is a part of the very nature of scientific development.

Yet we have deep confidence in the future accomplishment of our scientific teams, based on their capabilities and their sound performance. We want to encourage them, support them, and apply their results as rapidly as possible.

We take a considerable pride in our scientific record. We have not been last to recognize and support advanced science in the national interest. We have long supported, and have recently greatly expanded in the technical education of officers and especially of young enlisted men.

Dedicated young officers and men, young scientists and technicians, young sailors, marines, soldiers, and airmen are in fact our greatest military resource. We should be very sure that they can find in our armed services a worthy and attractive career.

In conclusion, Mr. Chairman:

The Navy can contribute to the future.

We can improve naval quality.

We can make great strides in missile warfare, antisubmarine warfare, control of the seas.

We can continue to support national policy with mobile strength based on the sea.

All of these things we firmly believe we should do, in the national interest.

We believe they must be done even if life as usual is interrupted and sacrifices on the part of our people are required.

Senator JOHNSON. Thank you very much, Mr. Secretary.

Mr. Counsel, will you question the witness?

Mr. WEISL. Mr. Secretary, we have had considerable evidence presented to us concerning the tremendous capability of the Soviet Union in missile developments.

What role will the Navy play or does the Navy plan to play in connection with and in relation to those great missile programs which the Soviet Union apparently has developed?

Secretary GATES. Mr. Weisl, as I said in my statement, I think the sensible thing to do for the country is to put more of our deterrent power at sea in light of these missile developments where ships and striking forces at sea are relatively immune from ballistic missile attack.

This can be done by a number of systems with which I believe the committee are familiar or will hear from later witnesses.

Mr. WEISL. We will have testimony on that subject from Admiral Burke and his staff I presume.

Secretary GATES. Yes, sir.

Mr. WEISL. Have you any testimony to give or any evidence to present which will make it possible for the Navy to make any new or added contributions toward improving our deterrent power against a potential enemy?

Secretary GATES. Yes, sir; we could as far as added power is concerned, we could enhance our carrier striking force capabilities.

As far as new deterrent power is concerned, we are working very hard on the Polaris missile system, which we propose to accelerate, which would be a completely new type of deterrent power.

Mr. WEISL. Does the Navy need additional funds to improve its program and its deterrent force and its efficiency?

Secretary GATES. I am sure it will, sir.

Mr. WEISL. And I presume your staff or Admiral Burke's staff will give some evidence in that respect to the committee.

Secretary GATES. I am sure they will answer questions here; yes.

Mr. WEISL. We have had recommendations, Mr. Secretary, from men like General Doolittle, Dr. Vannevar Bush, and yesterday from

General Gavin, concerning a reorganization of the Defense Department so that the Secretary of Defense can get independent advice in no way diluted by the interests of one particular service or another.

Would you care to give the committee some comments on that?

Secretary GATES. Yes, sir. I think that most of the problems that have been pointed up in the Department of Defense are problems involving decisions, decisions to very difficult questions.

Sometimes they do not even have any answer; they have opinion rather than an answer.

I personally believe in the present Joint Chiefs of Staff system. I do not know what good it would do to have another kind of a staff or what the difference would particularly be.

The Secretary of Defense has all the authority that he needs, and the Joint Chiefs of Staff are his advisory body.

I do not think it is unwise to sometimes have differences of opinion sharply focused by the Joint Chiefs of Staff. After all, decisions nowadays are not always military. They are political, they are economic, and they are financial and military. Difference of opinion, sharply focused, brings it to the attention of people who can make decisions and have the authority and power to do so.

I feel also that sometimes there are perhaps too many committees and too many groups with veto power without the responsibility. The real responsibility lies with the Secretary of Defense, and the services, and I feel a little differently from what seems to be the popular trend, I am afraid. I feel the service prestige should be increased.

I am sure I will be accused of self-aggrandizement when I say that I think the service Secretaries should be members of the National Security Council or the Cabinet, or both, again, the way they were once.

I think that the Secretary of Defense can expect statesmanship from his service Secretaries and should use the Secretaries as in effect his cabinet to help advise him on difficult decisions.

Mr. WEISL. You know Robert Lovett, do you not?

Secretary GATES. Very well, sir. I have a great respect for him.

Mr. WEISL. Mr. Lovett, when he left the Department of Defense, wrote a letter—

Secretary GATES. Yes, sir.

Mr. WEISL (continuing). Which he thought about very carefully, for many weeks and in that letter he stated that there was a great need for the Secretary of Defense, in passing on complex problems, to have some independent advisory board or persons to advise him on the complex problems that he must pass upon.

Do you agree with Mr. Lovett's viewpoint in that respect?

Secretary GATES. Mr. Weisl, I think Bob Lovett wrote the best papers of any I have read at the Pentagon. He is a very fine man. I do not agree with him in this connection.

The Joint Chiefs of Staff, to me, are capable and do advise in the same respect and they are directly related to the authority that they have. I feel to have a separate group further removed from authority and responsibility would just add more confusion than now exists, and perhaps would not sharply focus up the problems which, as I said in the beginning, are extremely difficult.

Mr. WEISL. Since Admiral Burke, Chief of Naval Operations, and his associates will testify directly on the operation of the Navy—
Secretary GATES. Yes, sir.

Mr. WEISL (continuing). I will defer all the questioning, Mr. Chairman, of Mr. Gates until they appear.

Senator JOHNSON. Thank you.

Senator Flanders?

Senator FLANDERS. No questions.

Senator JOHNSON. Senator Stennis?

Senator STENNIS. I have no additional questions, Mr. Chairman.

I want to thank the Secretary for a very fine statement here that I have not only listened to but I have studied some of the major points already.

Secretary GATES. Thank you, Senator Stennis.

Senator JOHNSON. Mr. Secretary, we are very pleased with the testimony you have given, and the committee thanks you for your contribution, and hopes your staff can find ways of speeding up the many promising developments that come under your Department. Thank you very much.

Secretary GATES. Thank you, Mr. Chairman.

Senator JOHNSON. The next witness is Adm. Arleigh Burke, Chief of Naval Operations.

Admiral Burke, do you solemnly swear the testimony you will give this committee will be the whole truth and nothing but the truth?

Admiral BURKE. I do, sir.

TESTIMONY OF ADM. ARLEIGH BURKE, USN, CHIEF OF NAVAL OPERATIONS

Senator JOHNSON. Admiral Burke, we welcome you to the committee and we are very pleased to have this opportunity to have your testimony.

Counsel, will you proceed with your examination. But first we will insert in the record the biography of Admiral Burke:

ADM. ARLEIGH A. BURKE

Arleigh A. Burke was born in Boulder, Colo., on October 19, 1901. On June 8, 1923, he was graduated from the United States Naval Academy.

Until July 1940 Admiral Burke served in battleships and destroyers. Also, he received the degree of master of science and engineering at the University of Michigan. From August 1940 until January 1943 he was assigned at the Naval Gun Factory in Washington, D. C. In February 1943 he received orders to the South Pacific where he successively commanded Destroyers Divisions 43 and 44, Destroyer Squadron 12, and Destroyer Squadron 23. This latter squadron covered the initial landings in Bougainville in November 1943, and fought in 22 separate engagements during the next 4 months.

In March of 1944 he became Chief of Staff to Commander, Fast Carrier Task Force 58. While serving with this carrier force, Arleigh Burke was promoted to commodore, and participated in all its naval engagements until June 1945 shortly before the surrender of Japan. He flew many combat missions. He was aboard both *Bunker Hill* and *Enterprise* when they were hit by Japanese suicide planes during the Okinawa campaign.

At the outbreak of the Korean war Admiral Burke was appointed Deputy Chief of Staff to Commander Naval Forces, Far East. From there, he assumed command of Cruiser Division 5, and in July 1951 he was made a member of United Nations truce delegation to negotiate with the Communists for a military armistice in Korea. After 6 months in this capacity he returned to the Office of Chief of Naval Operations where he served as Director of Strategic Plans Division until 1954.

In April 1954, he took command of Cruiser Division 6, and in January 1955 assumed command of Destroyer Force Atlantic Fleet in which capacity he served until he became Chief of Naval Operations in August 1955.

Admiral Burke has received numerous combat awards during his service in the Navy including the Distinguished Service Medal, the Navy Cross, the Legion of Merit, and the Purple Heart.

Mr. WEISL. Admiral Burke, have you a statement to make to the committee?

Admiral BURKE. Yes, sir, I have, sir.

Mr. WEISL. Please read it.

Admiral BURKE. Mr. Chairman and gentlemen, I welcome this opportunity to appear before this committee.

The primary task of the Navy is to maintain control of the seas, so that we can assure security for ourselves and for our allies, and help discourage and deter would-be aggressors from destroying the peace of the world.

The Navy must keep alert and resolutely modern in the urgent role she has jointly with the other services, of maintaining the deterrent capability of the United States. There is nothing aggressive nor threatening to peace-loving people anywhere in a strong American military posture. However, this posture must be capable of meeting, as well as cooling off, threats of destruction against us.

Remarkable changes have taken place in the field of science and technology in the last decade and a half. And I need hardly remind you of the revolutionary changes in naval warfare that lie immediately ahead with the beginning of our nuclear fleet.

During the past several years we have witnessed the technological advances of the Soviet Union. We have seen them develop atomic weapons, long-range aircraft, electronic devices, and a Navy second only to the United States with unprecedented numbers of submarines for a Navy in peacetime. The Soviets have told us of their efforts to educate their scientists.

However, during the time that Russia was making these advances, the United States led in all of these fields of endeavor.

The launching of Sputniks I and II came as a jolt to the American people. Here was a new frontier opened up. But we had all been planning to open up this frontier. The fact that the Soviets had been first to do it suddenly brought home the realization that we had new tasks ahead. We have been reminded once again of the need and inspiration of our rugged American philosophy that there are always new frontiers to face and to cross.

During the past several months, and before the sputniks, we have had long and searching discussions as to the best courses of action to maintain the lead in missile warfare.

The Navy will continue to scrutinize its programs and changes will be made wherever possible to take advantage of our own new technological advances and to counter new possible threats.

The most difficult problem that I have as Chief of Naval Operations is to achieve the proper balance between immediate readiness and future capability.

The Navy is frequently called upon for action now—as it was in the crisis over Suez—and more recently in the eastern Mediterranean and in the western Pacific. We cannot reduce the immediate capability of our operational forces below that which is necessary to deal with events that might involve either a local war—or a general war.

We do recognize that technology is making rapid advances—that the majority of our ships are getting old and that the new equipment which will enable us to carry out our duties and responsibilities in a war, say, 5 years or more from now, is complicated and, consequently, very expensive.

We realize the great urgency of developing better equipment and modern weapons to maintain the freedom of the seas against the threats of destruction which can be brought against us.

UNITED STATES MUST MAINTAIN CONTROL OF THE SEAS

Our whole concept of collective security is dependent upon the ability of the United States to strike its enemies with devastating power no matter what they do—and to support and to reinforce our allies. This requires that the United States maintain control of the seas, so that we can reach our allies, support and supply our own forces overseas, and destroy the enemy's military strength in his own territory.

Because of this urgent need for better equipment, the Navy has taken drastic steps to acquire the money for new ships, new aircraft, and new equipment.

We have reduced our Shore Establishment substantially. We have reduced the number of people in the Navy. We are reducing the number of ships by about 100—over 10 percent of our operating forces. We are reducing the number of operating aircraft by approximately 1,300—a heavy reduction—also over 10 percent.

These things, which reduce our immediate readiness, we have done in order to develop and acquire modern ships, modern aircraft, and modern equipment.

I would not like to imply that our immediate readiness has been decreased in numerical proportion to the numbers I have just stated. The weapons that we now have are better than the weapons we had a few years ago.

The Navy must always maintain a readiness for a general war. Our Sixth and Seventh Fleets, deployed and alert, are ready for action and in a position to move into action quickly and launch their strikes. As these fleets move into action, the remainder of our fleets would be deployed.

These naval forces contribute significantly to the total deterrent power of the United States. Their importance in the preservation of world peace is unquestioned.

It is quite obvious that Soviet intentions are to pursue rapid development of missiles, particularly long-range ballistic missiles, in addition to their tremendous strength in conventional forces, in the expectation that this course of action offers the best prospect of achieving military and psychological advantages over the United States.

We are approaching the era of ballistic missiles—and possibly a condition of nuclear stalemate. Now the United States has the capability of inflicting extensive and perhaps total damage on the military forces of any prospective enemy. We have superior destructive capability now by virtue of the Strategic Air Command, naval striking power, missiles, and tactical air. On the other hand, the Soviets now, or soon will, have a capacity of inflicting extensive damage on the United States.

MANNED AIRCRAFT STILL IMPORTANT

Long-range missiles will be an important, a very significant, addition to the arsenals of military forces. But neither ballistic nor guided missiles have replaced manned aircraft. Nor are they likely to within the next few years. We must insure that our strength is sufficient to destroy the military power of an opponent, no matter what he does or when he tries it.

Also, we must not discard those strategic concepts and weapons systems, upon which our military strength rests today, without a most careful appraisal. Particularly not until we have available and operational other proven means of accomplishing our military objectives.

A general nuclear war now means that both the United States and Russia would be most severely damaged. Under these circumstances, initiation of a general war by Russia seems unlikely so long as we have the capability of destroying her.

It is likely that the Soviets will do what they have done in the past: pursue alternate and less risky approaches to world domination. They will try to bring their influence to bear by political, economic, culture, psychological, and subversive programs. We believe that this will increase the likelihood of local aggression, which means that there is more likelihood of limited wars, and local incidents.

The Soviets apparently are convinced that this is their best approach since they are continuing to modernize their ground, naval, and tactical air forces and are equipping them with both conventional and nuclear weapons.

They continue to probe and penetrate by putting arms and supplies into the hands of people who will use them to upset existing governments or cause incidents and trouble in any part of the world. The price they exact is control of the people who accept their assistance.

Let me now turn to the future. Missiles—with powerful nuclear warheads—are of grave military significance today. But the Russian nuclear missile is not the only course of action which we must counter.

Exactly what courses of Russian action the United States will have to counter—what will happen in the future—we do not know—for sure.

But we do know that we will have to win in all the courses of action—economic, scientific, technological, psychological, and military.

Not all of the possible Russian courses of action can be countered by military strength—but many of them can. We must have the capability as a nation to function effectively in any situation which may arise. In order to control the situation we must have a wide range of military capabilities—the flexibility to do whatever needs to be done. We need a nuclear devastation capability. But the Nation should avoid channeling its military capabilities to the point where it will be forced to choose between an all-out nuclear war and a course of helpless inaction.

We know also that technology is proceeding at an extremely rapid pace—that the cost of military equipment is rising steadily—that it is necessary to keep our forces modern—and that we must do this within the funds which can be made available to us.

This means that we should strive to obtain Armed Forces possessing versatile characteristics. A principal ingredient of naval forces is their versatility.

We must have the readiness and capability to use nuclear weapons when the situation calls for the use of nuclear weapons. We must have the ability to stop less violent aggression with less drastic means. But this does not mean that we can have 1 set of forces for nuclear war and 1 set for conventional weapons. Insofar as possible, our forces must be capable of using either or both.

It is for these reasons that the Navy believes that versatility and its companion, mobility, are absolutely essential for the future as well as the present. In the missile age more of our offensive power must be truly mobile.

ACCENT ON NUCLEAR POWER

The Navy has made significant progress in the past few years. We lead the world in nuclear power. All of our future submarines will have nuclear powerplants. We are building a nuclear-powered carrier. We are building a nuclear-powered cruiser. Soon we expect to lay down a nuclear-powered frigate.

We know Russia is interested in nuclear power and she is striving hard to get nuclear power into her ships, but the United States is well in the lead.

The Navy has been very fortunate in its operational guided missiles. Our surface-to-air missiles—Tartar, Terrier, and Talos, are excellent. They are accurate and deadly. They are continually being improved. They will get even better.

Our air-to-air missiles in the Sidewinder and the Sparrow series are just as effective.

Our surface-to-surface missiles in the Regulus series are successful.

Our air-to-surface missiles are also good.

About a year ago, we decided that we could produce a small accurate 1,500-mile fleet ballistic missile with a solid propellant. When perfected, it would be more satisfactory for use aboard ship than liquid-propellant systems. This program has had the highest priority in the Navy. We established a separate organization to develop this fleet ballistic-missile system. We laid down a long-range, orderly program for it. We have recently accelerated that program. We have great expectations for this ballistic-missile system. All of the preliminary experiments and tests have met our expectations.

But a word of caution here. The fleet ballistic-missile system, also, is not yet operational. We can expect more problems before it is entirely successful. We have been fortunate so far. But it is a complex device, with many innovations—some are bound to cause trouble.

It might be desirable to point out that this ballistic missile will be launched from specially designed ships. Launched nearer to its target, it should have greater accuracy than a longer range missile. Because of its solid fuel, it should have a quick reaction time. Because it is launched from many positions on the high seas, it will divert enemy offensive effort from our own shores. It can be launched submerged. Its launching position, whether from submarine or surface ship, will be difficult to locate. It is mobile. Its launching platform is under United States sovereignty at all times.

We think Polaris weapons systems will be a significant addition to our national arsenal.

I now come to the most difficult technical problem which confronts the United States Navy—antisubmarine warfare.

Submarines have always been the favorite weapons of aggressive nations.

In World War I, Germany nearly broke the back of the Allies before the submarine menace was controlled. She nearly did it again in World War II.

Russia learned that lesson well.

After World War II, Russia spent several years in studying German, Japanese, and our own submarine warfare and submarines. German scientists were used to get all possible submarine data. Finally, in 1950, she started building submarines. Since then she has built the largest submarine fleet in existence.

She has done this because she realizes that we and our free-world allies must use the seas in order to support our own deployed forces and each other, and to carry the war to Soviet territory.

With the advent of submarine-launched missiles, there is another great danger which she presents to us. Russian submarines could devastate large areas of the United States if we cannot control the submarine menace.

This submarine problem is a grave one for the Navy and the United States.

We recognize the real urgency that is needed to solve this problem. After the last Great War the appearance of the snorkel caused us to devote tremendous scientific effort to counter that new threat. This effort by the scientists of the United States, and the development of new tactics and new equipment, enabled us to reach a position where we could handle successfully conventional-powered snorkel submarines.

But the nuclear powered submarine again gives the submarine the advantage:

We have had to renew our effort.

We have again called upon the scientists of the United States to assist us in solving this problem. We have established an anti-submarine warfare command in the Atlantic whose primary duty is antisubmarine warfare and whose responsibility it is to prevent a successful submarine attack against the continental United States.

Antisubmarine warfare is a warfare of attrition. There is no way of surely destroying all submarines.

The problem of antisubmarine warfare really divides itself into two parts. The insurance in peacetime that enemy submarines are not lurking off our coasts ready to attack—and the destruction of submarines in wartime before they can reach positions from which they can damage the United States or our naval forces.

Each day I and the other senior officers of the Navy are briefed on the suspicious submarine contacts throughout the world. We keep track of these contacts. Some of them, of course, are false contacts and others are not.

We are frequently asked, "Would we know for sure if a single enemy submarine were off our coast," and, unfortunately, the answer to that question is, "No, we would not." However, it is very unlikely a dangerous number of submarines could be off our coast without us knowing it for sure.

If any nation expected to strike the United States and do significant damage, she would have to strike many targets nearly simultaneously. If she struck just one or two targets, even though the areas in which the missiles hit would be devastated, the United States would go to war immediately and launch attacks against the attacking nation.

So it would not be sound for any nation to use too few submarines or too few bombers—or missiles in an initial attack. If a nation is going to attack the United States, wisdom would require her to attack with all the force that she could concentrate for the attack.

With barriers, antisubmarine patrols, hunter-killer forces, anti-submarine submarines on patrol, nuclear and conventional weapons, detection devices and other means, we would be able to detect any significant number of submarines before—several days before—they would be in a position to launch.

A nation would be imprudent indeed to take the chance of tipping her hand in trying to get a substantial number of submarines into launching position—unless she had control of the sea—and could do so without giving warning of her intentions.

NAVY MARSHALS FORCES AGAINST SUBS

Practically all forces of the Navy are used in one form or another, against submarines in this tremendous problem of antisubmarine warfare.

At this point, let me reemphasize that by far the toughest and most elusive aspect of antisubmarine warfare is detection—detection of the submarine that has left its base and is operating at sea.

It follows therefore that the surest way to kill submarines is to do so at their base—before they have put to sea and when they are most vulnerable to attack.

This is a primary task of our mobile carrier striking forces. To seek out and destroy not only the heavily protected fixed coastal bases, but also the mobile tenders and mother ships that will be concealed in bays and harbors.

To do this job requires not only high mobility, but the most modern striking power to get through the defensive forces.

The attack carrier is the heart and backbone of these striking forces. These carriers must be able to operate the various types of aircraft needed for this task—aircraft that must be able to get through to their objective with a suitable payload.

These include strike aircraft which have a long-range strike potential at low altitude, the most difficult type to counter.

These same carrier striking forces are also immediately available for other tasks and missions. They can employ either conventional or thermonuclear weapons. They are equipped with missiles. Their mobility gives them a unique advantage. This feature alone makes them a valuable supplement to our principal retaliatory forces.

To carry out the rest of the antisubmarine warfare campaign:

We will mine the exits and narrow channels through which the enemy submarines must pass.

We will augment the barriers.

We will have our shore-based long-range patrol aircraft searching the wide oceans.

We will have hunter-killer groups operating—constantly searching—in areas of probable enemy submarine concentrations.

We will have aircraft and ships on patrol off our own shores.

And yet, all of this is not good enough. Some enemy submarines will get through—for it is impossible to provide an absolute defense against submarines just as it is against bombers or against anything else. What we can do, if we work hard enough at it, is to make his submarine operations unprofitable—by sinking large numbers of his submarines.

But we can't do this unless we keep progressing and moving ahead. We have got to get even longer range underwater detection devices. We have to get better identification of submarines underwater.

We have to improve our ability to fire antisubmarine weapons at long ranges.

We are working on these problems and we have some ideas that show promise of success. But they are not easy problems and their solution will take time, effort, and money. As new equipment is developed, we will need to produce it and install it in our ships and our aircraft.

New equipment will come from research. We are trying to interest more scientists in the tremendously important but unspectacular work connected with antisubmarine warfare.

SIX POINTS FOR MAINTAINING SUPERIORITY

The United States now has the superior maritime strength in the world and we must maintain it to meet our present and our future national security responsibilities. In order to maintain superiority, we must:

(a) Support research and development programs, especially in anti-submarine warfare, missiles, and electronics.

(b) Emphasize the importance of antisubmarine warfare equipment, procedures, tactics, and doctrine.

(c) Improve, as much as we possibly can, our intelligence so that we may have warning of the enemy's intentions.

(d) Expedite the final development and production of the fleet ballistic missile, Polaris, to insure its earliest deployment at sea.

(e) To support shipbuilding and aircraft procurement programs sufficient to maintain effective fleets capable of occupying and controlling the sea, and providing deterrence and readiness on the spot where they may be needed.

(f) To insure the maintenance of military forces with the versatility and mobility to meet the variety of threats posed by communist power.

The Navy problems are varied and they are complex and difficult. The frontiers of the future are vast. The current situation is serious. It demands determination and great effort to insure security of our Nation.

The Navy has moved into the nuclear-missile age with competence and with a determination to make the most of the opportunity afforded to us by the United States' control of the seas.

Thank you, Mr. Chairman.

Senator JOHNSON. Admiral Burke, we thank you for your testimony and for the contribution you have made to our deliberations.

The hour is late. If counsel will proceed with the examination, we will go on now.

Mr. WEISL. Admiral Burke, as you so very ably pointed out in your thorough presentation of the Navy's strength and problems, the submarine potential of the enemy appears to be one of the greatest dangers that our Nation faces; is that not true?

Admiral BURKE. Yes, sir; I believe that to be true, sir.

Mr. WEISL. May I ask you first, Admiral Burke, do you know whether the Russian Navy has any nuclear submarines?

Admiral BURKE. We do not know, sir. We know that the Russians for the past several years have been extremely interested in nuclear power for ships. We know that they have launched the *Lenin*, an icebreaker. The powerplant we think is not yet in that ship.

We know that she fully realizes the importance of nuclear power and long, high-sustained speed underwater, so she may have a few nuclear powered submarines now. We think she does not have, but she will have some, we think, very shortly.

Mr. WEISL. At least, as far as we know, the nuclear submarine is one field in which we apparently have some lead on the Soviet Union.

Admiral BURKE. Yes, sir.

Mr. WEISL. Do you know, Admiral Burke, whether the Russian Navy has any submarines capable of launching missiles?

Admiral BURKE. Again we do not know, sir. We know that Russia is very competent in missiles. She has done very well in missiles.

We have indications, a few indications which are not conclusive, that may indicate that she has some submarines with missiles. It is not too difficult a problem to install missiles in submarines, or to construct submarines which will fire missiles, but we have no proof, no direct and positive evidence, that she now has missile submarines in existence.

Mr. WEISL. But we do at this time in our own United States Navy have some vessels that are at the present time capable of launching some missiles?

Admiral BURKE. Yes, sir, we do.

Mr. WEISL. So that again in that respect, as far as we know, the United States Navy may be ahead of the Soviet Union.

Admiral BURKE. We may be, sir. We, of course, assume that because Russia has a capability, has a capacity to put missiles in submarines, we assume that she does have them, in our estimates.

Mr. WEISL. Now, Admiral Burke, since the potential menace of the Soviet submarine strength is so great, what has the United States Navy been doing to improve its detection services so that submarines can be detected?

Admiral BURKE. Right after World War II, we had the problem of the snorkel submarine, and we asked a group of scientists to study the problem in coordination with us, to see if there was any way that we could increase our sonar capability.

As a result of those studies, we were able to increase our range of detection several times, quite a few times, and we were able to increase our weapon capability and our computation ability, so that we could handle the submarine, the snorkel submarine.

We have a scientific advisory committee, and we have had special sonar study groups studying this problem of anti-submarine warfare,

particularly detection and identification. We have put all the scientific effort, tried to interest as much scientific effort as we possibly can, into this very difficult problem. That is on detection alone.

Now, that is on ships and submarines and aircraft, all three detection devices.

Mr. WEISL. Admiral Burke, have you had sufficient funds with which to create the greatest capability that you need to detect Soviet submarines?

Admiral BURKE. No, sir. We have used our funds that have been made available to us as best we can, but we need more; we have needed more funds for research. We need more funds for the equipment after we have gotten it, to install the equipment in our ships and in our aircraft.

Mr. WEISL. Is the lack of funds a very serious deterrent to your getting the right detection and other devices to protect the United States against submarine attack by the Soviet Union?

Admiral BURKE. Yes; because research effort, production effort, is nearly directly proportional to the funds available for that effort.

Now, whether or not if we had had more funds one of the scientists would have been able to make a tremendous breakthrough in detection, we don't know, but the effort would have been greater, and the chances are that we would have progressed further.

Mr. WEISL. In other words, you have not had sufficient funds to get the greatest capability to protect the Nation against submarine attack.

Admiral BURKE. That is correct, sir. But I might add that we have never had sufficient funds to do those things in other lines of endeavor, too. And that is true, I think, perhaps in all governmental agencies.

Mr. WEISL. I know it is, but I am talking about submarine detection, which apparently the United States—against which if we don't have submarine detection and don't have the funds to get it, this country may be in grave danger; is that not true?

Admiral BURKE. Yes, sir.

Mr. WEISL. What efforts are you making, Admiral Burke, to get sufficient funds for this purpose?

Admiral BURKE. We have stated our case, both before all the agencies which are concerned with the budget, and we have also stated them before the Congress.

We have abided by the decisions which have been made. We have tried to inform the people who were making the decisions of the dangers of enemy submarines, and above all, the tremendous length of time that it takes to design, develop, and equip new ships after you get the idea, and before you can get that idea into a capability.

Mr. WEISL. Has the money which Congress appropriated been denied allocation by the Budget Director or by the Comptroller of the Defense Department?

Admiral BURKE. In order to get the money, we have to go through an apportionment procedure, which is difficult.

Mr. WEISL. Has that difficulty in the apportionment procedure affected the speed at which you could get the devices that you need?

Admiral BURKE. Yes, sir; it is very difficult to tell exactly how much, but it has.

Mr. WEISL. In connection with the appropriations that have been apportioned, has the denial of the use of overtime on the part of

contractors delayed you in getting the equipment that you needed for submarine detection?

Admiral BURKE. Yes, sir; our ships and aircraft would have come off the line sooner.

Mr. WEISL. Then the denial of overtime has affected the speed at which you get the equipment that you need?

Admiral BURKE. Yes, sir. I would like to bring out these decisions that are made by people are made with a lot more factors than just the factors which I present to them.

Mr. WEISL. I know that, Admiral.

Admiral BURKE. Yes, sir.

Mr. WEISL. But what we are trying to find out, in view of the clear and present danger that the Nation faces, whether the United States Navy has got enough funds to enable it to protect this country, and whether overtime restrictions have prevented the Navy from getting the equipment that it has to have; and you say that they have?

Admiral BURKE. Yes, sir.

Mr. WEISL. Has there been a denial of sufficient manpower for your research laboratories, such as the Naval Research Laboratory?

Admiral BURKE. There are limitations on both military manpower and civilian manpower, and those limitations do affect the numbers of people in the laboratories, and they do affect the numbers of people who can operate the equipment.

Mr. WEISL. You, I presume, are acquainted with a letter which was sent by one of the executives of the Naval Research Laboratory, pointing out that the denial of funds has impaired him in his work?

Admiral BURKE. I have not seen the letter itself, sir, but I have been informed of the contents of the letter; yes, sir.

NAVY SENDS ENLISTED MEN TO SCIENCE SCHOOLS

Mr. WEISL. What steps has the Navy Department taken to train scientists? By "scientists," I take in technologists as well as scientists, all those technical people.

Admiral BURKE. Within the military service, that is, the uniformed people, we train a good many officers in postgraduate schools, various scientific courses. In addition to that, 2 years ago we started a course for bluejackets who had not had a college education and who were especially well qualified, in the universities. We started this off as a trial run 2 years ago. It was very successful. We doubled it last year, and the Secretary has recently increased it about 5 times its original or 6 times its original size. We hope to train about 500 bluejackets a year.

Mr. WEISL. That is, you will accomplish this by paying the tuition and expenses of students who show aptitude for science and technology?

Admiral BURKE. Who are already in the service.

Mr. WEISL. Who are already in the service.

Admiral BURKE. And they extend their enlistment so that they will stay in the service. In addition to that, each of our laboratories, although it is different in each laboratory, attempts to interest especially well-qualified high-school students in the work of the laboratory, in science in general, not so much for that particular laboratory but just for science in general, and we have had a very good response to that.

Mr. WEISL. Do these potential students whom the Navy will finance have to be officers or can they be enlisted men?

Admiral BURKE. They are 500 enlisted men a year.

Mr. WEISL. Five hundred enlisted men?

Admiral BURKE. Yes, sir.

Mr. WEISL. You pay their way through scientific or engineering or technological colleges?

Admiral BURKE. Yes, sir.

Mr. WEISL. Provided that when they graduate they agree to serve in the United States Navy for a period of time?

Admiral BURKE. Yes, sir; that is correct.

Mr. WEISL. Now, in order to meet the submarine menace, and I am stressing submarines, Admiral, because that seems to be the immediate danger, not that it is the only danger or even the most important danger, but it has been written about in the newspapers and the people are tremendously concerned. Do you have a force in being now, apart from what you need?

Admiral BURKE. Yes, sir; we keep at sea patrol aircraft, shore-based patrol aircraft. We have also hunter-killer forces at sea. We have our fleets, always have an antisubmarine capability with them, and then whenever we receive any small indications that there might be submarines in an area, we make special searches.

Mr. WEISL. Do you have sufficient forces in being? You have the responsibility, Admiral. If anything goes wrong, you will be blamed, so we want to know as clearly and as effectively as you can tell us whether you have sufficient forces in being to properly discharge your responsibility in defending against submarines?

Admiral BURKE. Mr. Weisl, I suppose that every military commander in the whole world has answered that question always, "No, sir."

Mr. WEISL. I know.

Admiral BURKE. And I have not either. The more forces we have, equipped with modern equipment, the better we will be able to do our job.

Mr. WEISL. I am sure of that, Admiral, but what the committee would like to know is what we can do now to help your forces in being, to strengthen them as quickly as possible?

Admiral BURKE. More forces would increase the capabilities.

Mr. WEISL. How could the Congress, how can this committee, help you get those forces?

Admiral BURKE. It takes money, sir. It takes money and it takes an increase in our manpower levels.

Mr. WEISL. Are your fleets equipped with modern equipment?

Admiral BURKE. No, sir; not altogether. This year will see our destroyers equipped with modern sonars. It has taken 6 or 7 years. That is the active-fleet ships. We need more equipment, both electronic and sonar equipment, in both our aircraft and our ships.

Mr. WEISL. Admiral, what are you doing, what is the Navy doing, to get that equipment? Are you presenting your case?

Admiral BURKE. Yes, sir.

Mr. WEISL. Strongly?

Admiral BURKE. Yes, sir, we are presenting our case just as strongly as we know how, and that is the reason, because we made an analysis of this. We make it every year over and over again, to make sure that

we are not making a mistake, and we took some very drastic steps this year in cutting back our forces, in cutting back our men, in cutting back our Shore Establishment, in order to get money for new equipment, new ships and new aircraft, sir.

Mr. WEISL. If your destroyers and your supporting ships in the fleet do not have modern equipment, they will be at a great disadvantage against the Soviet navy, which apparently, from all reports, has modern equipment.

Admiral BURKE. Yes, sir; that is certainly correct, and there is a lot of difference in the effectiveness of a destroyer or any other unit, depending upon your equipment. In a recent fleet exercise, the difference between a ship with a modern sonar and a ship without modern sonar is the difference between success and failure. One ship can gain contact, hold it and kill; the other ship without modern equipment does not even know a submarine is there sometimes under certain conditions.

Mr. WEISL. Will you in closed session, you and your associates, tell the committee what kind of equipment is so desperately needed?

Admiral BURKE. Yes, sir.

Mr. WEISL. We have been told and our investigation discloses that the Soviet Union not only has modern aircraft itself, but has supplied aircraft to its satellite countries. You have talked about a limited war, and we presume that these aircraft would be used in a limited war against the United States if the United States were engaged.

What part would the Navy play, if any, against such aircraft?

Admiral BURKE. Mr. Weisl, we are usually called upon very early in the game whenever there is a possibility of limited engagement, and it is true that Russia has supplied Egypt, Syria, and Red China with modern equipment, modern aircraft. Now, our carriers in many instances, in some instances, are the only way to get tactical airpower into the area of trouble. That means that the aircraft we will have to use have to be capable of meeting and defeating the enemy aircraft which will be used against them, and that means modern carriers, because new aircraft are heavy and they are fast and they cannot be operated from the old World War II carriers.

Mr. WEISL. You have the 6th Fleet in the Mediterranean; is that right?

Admiral BURKE. Yes, sir.

Mr. WEISL. And you have the 7th Fleet in the Pacific?

Admiral BURKE. Yes, sir.

Mr. WEISL. Now, should trouble arise in the Mediterranean, is the 6th Fleet equipped with the most modern equipment that it can get, or would you rather discuss that in closed session?

Admiral BURKE. I would rather discuss the exact equipment in closed session, but I might say that we have some new aircraft that are coming off the line that are very good. We would like to have more of them faster.

Mr. WEISL. I think in your statement you mentioned that the majority of your ships are getting old?

Admiral BURKE. Yes, sir.

Mr. WEISL. That you need replacements. Can you tell the committee about your shipbuilding program?

Admiral BURKE. This goes back a good many years.

Mr. WEISL. About what percentage of your fleet would you say consists of World War II ships?

Admiral BURKE. About 80 percent of our fleet now are World War II ships, and by 1965, at the end of the 20-year normal life of these ships, 50 percent of our fleet will still be these World War II ships. There will come a time when those ships simply will not run any more. They will just run down. They will not be capable of operation. That means that our shipbuilding bill, our shipbuilding rate of procurement, has not been big enough. Now, partly this was because right after World War II the ships were new then. We did not need a replacement after World War II, within the next 4 or 5 years. We did not start a shipbuilding program for about 5 or 6 years. That means that the shipbuilding program should be greater than if we had started right away.

Mr. WEISL. Does that obsolescence factor apply to our submarines as well as our other ships?

Admiral BURKE. Yes, sir; except the submarine life is less than the surface life of ships.

Mr. WEISL. Would you say that 80 percent of our submarines are old submarines?

Admiral BURKE. No, sir; the submarines are a little better off as far as modernity is concerned right now than the rest of the fleet, but a good many of them are, sir.

Mr. WEISL. I will not question you in detail about the Polaris, because I understand Admiral Raborn will appear before us and discuss the Polaris in detail.

Admiral BURKE. Yes, sir.

Mr. WEISL. But we do need submarines for the Polaris?

Admiral BURKE. Yes.

Mr. WEISL. When it becomes operational.

Admiral BURKE. Yes.

Mr. WEISL. Is your program sufficiently large to be ready with submarines when the Polaris is ready?

Admiral BURKE. Our Polaris submarine program is just starting now. We are going to have to increase our rate of production of these submarines a great deal. We are going to have to have a good many of those ships within 2 or 3 years. They are going to have to be laid down. We estimate that it probably will cost around a half-billion dollars a year for several years in order to get an adequate Polaris submarine capability.

Mr. WEISL. Whatever the cost, Admiral Burke, the committee will want to find out what we need in the way of submarines to launch the the Polaris when it is ready.

Admiral BURKE. Yes, sir.

Mr. WEISL. And you will tell that to the committee, I presume, in executive session?

Admiral BURKE. Yes, sir.

Mr. WEISL. Now, in the event of an all-out war, an attack on the United States by guided missiles, bombers, or otherwise, what part would the Navy play?

Admiral BURKE. The Navy has the 6th and 7th Fleets deployed all the time, and they are ready for action at any time. The other fleets, the condition of readiness varies, but when tension increases

such as it did during Suez, two-thirds of the fleet went to sea right away and they were ready for action in a very short while.

Mr. WEISL. Consistent with security, can you tell us how many aircraft carriers are in operation today?

Admiral BURKE. Yes, sir; there are 15 attack carriers in operation now, sir.

Mr. WEISL. And do these attack carriers carry long-range bombers?

Admiral BURKE. Well, they are medium range, sir. They carry a heavy-attack aircraft, which will carry thermonuclear weapons at distances of a thousand miles or slightly more.

Mr. WEISL. Could these aircraft with thermonuclear weapons, in the event of necessity, strike the heart of Russia, in the event that we were attacked?

Admiral BURKE. Yes, sir; they could strike the heart of Russia.

Mr. WEISL. We had a great deal of discussion about mobility in connection with the launching of intermediate missiles. Do you consider the aircraft carrier a mobile base for aircraft?

Admiral BURKE. Yes, sir.

Mr. WEISL. Please tell the committee about the mobility advantage of an aircraft carrier.

Admiral BURKE. Well, in the first place, it is a most difficult target to find. It looks easy in peacetime, but even in peacetime it is a difficult target to find.

Mr. WEISL. Tell us why it is a difficult target.

Admiral BURKE. Because, first, you do not know the exact position at any time. You have to search for it, and that means a considerable effort to search a lot of ocean.

With decoys, electronic devices, jamming techniques, and other things, it is difficult to tell the difference between an aircraft carrier and other targets at sea, so that you cannot identify it.

It is difficult to identify unless you see it, and by the time a search plane gets close enough to see it, he is in very great trouble.

Now, the reason for that is that when—it is the fact that an attack cannot be launched against a carrier or a carrier task force just to go out and find a carrier task force and strike it. The striking force should have the location known before it strikes. That means they have got to launch search planes first.

The search planes, since the carriers will be protected by picket ships, heavy support ships, its own aircraft, the search planes run into hazards just as soon as they get anywhere near the vicinity of the pickets, and they are very likely to be shot down. If they are not, and they do get a position report in, then the enemy launches its strike aircraft; they come out and they have to go through a terrific defensive screen before they can ever reach a carrier; first, aircraft, then missiles, and then aircraft again, and then the missiles from the ships that are right close to the carriers.

Now, in many of our exercises some of our own people in conducting strikes against our carrier striking force will underestimate, and when they underestimate they lose completely. They don't get any planes through. It takes a terrific effort, and then they have to be very fortunate.

Senator SALTONSTALL. Mr. Weisl, would you yield for one question?

Mr. WEISL. Certainly.

Senator SALTONSTALL. Isn't that aircraft carrier going at a relatively fast rate of 32 or 36 knots all the time?

Admiral BURKE. Yes, sir; it is moving all the time, and takes advantage of weather, everything else.

Senator SALTONSTALL. So all this outfit you just described is moving at a rate of 30 knots?

Admiral BURKE. Yes, sir; it is moving at high speed, and it is changing its course frequently, so that a report of a course and speed one time is not true an hour later.

Mr. WEISL. So that an aircraft carrier can cover about 800 miles in a day.

Admiral BURKE. It can move at about 30 knots.

Mr. WEISL. At about 30 knots an hour?

Admiral BURKE. Yes, sir.

Mr. WEISL. Does an aircraft carrier play any part in antisubmarine warfare?

Admiral BURKE. Yes, sir.

An aircraft carrier is one of the most useful weapons, and the reason for that, it is much better to get submarines at their bases in the bays and the fiords.

We know that Russia has built a good many mother ships. They said so. She intends to use those ships by deploying the tenders to places which are probably not very well known to us, certainly not known now, so we are going to have to search for those places, and then we are going to have to strike them just with airpower. We are not going to get through easily.

Now, there is no other way that we can get in except with a heavy attack that can come from carriers.

Mr. WEISL. Do you have sufficient funds in the Navy to train properly your jet flyers on these carriers? I will tell you, Admiral, why I asked the question.

Admiral BURKE. Yes.

Mr. WEISL. In the course of our investigation we have been told that jet flyers get as little as 2 hours per month proficiency flying.

Admiral BURKE. Not in the carriers, sir. We do have to restrict flight hours. We have had to restrict flight hours. That is very bad.

Our jet pilots, we keep up to a minimum standard, but they frequently barely get the minimum standard and, of course, the more flight time that a man has, the more proficient he becomes, and operating close to the minimum all the time does make him a less efficient pilot than if he had more flight time.

Mr. WEISL. Admiral, don't you think it is a pretty dangerous proposition not to have enough funds to train properly our jet flyers on whom we depend to strike at the enemy and protect the security of the United States?

Admiral BURKE. Yes, sir; they are trained to a minimum amount, but it would be a lot, we feel a lot better if we could fly them more; yes, sir.

Mr. WEISL. Is it not an absolute necessity to fly them more? Is a minimum amount sufficient to train them?

Admiral BURKE. Yes, sir. The minimum amount is sufficient. When a pilot gets below a minimum amount, we don't permit him to fly.

Mr. WEISL. Well, is 2 hours a month flying for proficiency flying enough?

Admiral BURKE. No, sir.

I don't know what that report is, but there is, I am sure, something unusual about that particular report, sir.

It may be that a pilot will only fly 2 or 3 hours in a particular month due to various reasons such as illness or being in transit to a new duty station. Also there were instances reported in the latter part of fiscal year 1957 of some Naval Reserve pilots who flew such a small amount during a month. Funds to permit planned flight operations are allocated to those stations or units controlling local flying. It can occur, after periods of high flight activity, that a station may have to reduce flight operations for a corresponding period to remain within its budget. However, these are temporary reductions over short periods. Each pilot is expected to plan his flying in order to maintain prescribed minimums or satisfy specified flight syllabuses over the year.

Mr. WEISL. We heard the testimony of General Doolittle who said that one of the reasons he quit the flying service was that there wasn't enough flying time allotted.

Admiral BURKE. That is correct, sir.

You must fly, you must maintain a proficiency or you are dangerous to yourself and other people, too, sir.

Mr. WEISL. Shouldn't that point be made clear to this committee so that this committee can recommend whether its fliers are having enough training to be proficient and safe?

Admiral BURKE. Yes, sir.

We would like very much to have more flight time, and more flight time would increase our proficiency; but we are caught—if we cannot get enough flight time for all of our pilots we will have to ground our pilots, and that is what we do sometimes.

The Secretary has just given me the average flight time, average pilot time of all pilots for 1955 to 1959.

In 1955 we averaged 17½ hours per month; in 1959, we will average 14.3.

Mr. WEISL. In 1955?

Admiral BURKE. In 1955 we averaged 17½; in 1957, 16; in 1958 it is an estimate yet, 14.6; and in 1959, the estimated will probably be around 14, somewhat, about similar to 1958.

Mr. WEISL. I believe, Admiral, that General Doolittle testified that any training under 20 hours a month is insufficient and borders on the danger point from the standpoint of proficiency and safety of the pilot. Do you agree with that?

Admiral BURKE. No, sir.

I think there is a limit, there is a low limit. I don't agree with that particular number. I am not a pilot.

Mr. WEISL. I understand.

Admiral BURKE. And I would prefer to have that specific question answered. There will be instances when a man does not get enough flight time in order to keep him fully qualified but, in general, if you don't have enough flight hours to keep a man basically qualified, why, then, you would ground him—you wouldn't let him fly—and that we have had to do.

Now, I would like to say again that these restrictions in flight hours do decrease efficiency. It decreases our effectiveness.

Mr. WEISL. Don't you think it is dangerous to the national security to have to ground flyers that are needed?

Admiral BURKE. Well, it is not good for it, sir.

Mr. WEISL. Well, you will have prepared for the committee evidence on that point, so that they can, if necessary, make some judgment and recommendation?

Admiral BURKE. Yes, sir.

(Subsequently the Department of Navy filed the following memorandum with the subcommittee:)

Naval aviators can be divided into three general categories so far as their annual flight time is concerned. These categories are:

(a) Naval aviators assigned to operational duties—assignments primarily concerned with flying aircraft.

(b) Naval aviators assigned to nonoperational duties—assignments primarily administrative in nature. These aviators must maintain their proficiency while so assigned in order that they will not have to be completely retrained when they return to operational assignments and so that they can retain the "pilots' viewpoint" as they perform administrative duties that vitally concern aviation matters.

(c) Reserve naval aviators in a drill pay status—our "weekend warriors" who combine civilian life with readiness for active naval duty.

The minimum amount of flying differs for each of these categories. These are minimums that we are forced to accept due to stringency of funds and are not satisfactory.

(a) Naval aviators in operational billets.

(1) In recent years (1955-57) pilots in operational billets have averaged about 300 flight hours per year (25 hours per month). This may be further analyzed on the basis of the type aircraft flown.

(2) Pilots of jet-type aircraft averaged 230 hours in fiscal year 1956 (19 hours per month) and a little less in fiscal year 1957. The Navy will strive to keep jet pilots at about the 20-hour-per-month level.

(3) Pilots of propeller-type aircraft averaged about 360 hours in fiscal year 1956 (30 hours per month) and a little less in fiscal year 1957. Pilots of propeller-type aircraft will continue at about this level.

(b) Naval aviators in nonoperational billets.

(1) Pilots in these billets average about 100 flight hours per year (about 8.5 hours per month). A minimum of 90 flight hours per year (7.5 hours per month) has been established by the Navy as that required to maintain flight proficiency.

(c) Naval aviators in organized Reserve squadrons.

(1) A syllabus of 100 hours per year (8.5 hours per month) has been established for aviators in this category. In recent years they have averaged about 78 hours per year (6.5 hours per month). Pilots, so assigned, should maintain or better this average to retain proficiency.

Mr. WEISL. You spoke about the fact that the missile will never replace the manned bomber. "Never" is a long time, and you probably are right, but maybe you could give the committee shortly or in brief terms your reasons for that feeling.

Admiral BURKE. If I said "never," sir, you are quite right, it is too long a time.

Mr. WEISL. You may not have said "never." I may have misheard you.

SOME THINGS ONLY A PILOT CAN DO

Admiral BURKE. It will be a long time before manned aircraft will be replaced entirely by missiles. But there will be some replacement, and the reason for that is that there are a lot of things that a pilot can do that an unthinking missile cannot, and one of the most important is reconnaissance. There is no way that we have yet of having adequate reconnaissance except by manned aircraft.

Another one is precision work. A missile, even a guided missile with an excellent homing head, is not nearly as precise as a manned aircraft can be.

Another one, the most important one, perhaps, is a judgment factor. The pilot can exercise judgment in his operations. A missile cannot.

Mr. WEISL. Admiral Burke, Admiral Raborn will testify as to the Polaris, so I won't question you in detail about that; and Admiral Clark, I understand, will answer about research and development, so I won't question you about that, unless you would like to say something to the committee in that connection.

Admiral BURKE. No, sir. They will give adequate information.

Mr. WEISL. Admiral Hayward, I understand, will also testify on research and development.

Admiral BURKE. Mr. Norton, I think, will.

Mr. WEISL. I mean Admiral Hayward will testify on research and development, and Admiral Clark on missiles.

Admiral BURKE. Yes, sir.

Mr. WEISL. Is there anything further that you would like to tell the committee that I haven't asked about, Admiral Burke?

Admiral BURKE. No, sir; I think not.

Mr. WEISL. Thank you very much.

Mr. Chairman, that is all I have to ask.

Senator JOHNSON. Senator Saltonstall?

Senator SALTONSTALL. Thank you, Mr. Chairman. Just a very few questions.

Admiral Burke, do you think, as Chief of Naval Operations, there should be any changes in the Unification Act?

Admiral BURKE. No, sir. The organization as it is now designed, as it is now with the Reorganization Plan No. 6, I think is an effective organization.

Senator SALTONSTALL. Are you satisfied with the organization of the Joint Chiefs of Staff? I might add, there have been some suggestions up here for changing the organization of the Joint Chiefs of Staff. General Doolittle mentioned it, Dr. Bush, and General Gavin; and today another witness.

Admiral BURKE. I am not satisfied with the work, with the product, with the organization, even, of the Joint Chiefs of Staff, or any other organization. It can be improved. There have been a good many proposals in the past. A lot of them have been examined, and there is some merit to them in some instances.

But all in all, this organization is good, basically good, and there are a lot of reasons for that.

First, in any of these organizations, such as the National Security Council, Department of Defense, the Joint Chiefs of Staff, the Congress itself, all the big organizations who have difficult problems to solve, it depends a great deal, the solution, the proper solution of the problem depends a great deal upon the people, upon the judgment of the people, upon the knowledge and education and experience that the people who are trying to solve those problems have had.

Organizations are important, but the thing that is of primary importance is the people who are in them, the people who make them work.

Now, in any big organization, it does not matter much whether it is in business or any other organization, the flow lines on a chart are never exactly followed. The organization actually operates depending upon the personalities of the various people that are in the various spots.

Senator SALTONSTALL. Well, broadly speaking, then, you do not think any legislative action is needed on the Unification Act? You

think it is a question of personalities and working it out with personalities rather than changing the fundamental law?

Admiral BURKE. Yes, sir. I haven't seen a proposal yet that I think would solve the problems which confront the Joint Chiefs.

Senator SALTONSTALL. Are you satisfied with the present roles and missions as defined?

Admiral BURKE. Yes, sir. As far as—you mean now as a Chief, or as the Chief of Naval Operations?

Senator SALTONSTALL. I am speaking to you as Chief of Naval Operations, and also as an individual.

Admiral BURKE. Well, the Navy's roles and missions are all right. There are still areas that perhaps can be clarified in missile warfare that exist between the Navy, between the Army and the Air Force, but those are problems, the solution of which will be evolved.

Senator SALTONSTALL. Is there enough overall authority now in the Secretary of Defense, in your opinion, to accelerate a program, as desired, and to give overall direction to the three armed services?

Admiral BURKE. Yes, sir. He has authority to modify, direct as as he pleases, sir, within the limitations put down in appropriations and such things.

Senator SALTONSTALL. So there again, it is a question of personality, and using the authority that he now has?

Admiral BURKE. Yes, sir.

Senator SALTONSTALL. Just 1 or 2 other questions.

We talked, you talked a minute ago about the number of submarines and the number of new submarines. The question of new submarines has been somewhat held up, has it not, pending the decision as to the effect of the *Nautilus*? Is that a fair statement?

Admiral BURKE. Yes, sir. It has been, because there have been tremendous improvements. The *Nautilus*, the *Albacore*, these improvements have come along fairly fast, and it is not wise to build too many submarines when you can see improvements in the next—or too much of anything if you can see improvements in the next year or so that will make a significant difference in the capabilities of the equipment.

But now those have been incorporated, and we think that submarines that we are producing now are extremely good.

Senator SALTONSTALL. And the fact that we have fewer submarines, and that is public knowledge, than the Soviets have, is not a sign of weakness in our Navy, but rather a sign of a different mission for our Navy; is that correct?

Admiral BURKE. That is correct, sir.

Russia has a completely different naval problem than we have. We have to use the seas for us to be successful.

We have got to use this Atlantic Ocean and the Pacific Ocean in order for us to do anything in Europe or the Far East.

We have got to use them and we have got to have the power to use it no matter what happens.

Now Russia on the other hand is a land where all of her interior lines are land lines. She does not have to use the seas but her big purpose in naval warfare will be to defy us to use the seas, to prevent us from reaching Europe and Asia.

In order to do that she should build a lot of submarines, inshore combat craft, destroyers, torpedo boats and that sort of thing, and that is exactly what she has done.

Now, the difference is that we have to not only control the seas and use the seas, whereas all that she has to do is to deny us the use of the seas, and it takes two entirely different types of navies to do those entirely different functions.

Senator SALTONSTALL. On the other hand, as has been brought out before this committee, the submarine can be used today for launching a missile against continental United States, can it not? That is one of the problems the Navy has, to stop that?

Admiral BURKE. Yes, sir.

We have missile-launching submarines and we have to be able to stop Russia's submarines from reaching anywhere near our coast.

Senator SALTONSTALL. Now it is also true, is it not, that our submarine detective methods and instruments have been enormously improved since World War II.

Admiral BURKE. Yes, sir. Our sonars have increased. The ranges have increased several times. Our electronic radar devices have increased many times.

We have other new systems which permit us to pick up submarines by methods we did not have during World War II.

We have increased but we have not yet reached the stage where we feel confident that we can handle a large number of nuclear-powered submarines with their high sustained underwater speeds.

We are going to have to do more work on that.

Senator SALTONSTALL. And the Navy today is becoming more and more satisfied that the nuclear-powered submarine is submarine of the future; is it not?

Admiral BURKE. That is right.

Senator SALTONSTALL. As well as the nuclear-powered cruiser and destroyer?

Admiral BURKE. Yes, sir, the nuclear-powered submarine, I think we will never build another conventional powered submarine.

Senator SALTONSTALL. Admiral, I know our time is short tonight and my good friend on the right here has said to slow down a bit and I will because I know we all want to get home and I am sure you do.

Let me ask you just one more question on missiles.

Now one of the primary functions of this committee is to determine if the missile programs cannot be accelerated.

In your opinion, are the new orders given by Secretary McElroy, giving Mr. Holaday more power over missile development satisfactory, is it sufficient in your opinion?

Should there be more, and if so, what?

Admiral BURKE. Well, as nearly as I can gather, Senator, he has the power to do anything he wants to do with missiles.

He can start, stop, change—I think he has plenty of power.

Now if somebody disagreed with what he proposed to do, I am sure that they would take difference of opinion directly to the Secretary of Defense but I think that he has complete authority, and I don't see how he could use any more, sir.

Senator SALTONSTALL. And there is not undue waste from the competition angle?

Admiral BURKE. No, sir.

Senator SALTONSTALL. Up to the present time?

Admiral BURKE. No, sir; it has been a very short time, sir, but there does not seem to be any, sir.

Senator SALTONSTALL. Thank you very much, Admiral Burke.

Senator JOHNSON. Senator Stennis?

Senator STENNIS. Admiral Burke, I have been very much interested in your statement. I will be very brief here in the interest of time.

I want to put this question now: Your missile program has been separated from that of the Army. Without passing on the merits of anyone else's missile program, has your program been able to move along faster or better because it was separated and put out on a separate mission, your missile program, the Navy missile program?

Admiral BURKE. Yes, sir.

You mean the ballistic missile?

Senator STENNIS. Yes, sir.

Admiral BURKE. Yes, sir. We think it has been better since we separated it because we were trying to marry the different requirements of our two services and it became a very complex sort of system but I might say when we were working with the Army in Jupiter we have never had any better cooperation.

They were excellent.

They kept us fully informed. They did everything that we could think of to have done, and their cooperation was very good, but they could use very effectively the liquid propellant.

They could use a big missile, the size of the missile would not make very much difference to them.

We, as soon as we got far enough along in solid propellants to indicate we had a possibility of success in solid propellants and could make a small missile that could go just as far and do just as much, we asked if we could develop that missile and were granted permission to do so.

Senator STENNIS. So up to a stage the work was all in common and you pulled out after it got to where you had a special project of your own to fit your needs.

Admiral BURKE. Yes, sir; although we are kept very well informed. I think there is very good exchange of information among the services on their missile programs.

Senator STENNIS. What new facilities, if any, have you had to develop because of your separate programs, new facilities?

Admiral BURKE. We have not had to develop any new governmental facilities, sir.

We have had contractors of course, but no governmental facilities.

Senator STENNIS. Well, has that involved any heavy expenditures, these new facilities?

Admiral BURKE. No, sir, no sir; we think actually the missile being produced will be quite a bit cheaper than any other types of missile.

Senator STENNIS. Your statement here on page 10 of the mimeographed copy—I don't know what page it is for you.

Admiral BURKE. Yes, sir.

Senator STENNIS. But all of that statement pertains to Polaris.

You wind up by saying, "We think Polaris weapons system."

Admiral BURKE. Yes, sir; that is correct, sir.

Senator STENNIS. But all the preceding paragraphs there have related to Polaris; is that correct?

Admiral BURKE. Yes, sir.

Senator STENNIS. Very well, that is all I have, Mr. Chairman.

Thank you, Admiral Burke.

Admiral BURKE. Thank you, sir.

Senator JOHNSON. Admiral Burke, we thank you for the testimony and the contribution you have made to the deliberations of this committee.

The committee will stand in recess until 9:30 Monday morning.

(Whereupon, at 6:10 p. m. the committee was adjourned, to reconvene at 9:30 a. m., Monday, December 16, 1957.)

INQUIRY INTO SATELLITE AND MISSILE PROGRAMS

MONDAY, DECEMBER 16, 1957

UNITED STATES SENATE,
PREPAREDNESS INVESTIGATING SUBCOMMITTEE,
OF THE COMMITTEE ON ARMED SERVICES,
Washington, D. C.

The subcommittee met, pursuant to recess, at 9:30 a. m., in room 318, Senate Office Building, Senator Lyndon B. Johnson (chairman of the subcommittee) presiding.

Present: Senators Johnson (Texas), presiding, Kefauver, Stennis, Symington, Bridges, Saltonstall, and Flanders.

Also present: Senators Bush and Barrett, members of the Committee on Armed Services;

Edwin L. Weisl, chief counsel; Cyrus R. Vance, counsel; Gerald Siegel, associate counsel; Solis Horwitz, associate counsel; Daniel F. McGillicuddy, associate counsel; Stuart P. French, associate counsel; Edwin L. Weisl, Jr., assistant special counsel; Dr. William Houston, consultant; Dr. Homer Joe Stewart, consultant; and Edward C. Welsh, staff adviser.

Senator JOHNSON. The committee will come to order.

Before resuming the hearings this morning, I would like to make a brief announcement for the information of the committee and others.

Over the weekend, I have reviewed the material gathered by the staff. It indicates that our record will not be complete without a further presentation of testimony from industry groups and an amplification of testimony already given by the Defense Department.

During the course of the day's hearings, I am going to confer with the members of the committee in an effort to set a date for the next series of hearings. I hope it can be arranged for a time early in January.

I believe that all who have followed the hearings so far will agree with me that they have been very revealing. They have disclosed a situation in which a dedicated group of men have been working hard to develop physical weapons of security but have been hampered by confusion stemming from many sources.

I would like to stress once again that the objective of the committee is to find positive steps that will produce the weapons of security faster and more effectively. Testimony of the past few days has been very helpful in this respect.

It seems to me evident that we have the brainpower, the resources, and the dedicated enthusiasm to get the job done. Our problem is to channel those qualities into the most effective path.

Today we are going to hear the experts of the Navy, who I hope come to us with plans for expediting their end of the program.

667

Our first witness this morning is Lt. Gen. Verne J. McCaul, Acting Commandant of the Marine Corps.

General McCaul, we have long recognized the historic importance of the Marine Corps. Your service has managed to adapt itself to the technological changes of military history. Our country is fortunate that you have that capacity. We are proud of the role that you have played.

Will you please stand and be sworn, General?

Do you solemnly swear that the testimony you give this committee will be the whole truth and nothing but the truth?

General McCaul. I do.

Senator JOHNSON. General, we are delighted to have you as the witness this morning.

Counsel, will you proceed with the witness?

(The biography of Lt. Gen. Verne J. McCaul is as follows:)

LT. GEN. VERNE J. MCCAUL, UNITED STATES MARINE CORPS

Lt. Gen. Verne James McCaul, a veteran marine flier, and twice winner of the Legion of Merit for outstanding service in World War II, is now serving at Marine Corps Headquarters, Washington, D. C., as Assistant Commandant of the Marine Corps.

In World War II the general saw action in the Battle of Midway, the northern Solomons, and the southern Philippines. He first earned the Legion of Merit as executive and operations officer of Marine Aircraft Group 22 when it won the Presidential unit citation for its heroic fight at Midway. The other Legion of Merit was for outstanding service in the Philippines from February to July 1945, as deputy commander, Marine Aircraft Groups, Zamboanga; commander, Support Aircraft; and commander, Marine Aircraft Group 12. That group was awarded the Presidential unit citation, in part of its service under General McCaul while supporting Filipino guerrilla units fighting on Cebu Island. In addition, Marine Aircraft Groups, Zamboanga, won the Navy unit commendation for its support of the United States Eighth Army on Mindanao and in the Sulu Archipelago while the general was deputy commander.

General McCaul was born August 18, 1903, at Ayr, N. Dak., where he attended public schools until he entered the preparatory school of the North Dakota Agricultural College, where he obtained his degree. Commissioned a marine second lieutenant, July 21, 1925, he was ordered to the Marine Barracks at the Philadelphia Navy Yard, where he completed the Basic School for Marine Corps officers that December.

In October 1927, after a tour of duty at the Marine Barracks, naval station, New Orleans, La., the general was assigned to the Marine detachment aboard the aircraft carrier *Saratoga*. He returned from sea duty in December 1929, to enter flight training at Pensacola, Fla., and after winning his wings, was ordered to Aircraft 2 at the naval air station, San Diego, Calif., in August 1930. He remained there until March 1935, then served for 3 months aboard the U. S. S. *Langley* during fleet maneuvers. After that he was stationed at Marine Barracks, Quantico, Va., from June 1935 until May 1936. The following month he began a 2-year tour of duty in the Virgin Islands.

General McCaul returned to Quantico in June 1938, and after completing the junior course in the Marine Corps Schools, remained there as assistant operations and air liaison officer of the First Marine Brigade. With that unit he participated in Caribbean maneuvers from January to March 1940, and from October 1940 to February 1941. He was named executive officer of Bombing Squadron 1, First Marine Aircraft Group, in March, 1941, and after serving briefly in that capacity at Quantico, joined the Second Marine Aircraft Group in Hawaii that June. The following month he took command of Marine Fighter Squadron 221, which was assigned to the U. S. S. *Saratoga* when the Japanese struck Pearl Harbor.

Within 24 hours of the attack the general and his squadron were ordered to Wake Island with a force sent to aid that island's hard-pressed defenders. However, because of the hopeless situation there, the relief expedition was ordered to turn back and General McCaul, with the squadron, was transferred

from the *Saratoga* to Midway Island. There the squadron joined Marine Aircraft Group 22 and General McCaul became executive officer of the group.

Following the Battle of Midway, General McCaul joined Marine Aircraft Group 23 in August 1942. He also served briefly as a liaison officer with the commander in chief, Pacific, before returning to the United States that October for duty in Washington on the staff of commander in chief, United States Fleet.

In April 1944, he was ordered from Washington to Cherry Point, where he became executive officer of the 9th Marine Aircraft Wing. He served briefly in that capacity and for a short time as commander of a fighter group at Congaree Field, S. C., before returning to the Pacific theater that October to serve as chief of staff, air, northern Solomons. He took command of Marine Aircraft Group 12 in February 1945, and after commanding that group in the Philippines and at Peiping, China, returned to the United States in March 1946, to become chief of staff of the 1st Marine Aircraft Wing at Cherry Point.

In July 1947, General McCaul entered the National War College at Washington. He graduated in June 1948; then served on aviation duty with the Office of the Chief of Naval Operations for a year before he was assigned to the joint strategic plans group of the Joint Staff in July 1949. He then took command of Marine Air Reserve training at Glenview, Ill., in August 1951.

In August 1952, the general returned to Washington to serve a year at Marine Corps Headquarters as Director of Information. Ordered to Korea the following August, 1953, he served there as assistant commander of the 1st Marine Aircraft Wing until March 1954, when he became commanding general of the wing. He returned to the United States to take command of the 2nd Marine Aircraft Wing at Cherry Point in October 1954.

Following this assignment, he assumed duties as commanding general, aircraft, Fleet Marine Force, Atlantic, on December 27, 1955, at Norfolk, Va., meanwhile retaining command of the 2d Wing until he was relieved the following month.

General McCaul assumed the position of Assistant Commandant for Air and Director of Aviation on April 1, 1957, and on the same date received his promotion to lieutenant general. He assumed his present position on December 1, 1957.

In addition to the Legion of Merit with combat V and gold star in lieu of a second, General McCaul's medals and decorations include the Presidential Unit Citation Ribbon with 2 bronze stars, the Navy Unit Commendation Ribbon, the American Defense Service Medal with base clasp, the Asiatic-Pacific Area Campaign Medal with 3 bronze stars, the American Area Campaign Medal, the World War II Victory Medal, the China Service Medal, the National Defense Service Medal, the Korean Service Medal, the United Nations Service Medal, the Philippine Liberation Ribbon with 1 bronze star, and the Chinese Order of the Purple Cloud and Banner.

TESTIMONY OF LT. GEN. VERNE J. McCAUL, USMC, ACTING COMMANDANT, UNITED STATES MARINE CORPS

Mr. WEISL. General McCaul, would you be good enough to tell the committee what your responsibility and authority is in the Marine Corps at this time.

General McCAUL. I have just recently been appointed Assistant Commandant, air. I am the Executive Director of Aviation for the Marine Corps, and at the moment I am Acting Commandant, inasmuch as General Pate is in the Pacific on an inspection trip.

Mr. WEISL. Would you be good enough to talk into the microphone, General, so that everyone here can hear you?

General McCAUL. I thought I was getting on the air. I am Assistant Commandant for the Marine Corps and Acting Commandant in the absence of General Pate, who is out in the Pacific on an inspection trip.

Mr. WEISL. Thank you, General. Is there a statement, General, that you would like to read to the committee?

General McCaul. I have a brief statement which I would like to read to the committee.

Mr. WEISL. Would you be kind enough to read it, please?

General McCaul. My presentation on behalf of the Marine Corps will be brief. In the first place, we are not deeply involved in the type of missiles which are the principal concern of this inquiry.

Secondly, unlike the larger military services—

Mr. WEISL. General, if you will pardon the interruption, I believe Senator Saltonstall is particularly interested in your presentation, and, if you will be kind enough to wait so he may hear your statement, I will appreciate it.

General McCaul. Thank you, sir. I will start over again, if I may.

My presentation on behalf of the Marine Corps will be brief. In the first place, we are not deeply involved in the type of missiles which are the principal concern of this inquiry.

Secondly, unlike the larger military services, the Marine Corps does not maintain technical bureaus or services for the development of military hardware.

For development, we rely principally on the technical bureaus of the Department of the Navy or the technical services of the Army, contributing both funds and personnel in support of projects in which we have an interest.

The Marine Corps determines its requirements and develops the military characteristics of the weapons and equipment it needs in the performance of its military functions. Having formulated these characteristics, we shop around to determine what agency is in the best position to develop a particular item. Once this agency is selected and the project undertaken, we monitor development, consulting with and assisting the developing agency.

For example, Lacrosse, which was originally conceived by the Marine Corps, is being developed by Army ordnance. After development, we test the item and accept it as is or request modification to insure that its performance is satisfactory. Marine Corps general procurement follows this same pattern. Of the material purchased for the Marine Corps, approximately 61 percent is purchased for us by the Army, 23 percent by the Navy, and 1 percent by the Air Force, with only 15 percent being purchased directly by the Marine Corps from contractors. These arrangements have worked to our satisfaction, and we plan to continue them.

The Marine Corps requirements for, and use of, missiles are determined by its military functions, as set forth in the National Security Act. Briefly, these are to provide landing forces for the fleets and provide forces-in-being ready on a moment's notice to move to any trouble spot. These expeditionary forces, specifically designed to effect a landing from the sea against opposition of any character, have the truly impressive strategic mobility of the fleets themselves and, with the support of the fleets, a great capacity for independent action. They are an indispensable element of this Nation's ability to conduct military operations on and from the sea. In addition, they are the principal mobile force in readiness to deter and to oppose the type of ambiguous threats to our security which only the Kremlin seemingly can so skillfully devise.

Paradoxically, sputnik and the other Soviet advances in weapons technology, far from reducing the probability of such limited war threats, actually increase them. The massive nuclear capabilities of both the United States and the Soviet Union serve to prevent the posing of situations which could lead to mutual extinction. The Kremlin bosses must walk with care—even as they did when the United States enjoyed a monopoly of atomic weapons—but the Soviet Union's attainment of a competent nuclear capability will give it greater freedom of action.

Senator SYMINGTON. Mr. Chairman, may I ask, has the witness got a copy? If he is going to have a long written statement, I would like to have a copy of it so I can follow it.

General McCaul. Sir, we should have many copies here.

Senator SYMINGTON. Thank you very much. I have one now. It was not in front of my desk. I beg your pardon.

General McCaul. Our natural reluctance to unleash the total war which would result in our destruction as well as that of the Soviet Union gives the Communists greater latitude in both political and limited military action. These are not new tactics. Actually they have been the keystone of modern Communist expansion: political action combined with limited military action. They are tactics that are particularly suited to the present framework.

It is for these reasons that the role of the Fleet Marine Forces has never been more significant than it is today. During recent months these forces have been deployed globally in support of national policy. Quietly and without fanfare, they have exerted a reassuring and stabilizing influence in such farflung locations on the Eurasian rimland as the eastern Mediterranean, Persian Gulf, Indian Ocean ports, the Philippines, Okinawa, and Japan. And they have done it without the difficulties so often associated with basing troops on foreign soil, and done it in areas where to base forces locally is either impracticable or impossible.

What are the missile requirements associated with these statutory functions? The Marine Corps, of course, has no requirements for the ICBM. Neither do we have any requirement for the IRBM. But we are vitally concerned that the Navy have long-range ship-based missiles, such as Regulus and Polaris, capable of assisting in the neutralization phase of landing operations.

The primary characteristic of missiles for the landing force is mobility: We must be able to take them aboard ship, land them by helicopter or across the beach, and finally employ them ashore. They must have a high degree of battlefield mobility, which simply means a weapon we can readily move, supply, and employ under battlefield conditions.

We have, now in use in the Fleet Marine Force, the first mobile surface-to-air missile system in the free world. This system, built around the Navy Terrier missile, gives us a missile capability now, and will provide the organization and skills for expansion.

What about range characteristics? With today's weapons and today's tactics, the landing area is much more extensive than formerly. Enemy troops and installations within a radius of several hundred miles may be able to interfere with the landing. As I said before, we do not need nor do we want anything approaching the 1,500-mile range of the IRBM. Neither could such a weapon be designed to satisfy

the amphibious mobility characteristics which will always constitute a limit on the weight and range of landing force weapons. If support of this nature is required, it can best be provided by supporting naval forces. But within the limitations which are implicit in our primary criterion, amphibious mobility, we will exploit the range growth potential of the weapons we now have and of those we hope to get in the future.

TYPES OF MISSILES NEEDED

- With the military characteristic of amphibious mobility as a primary consideration, the landing forces has a requirement for all four general types of missiles: Surface-to-surface, surface-to-air, air-to-air, and air-to-ground. And with respect to all types, our position is gradually improving.

As I stated at the outset, all of the missiles we now have or expect to get come from either Army or Navy sources. They are modified as required to meet the peculiar needs of the Marine Corps. Of the Army missile programs which were presented to you earlier, the Marine Corps has requirements for the Lacrosse and Hawk. We now have Honest John in operational units, to be replaced by Little John if the latter weapon develops satisfactorily.

The Terrier, which we now have in operational status, is a Navy missile, as are also our present and projected missiles in the air-to-air and air-to-ground categories. Our marine fighter aircraft are either equipped with or programmed for the air-to-air Sidewinder or the Sparrow—weapons of high kill probability.

More deadly and longer range versions of these are in the mill. For close air support of ground troops, a specialty of ours, we plan to use the Bullpup, in the development of which marine project officers in the Bureau of Aeronautics are closely working with the Navy. The status of these missile programs will be described in the Navy presentation to follow.

In closing, I would like to make an observation which seems of transcendent importance to us. In meeting the new threat posed by Soviet advances in long-range missiles, this country must not think in terms of missiles alone. To concentrate upon missiles to the exclusion of other important weapons is to harm our cause and play into Soviet hands.
